THIRD SERIES.

THE
FARMER'S MAGAZINE,
AND
MONTHLY JOURNAL
OF
THE AGRICULTURAL INTEREST.

Dedicated
TO THE
FARMERS OF THE UNITED KINGDOM.

LONDON:
PUBLISHED BY ROGERSON AND TUXFORD, 265, STRAND.
PRICE TWO SHILLINGS.

IMPORTANT TO FLOCKMASTERS.

THOMAS BIGG, Agricultural and Veterinary Chemist, by Appointment to his late Royal Highness The Prince Consort, K.G., Leicester House, Great Dover Street, Borough, London, begs to call the attention of Farmers and Graziers to his valuable **SHEEP and LAMB DIPPING COMPOSITION**, which requires no Boiling, and may be used with Warm or Cold Water, for effectually destroying the Tick, Lice, and all other insects injurious to the Flock, preventing the alarming attacks of Fly and Shab, and cleansing and purifying the Skin, thereby greatly improving the Wool, both in quantity and quality, and highly contributing to the general health of the animal.

Prepared only by Thomas Bigg, Chemist, &c., at his Manufactory as above, and sold as follows, although any other quantity may be had, if required:—

4 lb. for 20 sheep, price, jar included.....	£0	2	0
6 lb. 30 " " " " " " " " " " " " " " " "	0	3	0
8 lb. 40 " " " " " " " " " " " " " " " "	0	4	0
10 lb. 50 " " " " " " " " " " " " " " " "	0	5	0
20 lb. 100 " " " " " " " " " " " " " " " "	0	10	0
30 lb. 150 " " " " " " " " " " " " " " " "	0	15	0
40 lb. 200 " " " " " " " " " " " " " " " "	1	0	0
50 lb. 250 " " " " " " " " " " " " " " " "	1	3	6
60 lb. 300 " " " " " " " " " " " " " " " "	1	7	6
80 lb. 400 " " " " " " " " " " " " " " " "	1	17	6
100 lb. 500 " " " " " " " " " " " " " " " "	2	5	0

Should any Flockmaster prefer boiling the Composition, it will be equally effective.

MOST IMPORTANT CERTIFICATE.

From Mr. HERBATH, the celebrated Analytical Chemist:—
Bristol Laboratory, Old Park, January 18th, 1861.

Sir,—I have submitted your Sheep Dipping Composition to analysis, and find that the ingredients are well blended, and the mixture neutral. If it is used according to the directions given, I feel satisfied, that while it effectually destroys vermin, it will not injure the hair roots (or "yolk") in the skin, the fleece, or the carcase. I think it deserves the numerous testimonials published. I am, Sir, yours respectfully,

WILLIAM HERBATH, Sen., F.C.S., &c., &c.,
To Mr. Thomas Bigg Professor of Chemistry.

Leicester House, Great Dover-street, Borough, London.

It would also especially call attention to his SPECIFIC, or LOTION, for the SCAB or SHAB, which will be found a certain remedy for eradicating that loathsome and ruinous disorder in Sheep, and which may be safely used in all climates, and at all seasons of the year, and to all descriptions of sheep, even ewes in lamb. Price FIVE SHILLINGS per gallon—sufficient on an average for thirty Sheep (according to the virulence of the disease); also in wine quart bottles, 1s. 3d. each.

IMPORTANT TESTIMONIAL.

"Scoutlon, near Hingham, Norfolk, April 16th, 1855.

"Dear Sir,—In answer to yours of the 4th inst., which would have been replied to before this had I been at home, I have much pleasure in bearing testimony to the efficacy of your invaluable 'Specific for the cure of Scab in Sheep.' The 600 sheep were all dressed in August last with 84 gallons of the 'Non-poisonous Specific,' that was so highly recommended at the Lincoln Show, and by their own dresser, the best attention being paid to the flock by my shepherd after dressing according to instructions left; but notwithstanding the Scab continued getting worse. Being determined to have the Scab cured if possible, I wrote to you for a supply of your Specific, which I received the following day; and although the weather was most severe in February during the dressing, your SPECIFIC proved itself an invaluable remedy, for in three weeks the Sheep were quite cured; and I am happy to say the young lambs are doing remarkably well at present. In conclusion, I believe it to be the safest and best remedy now in use.

"I remain, dear Sir,

"For JOHN TINGEY, Esq.,

"To Mr. Thomas Bigg."

"R. RENNEY.

"B" Flockmasters would be well to beware of such preparations as "Non-poisonous Compositions;" it is only necessary to appeal to their good common sense and judgment to be thoroughly convinced that no "Non-poisonous" article can poison or destroy insect vermin, particularly such as the Tick, Lice, and Scab Parasites—creatures so tenacious of life. Such advertised preparations must be wholly useless, or they are not what they are represented to be.

DIPPING APPARATUS.....£14, £5, £4, & £3.

THE ROYAL FARMERS' INSURANCE COMPANY,

3, NORFOLK STREET, STRAND, LONDON, W.C.

CAPITAL.—Persons insured by this Company have the security of an extensive and wealthy proprietary as well as an ample Capital always applicable to the payment of claims without delay.

LIFE DEPARTMENT.—BONUS.—Insurers of the participating class will be entitled to four-fifths of the profits.

ASSIGNMENTS.—The Company grant Policies payable to the Registered Holders, whereby much expense and inconvenience are prevented. Stamp Duty paid by the Office.

FIRE DEPARTMENT,—

1st Class—Not Hazardous	1s. 6d. per Cent.
2nd Class—Hazardous	2s. 6d. "
3rd Class—Doubly Hazardous	4s. 6d. "

BUILDINGS and MERCANTILE Property of every description in Public or Private Warehouses.—Distillers, Steam Engines, Goods in Boats or Canals, Ships in Port or Harbour, &c. &c., are Insured in this Office at moderate rates.

SPECIAL RISKS.—At such rates as may be considered reasonable.

FARMING STOCK.—5s. per cent., with liberty to use a Steam Threshing Machine without extra charge. Nearly FIVE MILLIONS Insured in this Office.

SEVEN YEARS' INSURANCES may be effected on payment of Six Years' Premium only.

LIGHTNING and GAS.—Losses by Fire occasioned by Lightning, and Losses by Explosion of Gas when used for Lighting Buildings will be allowed for.

RENT.—The Loss on Rent while Buildings remain untenanted through fire may be provided against.

HAIL DEPARTMENT.—(CROPS AND GLASS.)

Policies to protect parties from Loss by the destruction of Growing Crops or Glass, by Hail, are granted on moderate Terms.

LOSSES.—Prompt and liberal settlement.

A G E N T S W A N T E D.

PLATE I.

BORDERER; A PRIZE HUNTER.

THE PROPERTY OF MR. HARVEY BAYLY.

Borderer, a chestnut horse standing sixteen hands high, was bred by Mr. Hudsmith at Brampton in Cumberland, in 1866; and is by Clansin, an out of a Galaor mare.

Borderer was picked up early in life by Mr. John Booth, of Killerby, who took the colt into the show-ring as a two-year-old in 1868, when he won the first prize at Bedale and the second at Richmond—of course in hunting classes.

In 1869, when a three-year-old, Borderer took first prize at the Darlington show, first at the Hexham meeting of the Northumberland Agricultural Society, first at the Cleveland Society's meeting at Middlesborough, second at Richmond, and second at Scarborough—as a three-year-old hunting gelding.

In 1870 Borderer was put second at Islington in the four-year-old class, when he was purchased by Mr. Harvey Bayly, as whose property he took a first prize at the Wakefield meeting of the Yorkshire Agricultural Society.

In 1871, as a five-year-old, Borderer took second

prize at the Wolverhampton meeting of the Royal Agricultural Society of England, second prize at the York meeting of the Yorkshire Agricultural Society, first prize at Birmingham, first prize at Liverpool, and first prize at Southwell.

Borderer also took some premiums as a foal and a yearling when shown by his breeder about home, in Cumberland.

Mr. Bayly tells us he cannot speak too highly of his horse's "manners" as a hunter—temperate, sensible, very stout, and a good goer. Mr. Harvey Bayly, "well known in Bedfordshire," is now hunting the Rufford country in Nottinghamshire, where for his own riding he is set up, amongst others, with two famous show-horses, Borderer and Banner-bearer, who between them won in 1871 no less than £411 10s. in prize-money. Our own reports, month for month past, will best speak to the character of these crack nags, both by the way from the experienced hands of another M.F.H., Mr. John Booth, of the Bedale.

PLATE II.

AT HOME OR ABROAD?

And Master Crafty himself would scarcely seem able to answer the query, as, no doubt, when *impletur veteris Bacchi pinquisite ferinae*—that is, when well primed with 'baeca, old beer, and fat bacon—he has stopped many a good fox *in* before now. The terriers have clearly been very busy, and the mongrel hound proclaims him at home—so far as this may be trusted—at the top of his voice. But those "crafty earth-stoppers," like

OLD SERIES.]

sub-editors and journeymen bakers, lead a hard life of it, though so long as the world gets its morning paper and hot rolls by breakfast-time, with a flying fox well found afterwards, what cares it whether its "fellow-creatures" ever go to bed or not? So we will not be too captious, and if Reynard should be abroad there looks to be a bit of nice open country before him when he sees the oak sported at home.

[Vol. LXXI.—No. 1

THE FARMERS' CLUB.

BREEDING—FACTS AND PRINCIPLES.

The last meeting before the Christmas recess, was held on Monday evening, December 4th, at the Club House, Salisbury-square, Mr. J. B. Spearing, presiding. The subject fixed for discussion, was, "Breeding—Facts and Principles," to be introduced by Mr. J. K. Fowler, of Prebendal Farm, Aylesbury.

The CHAIRMAN in opening the proceedings, said the subject for that evening's discussion was one of the greatest importance, and upon it, he might safely say, the whole success of stock-breeding depended. If there were any mistake as regards the observance of proper principles, stock-breeding generally ended in failure. He would not, however, make any remarks, but at once introduce Mr. Fowler, who was well known to them all, and who would be sure to introduce the subject in such an able and practical manner as to do full justice to it (cheers).

Mr. J. K. FOWLER said: Some years ago my friend Mr. James Howard, M.P. for Bedford, and late chairman of this Club, called my attention to a paper read by the late Mr. Reginald Orton, at the Newcastle Farmers' Club, on the "Physiology of Breeding," and he sent me a copy for perusal. It made a great impression on me at the time, and having many advantages of testing several of Mr. Orton's propositions, I commenced some experiments, and began to examine the truth of his premises, and have found them in the main correct. The principal proposition was, that "the male gives the external organs, the skin, the muscle, and the bones—and the female the internal organs, which are the whole circulatory, respiratory, and digestive organs. The male in fact giving the locomotive powers, the female the vital organs." Mr. Orton gives credit to Mr. Walker for first enunciating this theory as far back as 1841, and which is published in Stephen's "Book of the Farm." Mr. Howard suggested to me when the committee was selecting subjects for discussion for the present year, that this subject should be taken up, as one of great interest to the Club, and also to the public generally, and I hope my humble efforts will be the means of drawing special attention to the subject. The paramount importance of providing food for the people, especially an adequate supply of "animal food," is a serious problem to be solved, and anything which can increase, not only the number of animals, but their size and quality, must be read and studied by every agriculturist in the kingdom; if, therefore, some broad principles for our guidance can be established, it will make cattle breeding more certain in its results, and render that which is now treated almost as a matter of chance, a comparative certainty. I would say "What to breed, feed, and avoid," should be our standing motto—and as my paper is on "Breeding—facts and principles," I will begin by stating such facts as have come to my own knowledge, and such as have been communicated to me by some of the most eminent breeders and others in England, and then state what principles I think would be desirable for perpetuating the best animals in general use as agricultural stock. Mr. Orton, in his most able paper read at Newcastle-on-Tyne, commences by stating the following facts with regard to the Mule; and as this is so plain and so easy of comprehension, I adduce it here, that you may be able at once to comprehend the broad proposition with which I started. He says, you are doubtless aware, that if the male ass is put to a mare, the produce is a mule, and the produce is essentially a modified ass—the ears are long, the mane erect, the tail thin, the legs slender, the hoofs high and contracted, in fact, clearly taking after the male animal. But few are perhaps aware that when a stallion is put to the ass, the produce is called a Hinny, and this is essentially a modified horse, the ears are short, but somewhat longer than a horse, the tail bushy, the skin finer, the legs longer, and the hoofs flat like the horse. You will see, therefore, how closely the progeny in appearance follows the male. But now comes a very noticeable peculiarity, the body and barrel of the first-named, the mule, are round and full, which

resembles the mare, and those of the hinny are flat and narrow, like the ass; but the vital or internal organs of the mare being so much larger than the ass, require a larger cavity or barrel to carry them, and so the bones are moulded to fit the organs, not the organs to fit the bones, so also the smaller vital organs of the ass require but a smaller and flatter cavity, and so also the bones are moulded to fit them. Many of you have perhaps heard of Lord Morton's curious experiment with the Quagga; he put a Quagga stallion to a thorough-bred chesnut mare, and the produce was a quagga mule, with stripes, and many characteristics of the male. The next season he put the mare to a black Arab horse, and to the astonishment of his lordship, she produced a foal bearing strong marks of the quagga, and this effect was visible for three generations from a blood stallion. There is a similar case recorded in the transactions of the Royal Society, where a mare of Sir George Ousley's was put to a Zebra, and the produce was striped like the sire; and she was next year served by a blood horse, and the foal had the zebra stripes, and the same result again followed the next year. It therefore would appear that a female once impregnated retains certain traces of the male, which remains by her for an undefined period. Now I have taken some pains to follow this out, and in the Zoological Gardens, from that most intelligent curator, Mr. Bartlett, I find this in the main correct. He showed me a white Spanish ass, with a few dark spots on him, and he had all the outward characteristics of our male ass in this country, except as to colour; and they have put him to several ponies, and in every case the produce was a modified ass; but he seemed to have exercised but small influence as to colour. There is one very amusing fact with this asinine gentleman—that since he has had pony mares he will have nothing whatever to do with his own tribe. Mr. Bartlett says they have tried mares with the male zebra in the establishment, and he is so ferocious and savage that he has nearly killed them, and they have ceased to try them. It is said, and I believe truly, that mules do not breed; but it may not be generally known that male and female mules have sexual intercourse, and Mr. Bartlett, however, thinks some day he shall find they will breed. I have seen some extraordinary instances of external appearances, especially of the locomotive powers following the male, and will give you one of my own experience. I once rode a very good hunting mare got by a thorough-bred horse named Maple. He had a sort of club fore-foot, and was lame with it; my mare had upright coronets of the fore feet more like donkeys, and she eventually went lame with them. Some years afterwards I saw a chesnut mare with a foal by her side going to Baron Rothschild's horse Hungerford. She was very lame, swinging her off fore-leg. I found she had a large bumble-foot, and on inquiry heard she was got by Maple. I have since made inquiries, and discovered that most of his progeny had peculiarly formed upright fore-feet, and many went lame there. I also remember a very good stallion called Uncommon. I believe he was own brother to Jericho, belonging to Lord Lonsdale, and who covered in our neighbourhood. He had a peculiar action of dishing or swinging his off fore-foot outwards when going fast, either trotting or galloping, and nearly all his descendants, whatever mares were sent to him, did the same. It was well known to all our neighbourhood, who used to say, if they saw one of his stock along the road, "Here comes an 'Uncommon.'" Mr. Finlay Dun wrote one of the most interesting and able papers I ever perused on "Breeding," which he read at the Midland Farmers' Club last year. Mr. Dun, in that lucid and forcible style for which he is so noted, goes very fully into all these questions, and—I shall have several times to quote him—says, that "not only do the parents transmit to their offspring their own external configuration, they also mould the various internal organs, and implant the particular habits and temperaments; all are equally

transmissible." He then goes on to state, with regard to horses, how persistently does the blaze on the face, or white legs, reappear in each generation. He mentions a case of a celebrated cart stallion in Leicestershire, where three-fourths of his stock have white leg markings, and that in one of the best horse-breeding counties in England. "There is at the present time a yellow bay cart-horse, which has been repeatedly made up for showing, has gained various county premiums, and has thus acquired a local celebrity in spite of his narrow chest, his weak loins, and his round, rough, greasy legs. For several years this brute has procreated a large number of faulty foals; many are produced with deformed heads and crooked spines. From false presentations, many mares put to him die; some of his colts, when dropped, are unable to stale or dung, and oftentimes their urachus is imperfectly closed. Those that survive for a few weeks frequently have scrofulous abscesses about the joints. More than one-third of his foals die before they are six months old, the residue are rickety, delicate, ill-thriven, and will not pay for rearing." These are the forcible remarks of Mr. Finlay Dun, and I am sure many of my hearers can assert pretty much the same of many stallions in their locality. But do not let us give the whole discredit to the stallion. Look at the wretched mares that are constantly put to the horses travelling the country. Any broken down weed, or lame old cart mare, is deemed in many cases good enough to breed from; and one of the most fertile sources of badly-bred horses is to be found in the mistaken kindness of many landowners and gentry in a neighbourhood who keep horses for the use of their tenantry, free of cost. Let them by all means keep horses for use, but by making a charge for the mares, I feel sure there would be fewer useless brutes sent to them to continue the flood of unsound animals that are generally to be found in the country. This brings me to the breeding of horned stock, and here my subject opens out so widely that I fear I must somewhat trespass on your patience, and ask you to bear with me whilst I again call your attention to my first proposition as to the influence of the male. The great and distinguished lines of blood—the Bates, the Booth, and the Knightleys—having each their followers, sometimes in their distinctive purity, sometimes in their judicious crossings, are each and all striving to attain perfection; and in that noble rivalry, I cannot call it a *bloodless* one, are all doing great service to the nation in their efforts to improve the meat-producing animals, not only of England and her colonies, but the world, for all come here for blood; whilst the colonies, hoping to add to their own pecuniary resources, are helping to swell the wealth of the nation. It is certainly remarkable to observe the external peculiarities of each of these tribes, and the initiated and those most interested well know the noble carriage and grandeur of outline of the Bates tribe; the heavily-fleshed, rich-haired character of the Booths and the lovely sweetness of countenance, the fine shoulders, and deep milking peculiarities of the Knightleys. There are many instances recorded as to home stock, in which the influence of the male was felt through many generations. That of the bull Hubback (319) for instance, and also of Favourite (252), whose peculiarities of quality and style are found to the present day. In our own times let us take Earl of Dublin (10178); the late Mr. J. C. Adkins, of Milcote, used him in his noted herd, where he did great service, and then sold him to Sir C. Knightley, where he did even more distinguished service than in Mr. Adkins' herd. Here was an extraordinary instance of his impressing deep in-milking qualities on his stock, which was an *internal* organization; but on looking to his pedigree you will find he was descended over and over again from the renowned milker Princess through almost every sire and dam in his pedigree, who were all noted milkers. And again, being used on a herd of noted milking qualities like the Knightley, it was not to be wondered at that his stock to this day are amongst the most prolific and deepest milkers we have. In reference to this point I will quote Mr. Darwin, who in vol. 2 of "Animals and Plants under Domestication," chapter 12—on "Inheritance"—says: "What can be more wonderful than that same triling peculiarity, not primordially attached to the species, should be transmitted through the male and female sexual cells, which are so minute as not to be visible to the naked eye, and afterwards through the incessant changes of a long course of development, undergone either in the

womb or in the egg, and ultimately appear in the offspring when mature, or even when quite old, as in the case of certain diseases? or again, what can be more wonderful than the well ascertained fact that the minute ovule of a good milking cow will produce a male, from whom a cell, in union with an ovule, will produce a female, and she, when mature, will have large mammary glands, yielding an abundant supply of milk, and even milk of a particular quality? Nevertheless, the real subject of surprise is, as Sir H. Holland has well remarked, not that a character should be inherited, but that *any should even fail of being inherited.*" 7th Duke of York (17754) also has left his mark unmistakably in the case of every cow he touched; and whether it was a pure Duchess, a Florentia, an Ursula, a Gazelle, or any others of the various tribes put to him, the progeny of one and all, in external appearances, were improved by him. The same thing I am told was the case with Prince Alfred, Commander-in-Chief (21451), and some others of the noted herds of Booth fame. On my visit to those extraordinary sales, conducted by our old friend Mr. Strafford, in the north of England last September, when at Mr. J. P. Foster's, at Killhow, in Cumberland, I was much struck with the beauty of all the young stock—their grand style, fine touch, and rich hair and colour, and on reference to my catalogue, I found they were all by his bull Duke of Oxford 17th (25994); it did not matter on what he was used, the progeny were all improved, strains of blood the most opposite, and oftentimes fully mixed, yet all were good. When also at Colonel Gunter's, at Wetherly, some two years ago, the impress of Fourth Duke of Thorndale was remarkable. But this opens up a very abstruse and interesting branch of the question—that of "*Prepotency*," or the overpowering influence of one or other of the sexes. Mr. Finlay Dun says it is mostly developed in the males, "and amongst horses, some of the best thorough-bred families are remarkably prepotent." Everyone conversant with racing stock must admit the prepotency of Eclipse, and of Stockwell, and I would add King Tom. Shorthorns, amongst cattle tribes, are notably prepotent, and crossed with Herefords, or Longhorns, speedily wipe out, as it were, their specialities. Favourite, Duke of Northumberland, Duke of Gloucester, Seventh Duke of York, and Earl of Dublin, are examples of Shorthorn sires, which, judged by the uniform character of their progeny, possessed unusual prepotent powers. The ass is stated to be prepotent over the horse, and the jackal over the dog, and the best of the Down sheep appear superior in prepotency to the white-faced sorts." I myself used a bull, Hardicanute (26638), bred by the late Mr. J. C. Adkins, who was particularly prepotent. Seraphinas and Knightleys were all fully impressed by him, and his fine touch and quality were perceptible in all. Mr. Thos. Booth, of renowned Warblay fame, writes to me, that "there can be no doubt, as a rule, that the male exerts a preponderating influence as far as the general formation of the animal goes, and this may be traced through many generations: hence the value of pure blood, from whatever strain, for wherever a bull has been introduced into a herd, or a pedigree, and has left an inferior mark on his stock, that pedigree has been depreciated in value at future sales. There can also be no doubt that the founders of the breed of Shorthorns improved their stock in a great measure by the selection of sires; and as some sires became more and more closely connected by in-and-in breeding, so they were more and more certain of like begetting like. I am certain that with many breeders of the present day all principles of selection on account of form and character are lost sight of and made to give way to pedigree only. This may ultimately prove injurious to Shorthorns by losing what our forefathers tried to effect, viz., to produce the greatest quantity of good meat with the least of offal." After some other observations, Mr. Booth says, "You will gather from these few remarks that I am strongly impressed with the necessity of having a *first-rate sire*—I don't altogether mean a *price* animal—for the improvement of a herd, because I know that such a sire will almost invariably leave his mark, and certain points may at times be traced back for three or four generations." These remarks, coming from so distinguished an authority, add great weight to the broad proposition I set out with. There is a very remarkable instance of impress by the theory of natural selection in the case of the noted wild cattle in Chillingham

Park, which was communicated to me by Mr. Jacob Wilson. He says that "at present the herd numbers sixty-seven head, and that the herd has been kept up by *in-and-in* breeding for several centuries—of course, the master bull always serving the cows." You will see here that the strongest male continually asserting his prowess keeps up the vigour of the herd, and when another stronger animal rises up amongst them, he in his turn becomes "Lord Paramount," and, as old age comes on, gives way again to his successor. In the *St. James' Magazine* lately was an account given by a lady of a battle for the mastery of the bulls, which, from the cleverness of its description, I cannot forbear giving: "There is always danger in meeting a *sulky* bull, that is, a bull banished from the herd, and literally sent to *Coventry*. The way this is affected is that the younger bull, after walking round the herd, stands ready to meet any comer. Then the elder bull, stepping forth from his harem, answers the challenge, and advancing step by step, the rivals meet, and the battle rages furious and strong, the herd standing by variously excited. One or two bulls, apparently acting as self-constituted umpires, are watching with heaving flanks and foam-stained lips the chances of war. Thus the fight goes on, amidst growls of rage, clouds of turf and dust, and the sudden heavy crash as the thick foreheads meet. Presently one of the combatants falters, then the fight is decided; for upon the first symptoms of weakness the umpire, rushing in, bears down upon the faltering bull, and completing the work with his fresh strength literally bowls him over. As the vanquished struggles to his feet, blinded by blood and crippled by furious blows, the herd comes upon him, and overwhelmed by numbers he is driven forth disgraced, discarded and beaten, to hide in the forest and brae-ens, until his wounds being healed he comes forth to seek revenge in another combat." But perhaps the most extraordinary instance of the influence of the male as to externals is to be found in a trial of my own with the Bramah and Dorking fowls. After reading Mr. Orton's paper, in which he recorded his trials with the Cochin and Dorking, I began with the Bramah and Dorking. The uninitiated of my listeners must understand that the Bramah has four claws only, has feathered legs, lays a buff-coloured egg, and the cock crows or roars like the Cochin; and that the Dorking has five claws on each foot, has no feathers on its legs, lays a white egg; and the cocks crow with the old English shrill clarion note. I put a Bramah cock to some Dorking hens, and the chickens almost invariably had four claws on each foot, in some instances five on one and four on another, and the pullets from these laid white eggs, and, most remarkable of all, the cockerels crowed like the Dorking, but they had small combs and had all the external appearance of the Bramah. Now, in putting the Dorking cock to the Bramah hens it was reversed in an extraordinary degree, for nearly all the chickens had five claws and the pullets laid buff eggs, in all these instances showing unmistakably that the externals followed the male, and that the internal organization, *i.e.* egg laying and the crowing, which was from the internal organisation of the throat, followed the female. A most singular case also occurred about four years ago. Amongst my Aylesbury ducks a Rouen drake got mixed with them for only one night, and one of the white Aylesburies subsequently produced one or two coloured ducklings; she was, therefore, carefully put away, but as she was one of my best and purest strains, she was bred from the next year, and she every now and then threw out a duckling with partially brown plumage. The next year she was tried again, and although for two years she had never been near a Rouen drake, she continued to breed an occasional duckling with a few discoloured feathers: here was one of those strange occurrences which we shall have to consider more deeply before we close the subject. The Rev. Mr. Smythies told me that he bred a chicken from a game hen by a Dorking cock, and that one leg had five claws and was white in colour, and the other leg was yellow and had but four claws; this was a strange combination. In speaking of turkeys, perhaps it is not generally known that one fecundation by the cock bird is sufficient to fertilise all the ovary of the hen. I have myself had a hen turkey sent away to a neighbouring farm to a cock bird, and she has never been near one again, and yet every egg was fertile; and, still more remarkable, after bringing up the brood, she laid again, and although never having been to the male bird since the first time, the new laying of eggs was also fertile; here we have a remarkable instance of the impress

of the male beyond one generation; many such can be adduced; and Darwin, through repeated trials with pigeons, shows the same results. There are, however, many singular cases where the influence of the female has been prepotent even in externals, or where she has exercised extraordinary influence, through either the imagination or some other cause inexplicable. Mr. Savidge, of Oxfordshire, whose veracity is unimpeachable, tells me that on one occasion when he lived with the late Mr. Langston, of Sarsden, that a neighbour sent a pure Shorthorn heifer to one of their purely-bred bulls, and as she was difficult to drive they sent an Alderney cow to accompany her, and he (Mr. Savidge) remonstrated with the man for doing it, and said the heifer would be sure to have an Alderney-coloured calf. She was served by the bull, and the produce was to all intents like an Alderney both in colour of nose and general appearance. I have the following from the same gentleman. The late Lord Ducie, who was particularly noted for his breed of pure white pigs, as was also Mr. Langston, gave Mr. Langston, a very celebrated white boar who had gotten some of his lordships best pigs, Mr. Langston put him to his best white sows, and they produced him some first class white pigs, but Mr. Langston in his kindness permitted his tenants and cottagers to send sows to this boar, many of which were Berkshires and other black sorts. From that time he began to get black and spotted pigs from the pure bred white sows to which he had been previously put. Now here was a case of imagination on the part of the male, if such a thing could happen. I have also an interesting letter from Mr. Smith, of Henley in Arden, one of our most celebrated Berkshire breeders, who says: "I always notice that the male transmits the greatest external influence to the young ones, but very seldom continued beyond the second generation, in colour. When I first began breeding, sixteen years ago, I used to let my neighbours send sows to my Berkshire boars, and many instances occurred where the produce have been all the colour of the boars, good-looking Berkshires. For the last ten years I have never let any sows but my own pure Berkshires be served by my boars. I have always found the influence of the female in the internal organisation very great as to transmission of fecundity, milking powers, and constitution, to all her offspring." He then states the following fact: "Some years ago I had a very favourite sow that had bred me six farrows of pigs, and most of them had taken prizes; she then refused to breed after being sent to every Berkshire boar I could send her to. I then put her to her own son. The produce were half cripples, the hind feet being in the place of the fore ones. She afterwards bred me six more farrows, the last one of twelve pigs, the best she ever bred." And Mr. E. Duckering, of Kirton Lindsey, the noted breeder of white pigs, writes to me thus: "I have even found symmetry depends much on the male animal; I would, therefore, have him of as perfect form as possible, displaying all the points of his race;" and he also states that occasionally neighbours send a Berkshire sow to his white boars, and "the produce has invariably been all white." I have also an interesting letter from the Rev. Mr. Storer, of Hellidon, of Shorthorn notoriety he considers that the broad proposition with which I started is the Scotch verdict "Not proven;" but that "external peculiarities are often transmitted by the male through many successive generations; and where not strictly transmitted, they have reappeared after remaining in abeyance; but my experience does not lead me to think such power of external peculiarities is confined to the male animal. I conceive that all depends upon which of the two is more 'prepotent.' "As an example," he says, "I saw a few years since at a farmers in Notts, a Shorthorn roan heifer with a large black spot on the thigh, and corresponding with a black bar across the tail, and was informed that she was descended from a cow of Mr. Burgess's, six generations back, which cow had an exactly similar blemish." This was a case of reversion or atavism. With regard to colour "in many cases," he says "the calf is more likely to derive its colour from one or other of its grand parents, than from either of its parents." Mr. Duckham, of Herefordshire, in speaking of that grand tribe of cattle for which his country is so famed, says: "I think the male animal has great external influence upon his offspring, both in character and general outline. The use of a bull with horns of an upward tendency, or what are called 'Cock horned,' will display itself in the offspring for many generations, and is difficult to eradicate, and so with a hard skin and coarse wirey hair." With

regard to colour, a polled Angus has been tried with the Herefords, and every calf had a white face, and white marks upon the underside of the body. Mr. Charles Howard, of Biddenham, also expresses his entire concurrence in the theory and remarks upon the influence of the female as to milk: "You have only to go to that strain of blood which you patronize so strongly, viz., Sir Charles Knightley, for confirmation." As to colour, the influence of the male was felt in a remarkable degree in the Bates and Booth bull, May Duke (18320). He got some of the worst colours I ever saw. I think the same principle as to the influence of the male holds with sheep. With regard to sheep, it is well known how a ram influences the external characteristics of a flock. The Oxfordshire Downs, which now rank as an established breed, were produced about the year 1830 by crossing Hampshire or South-down ewes with the Cotswold ram; and despite the assertion to the contrary, I know the greatest difficulty is experienced in keeping up the leading characteristics of the breed. Here we find the male leaving behind in his progeny size and wonderful external appearance; and thickness of lean and closeness of grain of meat, being an internal production, following the female. As an instance of remarkable careful selection, and thus keeping a breed of sheep pure, nothing can surpass the late Mr. Valentine Barford's flock. Here, for nearly fifty years, he never bought a ram, but selected the best of the best every year, and produced a flock which for evenness of character and perfection of shape has, perhaps, never been surpassed. Another eminent example of this practice was the late Mr. Jonas Webb with his Southdowns. Darwin mentions the case of the Ancon sheep as a very curious instance. He says they were first reared in Massachusetts, a ram having been accidentally born with short crooked legs and a long back. It was soon multiplied, and raised into a new stock, known by the name of the "Ancon breed." We therefore see from the number of facts which have been produced that the proposition I first laid down, that the male chiefly exercises the external and the female the internal organization, is in the main correct. If I choose to carry on this paper farther I should tire your patience, and could say no more than I have already said. We have seen how the principal acts with the horse and the ass, in horned stock, with sheep and pigs, and also in numberless cases of poultry. I admit there are many weak points in my armour, and which will probably be found out by the practical and scientific men I see around me. But let us see if we cannot apply these facts, and try and form principles to guide us in our attempts to improve the live stock of this country. In our horses let us look well to the stallion—that he has good carriage, fine action, speed, and good colour; that our mares have strong constitution, free from all constitutional blemishes, strong in wind, and great power of endurance—above all, good tempers. With our sheep—that our tups shall have strong limbs, thick serags, broad loins, good length, and good heads and ears. That the ewes have good fleeces, whichever we go in for (Long, Short, or Lustre wool); broad chests, showing strong internal structure, good milking qualities, and disinclination to roam about in our southern districts, and good foraging powers on hill and mountain sides. That our boars should be powerful, with good hair, and plenty of it; short headed, and good loins; bodies straight and long, with short legs, and fine bone. Our sows quiet, feminine looking, great motherly instinct, great fecundity, with full milking powers, and great aptitude to fatten. That our bulls should be of noble bearing, with grand masculine heads: fine crests, well covered with good hair; fine carriage, strong hind legs, good girth, well sprung ribs, and strong loins. The cows quiet, lazy, good-tempered creatures, with deep bosoms, great milkers (the most essential of all), lovely sweet heads—well expressed as Knightley. These would be general characteristics, but we must be careful of external associations. I feel sure that a herd of valuable Shorthorns ought never to have a Polled Scot, an Alderney, or any but their own breed with them, and if we are to believe the statements we have heard, even the external surroundings must be attended to. Mr. McCombie, I am assured, has all his buildings, his gates, gateways, and everything about his farm black, so that no imagination shall disturb his black Polled Scots. I have heard that a certain lady, of well-deserved and well-known Shorthorn fame, had wondered at the preponderance of white calves which was bred in her establishment, and that the roans year by year were getting lighter; and it was suggested

that her annual practice of line and white-washing her buildings should be discontinued. She did so, and very soon her ladyship's cows had fewer white calves, and the roans got darker. Whether it be imagination or not I will not pretend to say; but I state the facts, and out of them perhaps the principles may be determined. We have also seen how "prepotent" some animals are over others, and I am almost inclined to think with Mr. Storer that oftentimes the female, when very vigorous, is prepotent over the male even in externals; but this has been probably inherited in former generations from the male. I have studiously avoided alluding to the human race; but I cannot forbear mentioning as an illustration the well-known fact that the long upper lip of the imperial house of Austria was said to have been inherited from the marriage of the Emperor Maximilian with Mary of Burgundy; and in a well-known dual house of this country the prominent, finely arched nose has been inherited for several centuries both through the male and the female lines. There is one other circumstance that ought to receive consideration—that is, the influence of food and climate in modifying species. The Rev. Mr. Titcombe, in the reports of the Victoria Institute, says, in speaking of the origin of the negro that "the action of food and climate exercises great influence in modifying size, colour, and even structure. In food it is well known, that hemp-seed given to birds of the finch tribe, will turn them black. Rich and plentiful food, when given to young swine, directly tends to make their heads broader and shorter, whereas poor food works a contrary result; horses fed on fat marshy grounds, grow to a large size; while on strong soils or dry heaths, they remain small." And I therefore think if a man leaves the district to which he has been accustomed, and takes a farm in another county, he should fully study the class of animals bred in that district, before he brings away with him his own pre-conceived ideas. Generally speaking, the breeds which have become indigenous to a district are generally the most suitable. There are, of course, some notable exceptions. I believe the Shorthorns will adapt themselves to every part of the three kingdoms, and have proved themselves capable of living in almost every climate in the world. The Berkshire pig too seems to thrive anywhere. The Leicester sheep fails in many localities; and the Sussex Downs in many districts of England are comparative failures, and I believe the Suffolk horses flourish nowhere but in the Eastern Counties. There are also many parts of England where the Dorking fowl cannot be reared to advantage, and there is no doubt that the early maturity and delicacy of colour of the Aylesbury duck rapidly deteriorates when removed from the neighbourhood of Aylesbury. My subject has such a tendency to branch off into so many lines, that I must bring my remarks speedily to a close. But do not let it be imagined that I have here shown how easily breeding a good class of animals is. Successful breeding requires the greatest possible care, skill, and attention, and to obtain marked success, every minutie must be attended to. Darwin says, p. 3, Vol. II: "Some writers, who have not attended to natural history, have attempted to show that the force of inheritance has been much exaggerated. The breeders of animals would smile at such simplicity; and if they condescend to make any answer, might ask what would be the chance of winning a prize if two inferior animals were paired together? They might ask whether the half wild Arabs, were led by theoretical notions to keep pedigrees of their horses. Why have pedigrees been scrupulously kept and published of blood-horses, of Shorthorn cattle, and more recently of the Hereford breed? Is it an illusion that these recently improved animals safely transmitted their excellent qualities even when crossed with other breeds? have the Shorthorns without good reason been purchased at immense prices, and exported to every quarter of the world, a thousand guineas having been given for a bull? With greyhounds, pedigrees have been kept for generations; and the names of such dogs as Snowball, Major, &c., are as well known to coursers as those of Eclipse or Herod on the turf. Even with the gamecock pedigrees of famous strains were formerly kept, and extended back for a century. With pigs, the Yorkshire and Cumberland breeders prepare and print pedigrees; and to show how such highly-bred animals are valued, I may mention that Mr. Brown, who won all the first prizes for small breeds at Birmingham in 1850—sold a young sow and boar of his breed to Lord Ducie, for 43

guineas; the sow alone was afterwards sold to the Rev. F. Thursby for 63 guineas; who writes, 'she paid me very well, having sold her produce for £300, and showing now four breeding sows from her.' Hard cash paid down over and over again is an excellent test of inherited superiority. In fact the whole science and art of breeding, from which such great results have been attained during the present century, depends on the inheritance of each little detail of structure. But inheritance is not certain, for if it were, the breeder's art would be reduced to a certainty, and there would be no scope left for all that skill and perseverance shown by the men who have left an enduring monument of their success in the present state of our domesticated animals." Before I conclude I must say one word as to crossing. I have always observed a tendency to revert to one or both parents, which is very strong, and endures for many generations. In "Youatt on the Pig," Mr. Lindsay states that in a litter of Essex pigs two young ones appeared which were the image of the Berkshire boar that had been used twenty-eight years before in giving size and constitution to the breed; and Mr. Darwin also says that he observed, in a farm-yard at Betley Hall, some fowls showing a strong likeness to the Malay breed, and was told by Mr. Tollet that he had forty years before crossed his birds with Malays, and that he had often tried to get rid of this strain, but gave it up in despair, as the Malay character would reappear. I have now tired myself, and perhaps exhausted your patience, and trust that these disjointed opinions may open up an enlarged view of the subject, and that in the next two or three years some more able writer will be enabled to lay before the country a statement of results showing that this paper has not been written in vain, and that the discussion of this evening may stimulate the farmers of England, and the nobility and gentry who are amongst our most distinguished leaders in this most seductive art, to make experiments, for enlarged exertions to provide food for our ever increasing population; and whilst I have given you the opinions of many of our leading farmers on this subject, and see around me so many of them distinguished by their zeal and success in the cause, let us not forget that not only we, but many of the highest in the land, are our competitors, and from the liberal, yet judicious and useful way in which they spend their money for breeding purposes, we may one and all congratulate ourselves that they are fully alive to the importance of this subject.

MR. G. SMYTHIES (Marlow Lodge, Leintwardine) said Mr. Fowler in his admirable paper, speaking of the kind of animals which they should breed, had said more about form than anything else. As a breeder, he wished to say a word in favour of quality. What he meant by quality was an animal that would live in good condition on poor land, and lay on a large amount of flesh in proportion to its frame. He could easily believe that that would not be likely to enter into Mr. Fowler's head. On that gentleman's land quality seemed to be of no great importance, for he told them that the ducks which he produced got small when they went anywhere else (laughter). He (Mr. Smythies) came from a district where the grass was of middling quality, and unless they had animals of the class to which he alluded they could not breed at a profit. Let him illustrate what he meant by referring to last year's Smithfield Show. He did not say one word in disparagement of Shorthorns, when he expressed his belief that Herefords would live on poorer land than Shorthorns, that they did not ordinarily require as good grass, and could live on inferior land. There were three classes of bullocks exhibited; there were three prizes in each class; there were altogether nine animals that obtained prizes. Well, the nine prize animals among the Shorthorns did not weigh as much as the nine prize ones among the Herefords, and he said that was due to difference of quality. Although the Herefords would live on poor land they laid on a vast amount of flesh. The case was similar with regard to sheep. If there were any proud Salopians there who despised the crossing of their sheep with Southdowns, he would refer them to the magnificent pen of Lord Walsingham, which, though of small frame and capable of living on poor land, were heavier than any pen of Shropshires of the same age. He hoped his friends from Shropshire would bear that fact in mind. He knew there were many excellent breeders in Shropshire who did not admit that crossing with Southdowns was at all beneficial. He contended, however, that it would give quality, which was what

was wanted. He would impress upon every breeder that they must not depend altogether on frame, but must look to that quality which would lay on a great amount of flesh with a comparatively small amount of frame (Hear, hear).

MR. B. E. WARD (Drayton, Rockingham) said, although he was very much pleased with Mr. Fowler's paper as a whole, he could not at all concur in what he said about Leicestershire horses; and he could hardly conceive where he got his information. When he stated that he had bred horses and sold ten yearlings for £37 each, they must, he thought, feel that the thing could not be very unsatisfactory. Neither were they very unsuccessful as regarded sheep. As regarded the crossing of sheep every one must be aware that the second and third crossings were of no use at all; it was only the first crossing that was advantageous. On the whole he thought Leicestershire was not very badly represented either as regarded horses or sheep.

MR. J. HOWARD, M.P., said, seeing many distinguished breeders in that room, he felt that any observations which he might offer would have little weight compared with the expression of their opinions, he had not intended to speak; but as those gentlemen seemed reluctant to rise, he would make one or two remarks; he was quite sure that they all felt much indebted to Mr. Fowler for the pains which he had taken to bring before them in so suitable a manner a subject of such great importance, not only to the farmers of England, but also to the consuming public. If Mr. Fowler had not that evening enunciated any very new principle, his paper would be instrumental in diffusing information which was possessed by the few among the many (Hear, hear). The principles of breeding had been well known for many years to some distinguished breeders; but if they had been more generally diffused, and were more widely known, the many ill-shaped under-bred animals that met their eyes in almost every county of England would never have seen daylight (Hear, hear). Mr. Fowler commenced his paper by laying down the proposition that the male animal ruled the external organization, and that the internal organization came from the female. It was many years now since he first brought under Mr. Fowler's observation that principle; since then he (Mr. Howard) had narrowly observed in every part of the world he had visited the effect of that principle. In horses, in sheep, and in poultry, he had constantly found that the external organization came mainly from the male animal. To begin with horses, he had invariably noticed that in the breeding of both cart horses and blood horses the form took almost exclusively after the male. There were two well-known blood horses, especially known in the district to which Mr. Fowler belonged—Grandboro' and Wingrave, both sons of King Tom. He sent to Grandboro' a well-bred hunting mare, which was "highly commended" at the Royal Show, at Bury; he had a right to expect in the progeny a blood-looking horse; but, contrary to his expectations, the produce turned out a coarse-bred looking animal, although a good one. The next year the mare went to Wingrave; this foal looked like a thorough-bred, and at four years old was sold to a dealer for 200 guineas. These different results are to be accounted for, my Grandboro' being a thick under-bred-looking horse whilst his half-brother Wingrave is a most blood-looking one. Then, again, he had found that the feet came from the horse, and did not follow the mare. Having a mare which had flat feet, he had it put to a horse which had good feet, and the result was that her three foals had good feet. He mentioned this further to corroborate Mr. Fowler's proposition that the external organization came from the male. He had had, as most present were aware, considerable experience in the breeding of pigs, and with them also the same principle held good. With regard to colour, he believed that the male had generally much more to do with fixing the colour of the progeny than the female. Some years ago he went to see the Duke of Bedford's farm, managed at that time by Mr. Baker, whom he saw present; he had a herd of black pigs, upon which a white boar was used, and it was a remarkable fact that the young pigs all came white. Some years ago he (Mr. J. Howard) crossed a Berkshire sow with one of his white boars. The result was that the offspring all came white, and it was not till about the sixth generation that there was any deviation from that rule, when black spots appeared. During the last year, while residing for a time at Brighton, he went to visit Mr. Dumbrell, a well known member of that club, who had a very fine herd of

Alderney cows. On that occasion he saw a red Sussex bull among the herd, and on his noticing the fact, Mr. Dumbrell observed that the calves all came red. He never had an exception. The Alderney was unmistakably a breed purer, and with a longer pedigree than the Sussex, yet this did not suffice to counteract the influence of the male as to colour. With respect to poultry, he could confirm, from his own experience in crossing, Mr. Fowler's statement that the female ruled the colour of the egg laid by the progeny. Mr. McCombie, M.P. for Aberdeenshire, whose high reputation as a breeder of polled cattle was well known to every one, had told him that some years ago he had some red cattle near to his black polled herd, and that his calves from them occasionally came red; that he removed the red cattle, and that from that time a red calf was never dropped. He (Mr. J. Howard) thought that if the observations of large breeders were collected, farmers would be able to arrive at far more definite rules than at present existed in reference to the breeding of cattle, and breeding would not be so much a game of chance. It was well known that like begets like; but there were many failures for want of adequate knowledge in mating, and, in his opinion, if facts were collected and tabulated, that would lead to the establishment of a sound theory, and to great improvements in the practice of breeding.

Mr. T. CONGREVE (Peter Hall, Brinklow, Coventry) said Mr. Fowler had occupied himself chiefly with "principles," but he wished to make one or two observations on "facts." Although the Royal Agricultural Society of England had existed ever since 1835, and although it had held shows throughout the length and breadth of the land, and had offered liberal prizes to encourage the best breeds of animals, yet he was sorry to say the fact remained—he was now speaking as a grazier—that year by year it became more and more difficult to buy a lot of good beasts to graze. He hoped that the discussion of that evening would lead to something like established principles of breeding, so that the breeders might be able to lay out their money on more profitable descriptions of stock. Whether he desired to get Shorthorns, Herefords, Welsh runts, or any other kind of stock, he felt the difficulty to be increasing every year, and that certainly seemed extraordinary, considering the immense amount that was spent in prizes, and the vast amount of discussion that had taken place. Looking back to thirty years ago, he believed that graziers were now in a worse position in that respect than they were at that period. His friend Mr. Smythies, who was a Herefordshire man, would bear with him for saying that the Herefords were getting lighter, more gaudy, less deep in the thigh, less fleshy than they used to be. What graziers wanted was an animal that would carry some butcher's meat about it (laughter).

Mr. L. A. COUSSMAKER (Westwood, Guildford) said, although he had not been a very large breeder, he was fully sensible of the necessity of their all endeavouring to breed such animals as would answer the purpose best. There were different rules and different fashions, predisposing some people to one breed and some to another; but what they should all endeavour to arrive at was the breed of animals that, with good quality, would be most likely to attain early maturity. They would of course have gained a great point if they could secure two-year-olds which would be as forward as inferior breeds were at three years. Whatever the breed might be, it was by trying to get the best quality of animals that they were most likely to attain their object.

Mr. J. TREADWELL (Upper Winchendon, Aylesbury) believed that the reason why Mr. Congreve and other graziers had increased difficulty in getting hold of good beasts to graze, was, that many farmers had discovered that it was most profitable to fatten well-bred animals themselves (Hear, hear). He quite agreed with Mr. Fowler that like begets like. Some years ago he had a common herd of cows; at last he used a good Shorthorn bull, and the first time he did so the produce was influenced by it in a more marked manner than the second cross.

Mr. MECHE thought that increased and increasing deterioration of stock in this country was owing to false economy on the part of farmers. He had seen cases in which, rather than pay an extra half-crown, a farmer had ruined the progeny of a well-bred cow. But the mischief did not end there. The calf was sold, and it was almost impossible to trace the evil to the end. What it was necessary to infuse—and he believed Mr. Fowler's paper would help to infuse

it—was a general belief in the agricultural mind, that it was better to pay a little more at first than be saddled with an inferior kind of animal (Hear, hear). He was a believer in the influence of soil and climate upon race. They all knew perfectly well how those influences operated in the case of the human race. Parents who had families in India were obliged to send them home lest they should deteriorate. He even believed in the influence of soil and climate in this country. He recollected once having thirty Lincolnshire farmers to dine with him, and every one of them was at least 6 feet 2 inches in height (laughter). On the rich lands of Lincolnshire there were big horses, big oxen, big men (laughter), everything, in short, was big; and while he gave the Shorthorns credit for doing well in many places, he contended, that a proper quantity and quality of food must be administered to them. It was with animals generally as it was with the human race. It was a common saying, "Like father like son." If there happened to be a deformity in the father it would sometimes be found in his boys; and, on the other hand, he had known cases in which the children had not the slightest resemblance to the father, the mother having a strongly developed and marked character. He believed that it was quite impossible to take an animal from rich land and place him on poor land without his deteriorating in character.

Mr. H. M. JENKINS (Hanover-square) said there seemed to be on the part of many breeders present a desire to trace out principles with regard to breeding, and Mr. Howard had suggested as one means of accomplishing that object that facts should be tabulated. He hoped that if any gentleman should have enthusiasm enough to begin to tabulate facts he would take care to ascertain what was the relative value of each fact. Mr. Howard spoke of the influence of males, and Mr. Mechi had just led up to the same point. He (Mr. Jenkins) wished to throw out the suggestion that the prepotency of males, as naturalists termed it, was explained to a great extent by the fact that the weakly males were all castrated, and therefore only the strongest and most powerful males were used for the purpose of breeding.

Mr. H. TRETNEWY (Silsoe, Ampthill) said many ingenious theories had been raised with regard to breeding as well as on other subjects; but he questioned very much whether they knew a great deal about it yet. It had been laid down by many authorities that the external organization came from the male, and the temper and constitution generally from the female. That view might to some extent be correct, but he doubted whether it was invariably so. How many of them, for instance, had found mares which had been put to different horses having foals more like themselves than like the sire? and it was frequently found that diseases were propagated at least as much by the mare as by the horse. If they all knew really how to deal with such cases there would be no difficulty in breeding; but the thing seemed to him altogether a mystery. He believed that in some classes of animals the male had greater influence than in others. He thought that a flock of sheep was more influenced by the ram than the breed of horses was influenced by the stallion. Perhaps mares had a greater influence in transmitting their own qualities to their offspring than any other female animals. Having had some experience in the breeding of horses, cattle, and sheep, he had observed that the sympathy of the mare was peculiarly great. He well remembered a case in which a friend of his had an Irish colt with peculiarly-marked white legs and white forehead, and had also an old bay mare. The mare was sent to Bay Middleton; the groom who took her rode the chestnut, and the foal was as much like the chestnut as possible. That was a strong illustration of the sympathy of mares. Animals frequently "sported" in breeding; that is, they went on very well for two or three generations, and then changed their character. Thirty or forty years ago his father bought a very good sheep in Devonshire; but as it had a black foot it was blown upon, but his father had a good opinion of it. The black foot never appeared, however, till about twenty years after. He agreed with a preceding speaker that many farmers were a great deal too indifferent about the kind of animal which they used for breeding purposes. Whether it were a horse or a mare, a bull or a cow, they were too much influenced by the consideration of cost, forgetting the consideration of the character of the produce; and in his opinion that was an evil which was greatly to be deplored.

Mr. ALLD (Worsley, Manchester) thought they were very much indebted to Mr. Fowler for his excellent remarks on the principles of breeding. As to the influence of the female, they all remembered what was said in the Bible about Jacob (Hear, hear). In his own experience of dairy stock he had learnt that if they wished to have a good dairy the grand point was to get a cow which was produced by a bull that had a good milking mother. As regarded the complaint which had been made that evening of the difficulty of buying grazing stock, it seemed to him to arise from the fact that farmers were getting rather more wisdom on that point than they once had, and liked to sell their stock mature on the fat.

Mr. W. HARPER (Bury, Lancashire) said he could not help expressing his regret that no one had alluded in that discussion to the great name of Bakewell while speaking of breeding. It was asserted that Mr. Bakewell, who made up his Leicester sheep from a variety of sources, introduced a black ram of very superior quality, which he bought at Ashbourne market, in Derbyshire, and on that account it was said that the breed occasionally threw a black lamb.

Mr. E. TATTERSALL said it would be presumptuous in him to enter into a discussion on the breeding of cattle in the presence of so many eminent breeders, but as the man who made two blades of grass grow where only one grew before did good to his country, so did he who made two bullocks grow instead of one, or one of better quality. From some of the speeches a stranger who had come there might have been led to suppose that the agriculturists of the present day knew scarcely anything about breeding (Hear, hear)—that they had in that respect almost gone back to the dark ages, when the science of breeding was unknown. He had, in his ignorance and simplicity, fancied that this was a great breeding country, and that farmers knew something about the matter; but it now appeared that they were all going the wrong way. He thought, however, that he knew some facts which tended to the opposite conclusion. He happened to live on an estate belonging to Capt. Gunter, and he believed that in the last year that gentleman actually sold two Shorthorns for 2,500 guineas. But that was not all. Lord Dunmore, being anxious to secure and perpetuate the breed, sent to America and gave 2,500gs. for their two calves, and brought them back to England. This did not look like our breed deteriorating in value, taking £ s. d. as the test (Hear, hear). His (Mr. Tattersall's) grandfather was a great breeder of Southdown sheep; at seven or eight years of age he had often to go among the sheep pens, and he must say that he had not lately noticed that deterioration of breed which some gentlemen seemed to have found; on the contrary he thought they were advancing, though not, perhaps, quite as rapidly as they might do. It was most important that all those who were engaged in breeding should regard it as a science, which it certainly was. The whole science depended, Mr. Fowler had well pointed out, on the constant seeking out of good qualities in the male and female. The sympathies of the dam had been well understood from the time of Jacob down to the present day. There was nothing new under the sun, and Jacob knew as much on that point as any of them. He concurred, however, in the opinion that it would be a great advantage if the chief facts connected with breeding were collected and tabulated. He thought the breeding of cattle was, on the whole, being carried on very satisfactorily by the farmers of England, their attention being naturally directed to the production of meat. With regard to horses, Mr. Howard had raised a question of very great interest. Whether the influence of the father or that of the mother, were the greatest in the case of a thorough-bred horse he (Mr. Tattersall) was unable to say, but there were many cases in which he knew at once that yearlings were by certain sires. Mr. Howard mentioned a case in which a mare of his was sent to Grandborough and then to Wingrave, and both those animals being sons of King Tom, in the one case the result was a coarse animal, and in the other a very fine one. That might be explained in this way; King Tom was the son of Pocahontas by Glencoe, a powerful animal which never won a race, but bred Stockwell, Rataplan, and lastly King Tom. Pocahontas was a large big-boned mare, which looked much more like a hunter than a race-horse, and impressed her qualities on her progeny. Grandborough might throw back more to Harkaway, the sire of King Tom. The influence of sex had shown itself in different ways, through the medium of

the two horses. In the breeding of cattle and sheep the qualifications requisite for the attainment of the end in view might not be such as would secure a good race-horse. No one could tell by looking at a foal what would be the result. His experience with regard to race-horses showed that if they once chanced to get a really good mare care should be taken to continue the stock. Most great studs had arisen from one mare. General Peel's stud came from Vulture; Sir Joseph Hawley's stud, which was equally celebrated, came from Mendicant, winner of the Oaks, the dam of Beadsman, the sire of Bluegown and Rosicrucian. Mr. Panson had the good luck to buy in Scotland a mare named Queen Mary, from whom were descended Blink Bonny, and her son Blair Athol by Stockwell. Colonel Pearson's stud was descended from Paradigm—a moderate mare, but the dam of Lord Lyon and Achievement. Whether the influence of the sire or of the female had the greatest effect in the case of racing studs it was difficult to say. All such questions, which were questions of great moment, could only be worked out by scientific heads like those which he saw before him, and he thought the Club was greatly indebted to Mr. Fowler for having introduced a question which was of so much importance to agriculturists, more especially as they were certain that corn might be cheap, but meat never again in England.

Mr. TRASK (Orcheston, Devizes) said he merely wished to mention two facts that had come under his own observation. Mr. Fowler had said that where a white boar had served only white sows, the produce were invariably white; but after the same boar had served coloured sows, he got coloured pigs from the same white sows that before had only white pigs. He did not think this principle would apply in the case of sheep, although Mr. Fowler said it did with his white ducks. It was usual to put a Down ram with horn sale ewes, and he had put a Leicester ram with horn ewes, but those ewes would produce as pure horn lambs as ever, when again put to a horn ram. With regard to the point alluded to by Mr. Howard, that the feet of a foal always turned after a stallion. A neighbour of his put a cart mare, that had ringbones, to horse, and the result was that the foal also had ringbones, showing that it turned after the mother, and not the father in that case.

Mr. THORNTON (Langham Place) said there was one point connected with in-and-in breeding which Mr. Fowler somewhat overlooked, having special reference to Shorthorns. There were at the present time four fashionable tribes of cattle which command the highest prices, and these tribes, especially the two most in demand (Bates and Booth), were singularly closely bred. The most successful lines were those in which one animal was the sire of the sire and of the dam also—that is to say, half brother and sister by the same sire out of different dams. This system of breeding had produced some of the finest cattle in the country, and he believed had also been successfully tried in some cases with race horses. Where cattle were closely in-bred and preserved their constitutions, they had a tendency to lose colour, save perhaps in the ears, and to become white. The wild cattle of Chillingham were white. As another instance in pure bred Shorthorns, the bull Earl of Dublin, to which Mr. Fowler had alluded, was white, and extremely closely bred from the Princess blood. Seventh Duke of York, the last purely bred bull of the Duchess tribe, was white, and Eighth Duke of York, the bull nearest approaching Seventh Duke of York in pedigree, was white also. Many of Mr. Booth's cattle were white; Windsor, to wit, and Commander-in-Chief, a comparatively light roan bull, has begotten several white calves. In seeking pedigree bulls, quality was too often overlooked, and it was owing to that cause and the insufficient number of animals bred in the country, that it was so difficult to find good graziers.

Mr. JOHN THOMAS (Bletsoe, Beds) said as regarded horses he was a believer in Shropshire breeds. Forty years ago there was a good breed of useful hackneys: now the race of hacknies was almost extinct. That was a class of horses which he should like to see rising up again in this country, but he knew there was great difficulty in securing that object. At the period to which he had alluded the Shropshire farmers had a very good race of mares; but unfortunately they sold their good mares and afterwards bred from weeds, and the result was that the breed of horses was reduced to a very low condition indeed. His own experience—and he had been a breeder of horses for some years—had led him to the conclusion that a vast deal depended on the female. No man of common

sense who had a good mare would put it to a bad house; but after all the result depended in a very great degree on the mare. That principle was distinctly laid down by the late Mr. W. Youatt, who had been regarded as a great authority on that subject. He was inclined to think that without good marsh land for horses to feed upon it was impossible to secure animals of a large size and good quality. Where the land was poor it was vain to expect to rear horses of the same dimensions and quality as those which were produced in Lincolnshire, Ireland, and other parts which were known to be adapted for first-class hunters and other classes of animals (Hear, hear).

The CHAIRMAN said the time had now arrived when it was necessary to bring that discussion to a close. He was sure that all felt very much obliged to Mr. Fowler for the paper which he had read. To him it appeared a very satisfactory arrangement that the Club did not pass any resolution or formally arrive at any definite conclusion on the various questions which were discussed; for many of the papers which were read and of the discussions which followed the reading acquired increased value when they were read and thought over at home. He attached great importance to the consideration of that subject.

Mr. BADDAM, with the permission of the chairman, said, in opposition to the opinion of Mr. Fowler, as to Suffolk horses not flourishing anywhere except in the eastern counties, that Americans had lately offered 200 guineas for a two-year-old colt.

Mr. FOWLER in reply said he thought the discussion had tended to show that the principles which he had laid down with regard to breeding were in the main sound. Mr. Smythies was quite mistaken if he supposed that he did not attach great importance to quality. He held in his hand a letter which he had received from a gentleman who was well known in that Club—Mr. Clare Sewell Read. That gentleman, after expressing his regret that an attack of bronchitis would prevent him from being present on that occasion, said:

"I hope you will drive into your hearers the fact that the more ordinary the dam the greater the necessity for a *long-pedigreed sire*, and I know of no better illustration than the Irish cattle, which in twenty years, from the use of good Short-horn bulls, have been transformed from lean, hard, hungry brutes into capital grazing oxen." He (Mr. Fowler) thought that contained as good a condensed description of the best breeds of oxen in the present day as he had ever met with. He thought they must all concur in Mr. Meehi's remark with regard to the false economy often practised in the use of male animals. In his neighbourhood a large number of females were put to bulls of an inferior description, and the progeny sold as calves; and when such was the case it was no wonder that so many mongrels were turned into the fields. The evil was so great that he almost thought a Royal Commission should be issued to investigate the matter, and for his own part he would in every parish have every brute castrated that was not fit to produce a good race of animals. In the *Daily Telegraph* there appeared the following: "One of our best agricultural writers tells us that modern history has been much too sparing of its prose pictures of pastoral life. A great general or statesman has never lacked a biographer; but the thoughts and labours of men who silently build up an improved race of sheep or cattle, of which the influence is felt in every market, have for the most part no adequate record. It cannot be otherwise than advantageous to a country so thickly settled as these islands, that our noblemen and gentlemen of wealth and leisure should bestow money and brains in abundance in the creation of beef." It was well remarked by Mr. Grant Duff—not the present possessor of that name, but his father or grand father—that a good beast was a good beast, however it may have come, but it was to pedigrees alone that you could insure succession.

On the motion of Mr. Meehi thanks were voted to Mr. Fowler for his paper, and a similar acknowledgment was made to the chairman.

THE SCOTTISH CHAMBER OF AGRICULTURE.

LAND TENURE AND THE LAND LAWS.

At a general meeting in Edinburgh, the president, Mr. Smith, West Drums, Forfarshire, was in the chair.

The SECRETARY stated that a letter of apology for unavoidable absence had been received from Mr. Dingwall Fordyce, M.P., who wrote "It would be a great boon to Aberdeenshire if the law of entail were abolished, and if occupiers had the same compensation for disturbance in the occupation of their holdings and the same facilities for purchasing their farms as were given in the Irish Land Bill."

The CHAIRMAN, after introducing Mr. Caird, said—I would remind this meeting that from time to time portions of this subject have come up for consideration in the Chamber, and that certain resolutions have been passed in regard to these; but I expect that the present discussion will be of a more comprehensive and exhaustive character than any we have hitherto had on the subject, and that with the view chiefly of bringing the whole matter to the test of the great public opinion of this country. I trust, however, that it will be gone into in a spirit of freedom and fairness, candidly considering and keeping in view the great interests which are involved on all sides. He commended it to their consideration, believing that it would be so treated.

Mr. McNEEL CAIRD (Stranraer) then rose and said—I have willingly accepted the invitation of this Chamber to introduce for consideration the municipal laws which regulate the relation of landlords and tenant-farmers in Scotland. I do so in a spirit of perfect friendliness to both landlords and tenants, appealing to tenants to state their grievances in temperate language; appealing to landlords to examine them them without prejudice; appealing, finally, to public opinion to hold the balance even between them should they be unable to agree. The first point to which I shall ask attention is that, apart from stipulation, and by mere force and presumption of law, an ordinary farm lease cannot be effectually transferred by the tenant unless he can obtain the landlord's consent. The lease

is the tenant's property—very often, through his skill and expenditure, a very valuable property. I stand here to claim for the tenant one of the essential rights of property—the right to dispose of it. Consider the case of a tenant-farmer who has his means locked up in the land, and whose health or circumstances disable him to remain in the management, though he may have many years of a valuable lease to run. What is the worth of his valuable property then? He cannot sell it—he cannot sublet it. But the rent is growing, the seasons for cropping are running on. He is unable to wait. He can do nothing but cast himself on the mercy of the landlord. He is constrained to renounce the lease, and the landlord enters to his labours with such compensation, if any, as it is of his mere pleasure to give. Is it a righteous law which puts the tenant-farmer into that predicament? Take the case of a child, a few years old succeeding to his father's lease. Fortunate indeed will he be if he has friends possessed of the courage and the ability and will to undertake the grave risk and responsibility of farming for a minor during twelve, fifteen, or eighteen years to come. For if they are not, his rights also must be placed at the landlord's mercy. And then consider what may be the position of the tenant-farmer on his deathbed, with the bulk of his means invested in his farm. The law does not permit him to regulate the succession to his own lease. How is he to secure a home for his widow? His eldest son may be settled abroad, or have no knowledge of farming; he may be a spendthrift or a drundard, but the unfortunate father has by law no power to leave the lease to any other of his children. That is not the case with other property. The full owner of house or land may leave it to anybody he likes. The eldest son there takes only if the owner does not settle the property otherwise. Entails even are not an example of the contrary, for entails are not created by action of the law—each has its foundation in the will and act of the absolute owner. But in the case of the tenant-farmer, the law which

forbids him to transfer the lease has been stretched to exclude him from selecting his heir. Lord President Islay Campbell, when he was outvoted on this question on the bench, indignantly exclaimed "It is not common sense" for the landlord to control the tenant's succession. I may venture to add it is not common justice. But it may be said the landlord may give effect, if he chooses, to the tenant's will cutting out the eldest son. And no doubt he may, for this law is not founded, like some other laws, on any tenderness for the claims of eldest sons. It is a law expressly for the interest of the landlord; which can be pleaded by nobody but the landlord, which is, therefore, not available to the eldest son if the landlord chooses to accept the heir named by the tenant. And here is a climax to the intolerable wrong of this law. It puts both the eldest son and the selected heir at the mercy of the landlord. It practically gives the landlord power to choose between them. He could, if he pleased, play the one brother off against the other, and make any terms he liked. I willingly believe that such an extreme abuse of power would be indignantly reprobated by 999 out of every 1,000 landlords. But the arbitrary power is there. It is the sword hung by a single hair over the head of every tenant-farmer. That hair, to which he has to trust for safety, is the mere will of a fallible, and it may be capricious or offended man; and without suggestion of offence, I venture to say that arbitrary power over other men's rights is a dangerous thing, and can never exist in the established law of any country without leading, from time to time, to grievous wrongs and bitter resentments. On the other hand, it would be unjust that the tenant should have the power by disposing of the lease to escape from his obligations to the landlord. I think it reasonable that in any alteration of the law the original tenant should remain responsible to the landlord along with the tenant to whom he transfers the lease. The legitimate interests of the landlord cannot suffer any real injury by a transaction whose legal basis would be that he should have a new man bound to him along with, and in addition to, his original tenant. It may seem strange that the law should thus prohibit a tenant from transferring his lease, for this prohibition is the offspring of the common law, and the genius of the common law is generally hostile to restraints on the transfer of property. Entails are the work of statute overruling the common law. The truth is, that the courts of law had begun in very early times by settling certain principles which they thought applicable to agricultural tenancies in the state of things which then existed, and when courts of law have established the principles which are to guide them, they go on to carry out these principles as established, without much right to consider their policy, or the changes which time may make on the nature of industries. Lord Kames was a very ingenious lawyer, and directed his attention to the explanation from history of peculiar phases of law. His historical theory of the relation between landlord and tenant will perhaps amuse you, and if accepted may help to explain how the law has come into the present state. He says: "Lands originally were occupied by bondmen, who were the property of the landlord, and consequently were not capable to hold any property of their own; but such persons, who had no interest to be industrious, and who were under no compulsion when not under the eye of their master, were generally lazy, and always careless. This made it eligible to have a free man to manage the farm, who probably at first got some acres set apart to him for his maintenance and wages. But this not being a sufficient spur to industry, it was found a salutary measure to assume this man as a partner by communicating to him a portion of the product in place of wages, by which he came to manage for his own interest as well as that of his master. The next step had still a better effect, entitling the master to a yearly quantity certain, and the surplus to remain with the servant. By this contract the benefit of the servant's industry accreased wholly to himself, and his indolence or ignorance hurt himself alone. One farther step was necessary (and you must remember that this was written in last century) to bring this contract to its due perfection, which is, to give the servant a lease for years, without which he is not secure that his industry will turn to his own profit. By a contract in these terms he acquired the name of tenant, because he was entitled to hold the possession for years certain." It is legally certain that up to the fifteenth century such was the degraded condition of agricultural tenants, described in the statutes of that period

as the "poor people that labours the ground," that they were then liable to have their goods sold for their landlords' debts whether their rent was paid or not, and they were also liable to be turned at once out of their farms by a purchaser of the lands, though their leases were unexpired. Now, in the days when tenants were of anything approaching to that class, it is no great wonder if rules were established by the courts of law which placed their rights on a corresponding footing. And it is one of the conditions of judge-made law that when the courts get into a wrong groove they can hardly get out of it. Questions of policy are for the Legislature; and the time is at hand when the policy and justice of these laws must be reviewed by Parliament. In a country torn with intestine feuds, and when the landlords' retainers were expected to follow him to the field of battle, the risk of introducing an enemy into his band of followers led to restrictions on the transfer of leases which are wholly unsuitable now, and ought to be abolished. There was a case nearly analogous, and Parliament interfered very effectively with regard to it. Feus had the same origin with leases, and had at first much the same character. The feu was just a perpetual lease in which land was given out for a stipulated rent or return. The feuar in all our statutes is termed the tenant, and the feu-duty was in most cases the real rent of the land at the time. One of our best lawyers says, "a tack of long endurance to the tenant and his heirs is simply an heritable right, and to be considered as a feu-right." Now it was a common condition in feu-rights, till near the middle of the last century, that the feu should not be transferred without the superior's consent. This was found to be so impolitic and mischievous that an Act was passed by Parliament abolishing such conditions and making them illegal. But even after that, the courts of law went on to bind more closely on the neck of the tenant-farmer the rules by which (even irrespective of covenant) he was excluded from transferring his lease. I don't think it too much to expect that Parliament shall now do at last for the tenant-farmer what it did more than a hundred years ago for the village feuar. I intend to be very brief in regard to the law of agricultural hypothec, for it has been amply discussed, and has already been condemned by this Chamber. In words which I have used elsewhere, "it keeps the tenant under a perpetual mortgage even before the rent is due. It touches his credit, and hampers him in dealing with his stock and crop, and if misfortune overtakes him it operates most unjustly against his ordinary creditors." I think proprietors are considerably misled by this law. In the long run a proprietor cannot by any means whatever extract from the land more than it is worth. A particular proprietor may get more than his just share now and then, but taking it over a long term of years these things are sure to adjust themselves. If a landlord gets a tenant to promise him too much rent, the retribution will come in a year or two, and he may have to content himself with too little. The man will exhaust the farm and be turned out, the farm will get a bad name in the country, and good tenants will be shy of taking it. And I adopt and endorse the opinion which has been well expressed by my brother: "What we do object to is that the law should give inducements and advantages to landlords to enable them without risk to encourage men of straw to compete for farms, men whom under a different state of the law they would not accept as possible tenants. My only interest now in Scotland (he adds) is as a proprietor. But I feel very strongly that the present arrangement of the law places the tenant at an unfair disadvantage in making his contract, and while its removal would be just to tenants it would not take from the landlords anything they are entitled to, or that on the average in the course of years they could actually realise. For when a man without means gets a farm at a rent which in the end he cannot pay, his failure has a very bad effect on the landlord's interest, and the consequent loss is often far greater than the temporary gain." It is a public and may become a political misfortune, that the fears and prejudices of English landlords should have been invoked in Parliament to obstruct the settlement of a Scottish question upon which the prevalent voice of opinion in Scotland has been pronounced. It is always mischievous—its tendencies and results are the reverse of Conservative—to show to the people that legislation can be controlled by class influences or votes. But it would be all the worse—and I shall be slow to believe it—if any of the landlords of Scotland were systematically to cast themselves on the help of English landlords in the attempt to control or ob-

struct the municipal legislation of Scotland. I now come to the great question of tenants' improvements. When a man's lease is approaching its termination, every ton of purchased manure that he puts into the land is a premium to somebody else to offer a higher rent for his farm. Common prudence compels him to hold his hand, and to take out of the farm as much as he can get on a reduced expenditure, and the productive power of the farm is thus diminished at the end of the lease. This is a source of great national loss. It is hurtful also to the landlord, and hurtful to the incoming tenant, who incurs a heavy expenditure at the beginning of his lease to restore the fertility of the farm. The reduced production by which he suffers, and by which the landlord also suffers through him, commonly continues till he has at least gone over a full course of cropping. Neither is it for the advantage of the outgoing tenant, if he were protected against the loss of his unexhausted manures and tillages. The true interest of all concerned is that he should have a right, by law, to have their value ascertained and allowed to him on his removal. You might then expect that farms in general would be kept in full fertility till the end of the lease, and the whole country would benefit by it. Reflect for a moment on the amount of wealth which is lost to the country through the want of reasonable arrangements on this subject. Have we any means of roughly estimating it? On a seven course farm held on a nineteen years' lease you may reckon that the last five years will be a period of reduced expenditure by the outgoing tenant and of exhaustive cropping. Then the first seven years of the new lease will be a period of liberal expenditure and gradual restoration of productive power. In the next seven years you may expect the farm to be in full fertility; and then begins again the evil cycle of exhaustion. You will have on the individual farm seven years of Egyptianfulness alternating with periods of comparative leanness; but the lean years will be in the proportion of twelve to seven. Where there are no leases and no compensations on removal—judging by the motives by which men are commonly influenced—the leanness will be apt to become chronic, unless in exceptional cases, or where the character of the landlord gives a tenant all the security which he could have from a lease. Then consider that this kind of thing is in constant action all over the country. And when you remember the enormous value of agricultural produce in Great Britain, even as things are, you may form some conception of the untold millions of wealth which might be poured into the coffers of the country through the pockets of farmers, if by wise legislation on the subject, based on the motives by which men are acted on, you could sustain the land in full fertility during the whole nineteen years of a lease, instead of seven out of nineteen. I need hardly suggest that when the value of all that additional produce finds its way into the tenant's pocket, it is according to all experience that no inconsiderable share of it will soon pass into the rent-roll of the landlord. If we could raise the average rate of acreable produce in Great Britain by only one-fourth, which is not an unreasonable expectation, the result in money could probably not be less than forty millions a year. Again, if an enterprising farmer erects farm buildings, or labourers' cottages, or executes drainage or other permanent improvements, the law is prompt to punish him for his rashness. The house is no sooner built—the moment the improvement is executed, the law takes the ownership of it from the man who built it, and transfers it without compensation to the landlord. The high priests of the law pronounce the formula, *indefinitum solo, solo cadit*, and every tenant must bow his head and submit, so potent is this mystic phrase to juggle away the just interest that every man has in the work of his own hands. It contains a dogma of the legal creed which lawyers generally accept with unquestioning reverence. In plain English it just means "What is built on the land belongs to the land." It is an assertion, not a principle or even an argument—an assertion not always supported by fact or reason. We are told in God's law, "The sea is His for He made it," but in man's law the reading is reversed; the house is the landlord's though he did not make it. That is the law of Scotland. Is it reasonable? Is it just? Is the law to cast the balance always and irreversibly against the tenant? Our Yankee brothers have adopted the opposite principle for their unoccupied lands in the West. They call it the homestead law, and it is one main secret of the amazing growth of that great country. Its principle is, "Where a man builds his house and settles, the land shall be his." It is a wise and

noble law for an unappropriated country. So, you see, the rules of law are capable of being adapted, as they ought to be adapted, to the circumstances and wants of society. We of this country had once vast, almost illimitable tracts of unappropriated land in the colonies. And there never was a more gigantic blunder than was committed by our statesmen when they failed to establish a homestead law, available to every subject of the empire, before they abandoned the control of these lands. We have still large tracts of public and in this island—great commons, the birthright and property of the people, which are being encroached on, and frittered away and enclosed year after year by the pressure of neighbouring proprietors. Their extent is immensely greater than is generally known. I would just ask, in a parenthesis, might it not be an appreciable relief to our crowded population, if we had a wise and well-considered homestead law for these immense common lands, giving all reasonable priority to adjoining commons? But, with the exception of these commons, all the land in the island is appropriated, and our circumstances, therefore, require a rule regarding buildings different from the American rule, as well as from that which has hitherto prevailed in this country: I hope to see Parliament establish some such rule as this: What a tenant builds shall be his, and he may take it away unless he is paid for it. That would be just to both landlords and tenants. Our law, in spite of the big words in which it enshrines its theory of property, is so accommodating as to allow half the houses in this good city of Edinburgh to be sliced horizontally across into flats. In the High-street there may be twelve or thirteen flats built in tiers one on the other, each of which may belong to a separate owner, not the owner of the soil. So there can be no inherent difficulty in making the slice a few feet lower down, so that all that is below the surface shall belong to the landlord, and all that is above shall belong to the man who put it there, to be sold (if he be the tenant), when his lease is out, to the landlord, or incoming tenant, or to be taken away if they don't choose to buy it. If such a rule were established, it would lead to the improvements being generally valued over at the end of a lease, for it would not be the landlord's interest to let substantial and suitable buildings be pulled down, and it would be the tenant's interest to make them so. A right to have improvements valued over, when suitable to the holding, is really the practical result, and that I think is the result to which Parliament is likely to come. But there is another way which may contribute to the solution of this question with advantage to everybody. Parliament has for a number of years been in the practice of conferring upon life-tenants, clergymen, trustees, and others having limited or defective rights, the power of effecting permanent improvements upon rentcharge, under the direction of the Enclosure Commissioners. The Commissioners, at a trifling expense, examine into the improvement proposed, its permanency and suitability to the holding, consider the objections of everybody who has an interest, and if satisfied that it is really beneficial for all concerned, sanction and superintend its execution, control the expense, and give a certificate fixing an annual charge for a limited number of years, calculated so as to be equivalent to the cost. Why should not leasehold tenants be authorised to make application for improvements in a similar way? The tenant would meet the annual charge so long as he continued in the farm, the remaining years of the rentcharge would be to him on his outgoing a marketable security equal to his remaining interest in the improvement, the succeeding tenant would pay the annual charge till the term limited by the Commissioners should run out, and then the improvement would pass free to the landlord without his ever having had to put his hand in his pocket, and also with what ought to be, and but for the wrong notions which have been engendered by the present law would really be, a great satisfaction to him—the knowledge that it had become his without injustice to anybody else. It is a striking illustration of the blinding effect of a bad law that a landlord so well spoken of as the Duke of Buccleuch lately went into court to claim, without payment, the wire fences which a tenant had put up. That was too strong a dose even for the legal stomach. I feel convinced, however, that his Grace will be one of the first, when his attention is drawn to it, to consider in a just spirit the claim now made for the tenant. I have no doubt you have read with interest the story of Mr. Scott Russell and the Council of Skilled Workmen, and the

reiled Council of the Lords of Legislation. Some of the schemes which they broached are most commendable in their object, some (like the demand that goods shall be sold by retail at wholesale prices) are perhaps a little after the order of the conjurer who was to get into a quart pot, without reducing his size. But is it not a sad thing that the skilled workmen—the very aristocracy of labour—when promulgating their plans for regenerating society, had not a word or a thought for their humbler brethren, the unskilled labourers of the country? Is there to be nothing done for them? Their domestic accommodation in many parts of the country is simply disgraceful—without the means I will not say of ordinary convenience, but even of common decency. In examining some statistical papers, a few years ago, I came on facts which made a very painful impression on my mind. I have not had any opportunity of lately verifying the notes which I then made, but according to these there were in one county—the wealthy county of Ayr—more than 18,000 families, not fewer probably than 80,000 persons, living in houses of one room; and in all Scotland more than a million of human beings—actually above a third of the whole population—living in houses of that miserable kind. Of these, about 8,000 families, or from 30,000 to 40,000 persons, live in houses of one room without a window, lighted only by the door, or by an opening in the roof or side-wall, serving for both window and chimney. Who will stand up to justify such a state of things as this? Our law of strict entail disables, our law of settlement disinculcates a great many landlords to do much for the labourer's dwelling. And the labourer's employer, the tenant-farmer, his natural ally, who is most deeply interested in his well-being and well-doing, and who would gladly do something to lift him out of his degraded position, is sternly prohibited by law from improving the house accommodation of his people under the pain of having his expenditure confiscated to the landlord. If the people of Scotland were not an enduring and law-abiding people, the empire would have been ringing with the wrongs of that million of silent sufferers. I now pass from these great grievances to others, which, though of less capital importance, are sufficiently galling. The legal warning of forty days to leave a farm is quite inadequate. The exigencies of modern agriculture require a farmer to look a long way ahead. When he manures his green crop, or folds sheep on his turnips, it is in preparation for the grass crop which is to grow, not in that year, nor the next year, but the year after that. He prepares in summer the cattle that are to be fatted in winter. Whenever the corn is off the ground, the tillage for next year's crop should begin. He can hardly get his winter crops in too soon. Yet he may be kept in the most painful uncertainty whether he is to remove or not till he reaches the forty days before Martinmas. The old law was more reasonable. It made a difference between removals in May and removals in November, in the very month of winter. Till 1853 a tenant could not be removed at the winter term without notice forty days before the 15th of May. That gave him six months besides the forty days. But in 1853 there was a bill in Parliament, a technical bill to regulate the business of Sheriff Courts. A clause was slipped into it that there should be no longer a distinction as to removals between one term and another, that forty days before the actual term of removing should be sufficient in all cases. Away went the six months in one blow. I don't suppose there was any conspiracy against tenants, or any design to deprive them of what was a real and substantial security. It was treated as a matter of mere technical uniformity. The policy of it was not discussed. I doubt whether the authors of the bill conceived it to be a question of public policy at all. It was more probably a matter of downright blundering. An earnest protest by one vigilant man in Parliament would have put a stop to it. But it became law, and nine-tenths of the tenant-farmers did not know that the law had been changed upon them. That at least must be reversed. But since it brings under discussion the whole subject of warning to remove, I venture to say that, having regard to the expenditure which a man has now to make on his farm, and the necessity he is under of farming on plans which contemplate the future, no agricultural tenant ought to be removable on less than twelve months' notice at least. What am I to say of that shameful provision of the law which locks the doors of the courts of justice against a tenant when sued to remove from his farm, unless he can establish a defence instantly excluding the action, or find

security to the landlord for what are called "violent profits"? This is an exceptional law directed against tenants alone. I know nothing else in the practice of the law which at all resembles it, unless it be the case of a bankrupt who drags a man into court. It would be had enough if all tenants were treated as bankrupts. But the bankrupt's surety is limited to the expenses of suit; the tenant's surety includes the whole subject-matter of the suit, and a liability for damages and for all consequences at the highest rates. I doubt whether I could count by less than fifties the tenants whom I have myself known to be ejected from their possessions from inability to find security under this law. I don't wish to enlarge on it. I have already taken part in discussing it fully in a different shape. I see no objection, however, to leave in the hands of a judge a discretionary power to order surety if he should see a litigious tenant protracting an untenable defence in order to retain possession. I don't object even to the judge having the power, if he sees fit, to give the landlord possession till the end of the suit, if surety so ordered should not be found; but I protest against the system of turning a man out of court because he has no friends able and willing to back him, and I claim for every tenant the same equal justice in a court of law which is enjoyed by everybody else. I protest also against that unreasonable provision of the law by which a tenant who owes a year's rent may be required to find surety not merely for what he owes, but for five years' rents more in advance, under pain of instant ejection. I further wish you to consider the necessity of some provision in regard to penal rents for variations from prescribed rules of management. I suppose there is scarcely a considerable estate on which it would be possible for the tenants to follow without failure the multifarious rules which are prescribed. And it is common to have conditions that very heavy extra rents shall be paid in case of variation. The courts of law would deal justly by these, for the law says that no man shall inflict punishments or exact penalties beyond what the courts of law consider to be just. But the law is systematically evaded by declarations that such extra rents are to be considered pactional not penal. Landlords in general do not exact these extra rents; but they may be accumulated against a man without his knowledge, and may be presented for hundreds or even thousands of pounds at the end of his lease. When Parliament lays on penalties for offences, it usually provides that they must be claimed within six months, and shall not be recoverable thereafter. That would be a just method of dealing with this matter of penal rents. I have now gone, I hope with reasonable brevity, through the points which I think it right to bring at present under the notice of the Chamber. I have limited my observations to the tenancy laws; but if there be time to-day after we get through these, I will be most happy to take part in any conversation which may arise in regard to the property laws. I am bound in fairness to say that the existing state of the tenancy laws is not justly chargeable against the landlords. Only one, I think, of the laws which I have noticed has been brought in by Parliament where the interest of landlords might have been expected to predominate. Had the principle and policy of these laws been discussed in the Legislature, probably no one could have had the hardihood to propose such a system on the whole, as a just or satisfactory method of regulating transactions between man and man. They are, as I have said, the unhappy growth of principles adopted by courts of law in early times as suitable to a state of society and a system of farming which are long obsolete. But they are the source of recurring and substantial injustice, and I feel assured that if the tenant-farmers will join heart and hand in demanding their removal, their cry shall not be in vain. The hands of Parliament are probably too full to allow of much progress there on this subject in the coming session; but if the tenant-farmers speak out manfully, and resolve to act manfully, these things will take their place among the great questions of the next session. One thing is sure: there is no power in this country which can perpetuate injustice. I don't believe there is any considerable power possessed of the desire to attempt it. The great body of landlords are reasonable men, infinitely better than such a state of law might have expected to make them. If, indeed, the exceptions had not been limited in number—if one-half, nay, perhaps if one-tenth of them had exercised to the full the extreme rights which the law has given them—the agriculture of Scotland could not have been in its present con-

dition, and agrarian feeling might have run as strong in this quiet country as ever it has done in Ireland. The good sense and right feeling of the landlords as a body, and the good sense and patience of the people, have preserved us from that calamity. But no wise statesman will withhold the rectification of bad laws because they have not been worked to extremity nor because their amendment is not demanded with riot or menace.

Mr. A. E. MACKNIGHT (advocate, Edinburgh) said: The subject of the land question and its monopoly in Scotland is one of the most important that can occupy the attention of the public in regard to the vital interests of the country. The transference of political power which has taken place from the privileged classes into the hands of the householders has necessitated great changes, and will necessitate a great many more; but among all the questions for the consideration of the people, there is none more worthy of their careful and deliberate discussion as affecting their social condition than the question of the land tenure and cultivation. And what is our condition in Scotland as to this question? We find the soil of Scotland in a state of complete monopoly, in the hands of a miserable portion of the community. It has been computed that one-fifth part of Scotland is actually, or at least nominally, in possession of about a score families. The number of large estates is enormous compared to the area of the country, some of them consisting of whole parishes. Compared with England or Ireland, this fact is remarkable, because there property is much more equally divided, and the monopoly does not exist to anything like the same extent. Now, the first question presenting itself here is, Was Scotland always in the same condition of land monopoly? The answer is, No. The evil is of comparatively modern date. Up to nearly the period of the Revolution of 1688, land was held generally under estates of from 200 to 300 acres in the lowland and arable parts of the kingdom. In the Highlands and pastoral districts the size was generally larger. During the feudal ages, previous to the Revolution of 1688, although there were cases of large grants from the Crown to favoured individuals of the aristocracy, yet by the general practice of proprietors giving every one of their children landed estates when they were in a position to do so, the large estates were generally sufficiently divided in the course of a few years. To give one remarkable example: The wealthiest and largest proprietor in Scotland was the Earl Marischal, having a rental of £260,000, yet such was the process of division by giving portions to all the members of the family, that when the Earl Marischal of the period went out in the Rebellion of 1715 and was forfeited, the whole remaining property amounted to about £2,000 a-year, which was sold to the York Buildings Company in 1720 for £11,000. But the great cause which has produced so much evil in the shape of the land monopoly is the law of entail passed in 1685. Before this period it was incompetent by law to settle land upon a series of heirs unborn, and to tie it up *ad infinitum*, and the courts of law looked with great jealousy on the Act, which was always strictly interpreted and entails broken whenever they were not strictly accurate. But notwithstanding this fact, the process of extending has gone on to an enormous extent in Scotland. So far back as the middle of the last century the evils of the system were deeply felt. The ablest political philosophers and lawyers have joined in the condemnation of the system—such as Dr. Smith, Lord Stair, and Lord Kames. The organs of such public opinion as existed at the time denounced it—the Convention of Royal Burghs and the Faculty of Advocates. Even then a large proportion of the land was strictly entailed, and in many districts there was hardly an acre which was not under entail. Since that period the evil has gone on increasing, notwithstanding certain remedial Acts which were intended to give relief, but which in their operation have very completely disappointed expectation, and it was not till 1848, when Lord Ruthven passed his Act, that some real relief was given by enabling certain entails to be brought to a close. But the evil still goes on, and half measures will be of no use to rid the country of this evil and monopoly; nothing but a total prohibition of the whole system will be sufficient, and I think nothing less should content the people of Scotland. The evil was far less then than now, when the population has so much increased, and when the question, What shall we do with the surplus population? has become so vital and important. But another subject here presents itself, viz., the great change that

has occurred in the mode of supporting the poor in Scotland. Previous to 1845 the Poor-law was in a great degree practically voluntary, but by the Act of 1845, passed by the Tory Government, this was rendered compulsory, and now the whole landed property of the country is practically confiscated for the support of the idle, the drunken, and the dissolute, as well as those who really are unable to work: and what has been the operation of this law? Why, only an enormous and steadily surging increase in the amount of the rates, an enormous amount of jobbery and extravagance in the parochial boards, in exorbitant salaries to the officials, and in building palaces at an enormous expense, instead of building prisons or boarding the paupers out, which could be done at far less expense. But what has been the operation of this Act in regard to the land question? Why, to make the proprietors of land continue to pull down cottages to drive the people off the estates, in order to drive them into the towns to swell the misery and want of employment which prevails there, and render them permanently a burden on the city proprietors; and the object of all this is to save themselves from the burden of the poor-rates. Now, if these persons thus driven off from the country could maintain themselves and their families if they had a few acres of land and pay rent faithfully, and if they could pay a higher rent for the land than is now paid by the large farmers, then the country is doubly injured by their compulsory removal into the towns to be maintained in idleness on the rates. That these are facts the best scientific agriculturists are compelled now to acknowledge both from scientific researches and practical experience. The Prussian scientific agriculturist, Von Thaer, although at first inclined to think the system of large farms yielded most produce to a country, entirely changed his opinion in consequence of the researches he had made. Those who have had an opportunity of seeing one of our British possessions—the Island of Jersey—will see a country wholly composed of small proprietors, and they will there see the wonders produced by that system—the whole island cultivated like a large garden. The Norman law of equal succession prevails, and David Low says the effect of this law in 900 years has been to put the entire island into small holdings. There is scarcely to be found a property of more than fifty acres, many say from four to fifteen, and most of them are less than fifteen. Is the agriculture there poorer? Certainly not. It is cultivated like a garden. It is farmed at an average of from £4 to £5 an acre, and in the neighbourhood of St. Heliers at from £8 to £12. In spite of these enormous rents, which are actually higher than they appear, as money is more valuable there than here, the farmers live in a state of comfort upon an extent of ground which elsewhere would not suffice to maintain the poorest labourer. I have myself visited Jersey, and can corroborate all that is here said. The gross produce raised per acre is almost incredible. I went over the property of a gentleman who was farming it himself; it consisted of about 25 acres, on which he kept three horses, a number of cows and pigs; from the data furnished to me the gross produce raised by him amounted to the value of £22 per acre over head, equivalent to more than £25 per acre here. The soil is not naturally rich, but is most carefully and plentifully manured, abundance of stock being kept to produce it. The same circumstances take place in the Isle of Man, the agriculture of which, under the system of small properties and small farms, flourishes greatly, also on the Scilly Islands, where the same system prevails with admirable effects, as a competent observer recently communicated to the *English Agricultural Journal*. The experience of Switzerland testifies loudly for this system. There you have minute properties beautifully cultivated, every foot of land turned to account, and the produce enormous compared to the area employed in producing it. The Tyrol and the Palatinate furnish evidence of the same thing; nay, it is found that in those parts of Switzerland and those countries where the estates are the smallest the cultivation and the produce is greater than where the land is held in larger quantities. In France, before the Revolution of 1789, the state of agriculture was most wretched, the tenantry were ground down with the most oppressive feudal exactions, an intolerable game-law, and a miserable and starving peasantry. But after the sale of the larger estates belonging to the Roman Catholic Church and the emigrants, and when the soil of France was divided, there was marked improvement in the cultivation, and an enormous increase in the amount of produce, which has been going on increasing

ever since. In Prussia a great revolution was effected in the land tenure of the country in 1806 by the great statesmen Barons Stein and Hardenberg. The effect of this was to subdivide the large estates and create a numerous body of peasant proprietors. Well, then, what has been the effect of this? Why, to extend and improve cultivation in Prussia, to double the produce, to make it an exporting country, besides feeding all its own inhabitants, and to lay the foundation-stone of that wonderful energy, comfort, and prosperity which has resulted in the realisation of the unity of Germany and the overthrow of her restless enemy, France. Look again to Belgium. What country in Europe has done so much for agriculture under difficulties? She was the earliest to adopt improved courses of husbandry. But this was not effected till the abolition of the large estates, and their purchase in moderate lots, and also being held in moderate-sized and small farms. The remarkable report which was prepared by Mr. Radcliffe after a careful examination of the Belgian husbandry, clearly proves the wonderful effects produced by it; and it further proves, that in the districts in Belgium where the farms were the smallest, the cultivation was better and more productive than where the farms and properties were largest. But let us now come nearer home and revert to the state of Ireland. Since the Revolution of 1688 that country has suffered the evils of enormous estates held by absentee and embarrassed owners, men who could not fulfil the duties of ownership, and who consigned their lands into the hands of middle men who exacted exorbitant rents from the terrified peasantry, and drove them out if they did not pay these rents. Thus it is the land question which has caused those terrible outbreaks which have occurred for more than a hundred years in Ireland. Well, then the Liberal Government passed the Encumbered Estates Act, which has had the most wonderful effect in getting quit of bankrupt proprietors, and dividing the country into moderate-sized properties; and what is a most remarkable fact, these estates have been chiefly bought by Irishmen, and with Irish capital, and the country is being gradually filled with a resident and responsible proprietary. Now, we want the same thing in Scotland—we want an Act for the sale of Encumbered Estates in Scotland, so as to facilitate the transfer of the land into responsible hands. What is the deplorable position of the landed property in Scotland in regard to debt? Why, it has been computed that nearly two-thirds of the land rental of Scotland is in the hands of creditors, the owners having practically no control over it. The creditors, provided they get the interest of their bonds, care nothing for doing anything on the estate, and the owner can do nothing, as he does not receive the rents. At present three of the largest estates in Scotland are under trust, the owners having no power to do anything in regard to them. Can anything be more of a wretched deadlock than this? Is it not notorious that in regard to entailed estates you can tell them by the wretched and miserable cultivation which they receive? If you create a series of life-rents it is the object of the life-renter to squeeze as much out of the estate during his life as he can, and to rob it of all that it should receive. In regard to the tenantry, the question is What rent will you give? and if the reply be What will you (the landlord) spend on improvements? the answer is, *Nothing*; and the effect is that if the tenant invests his capital in the land, and if he falls into difficulties, and cannot pay the rent during the lease, he is turned out and robbed of the whole sum he has spent on improvements, and the land let to some one else at an advance of rent produced by his money. This state of the law is disgraceful, and I only wonder at the apathy and forbearance of the tenantry in bearing it so long. We must demand an Act for compensation for unexhausted improvements; and I hope the Chamber of Agriculture will be unanimous in this after the full explanations given by Mr. Caird in regard to it. It would effect great good, and we must have such a bill as was brought in by the Lord Advocate last year to abolish Scotch entails, but amended so as to prevent the English system of entails from being introduced, which was to a certain extent admitted by that bill. The Chamber has already petitioned for that bill as amended, and although the agricultural mind is proverbially slow, the land monopoly is at the root of all the evils from which the tenantry suffer. But further, the people of Scotland must demand an alteration in the law of succession, as the present law causes such terrible injustice. If a man dies after having invested his means in

land and leaves several children, and not having made a will, the whole would go to his eldest son, leaving almost nothing to the rest; therefore the law should be altered; and if a man dies without a will, his property, heritable and moveable, should be equally divided among all his children, sons and daughters alike. But I go further than this; I think that no one should have the power of disinheriting any of his children, and the law of succession should be made equal and compulsory. This law has been productive of enormous benefit in France, in Prussia, and America. It gives satisfaction to the great body of the people, and no government in these countries, however anxious, could attempt to repeal it. It is certain, I think, that it will be carried sooner or later in this country when our public opinion is ripe for it, and considering the rapid advance we have made recently in political questions, no one can say how soon that may be. And lastly, we want a measure for Scotland similar to the Irish Land Act, to facilitate the acquisition of small properties by the people, and to compensate unexhausted improvements of the tenantry. The expense of preparing titles to land should be diminished, the stamp-duty should be remedied so as to encourage the purchase of small properties. It is very provoking that Ireland should receive so much more attention from Parliament than Scotland; one reason seems to be that we have got too quiet and not sufficiently clamorous. Let us cast off this sloth, and by means such as this Chamber presents, publicly, loudly, and persistently demand those reforms from the want of which we have suffered so much. The land question is the real battle to be fought. I wish my voice could be heard all over the country, urging that the people should never rest satisfied till it is settled in a satisfactory manner and according to the principles of justice. Then we shall have Scotland for the Scotch; bold and stalwart yeomen will again be restored to the "land o' cakes and brither Scots," and a happy and contented peasantry, not dependent entirely on the precarious wages of labour, will cultivate with energy and pleasure their fields, and prove the truth of the inspired proverb that there is much food in the tillage of the poor.

Mr. RIDDELL (Hundalee) said the paper read by Mr. Caird has exhausted almost every idea I have on the subject, but I wish to make a few remarks regarding it, and as these remarks come from a tenant-farmer, if they have the slightest effect in giving tone to the able speech of Mr. Caird, I shall feel amply rewarded. I shall endeavour to show that the general practice of the laws referred to by Mr. Caird might be a very great inconvenience and discomfort as well as loss to the tenant-farmers. In regard to the reference to the law of entail, I will pass that over at this time as being a matter not so much before us as the other parts of the subject. It has occurred to me that it will be necessary to assume certain cases in order to bring out the difficulty and the discomfort that arise out of our present Land-laws and their provisions affecting the occupation of property. The effect of this particular part of the Land-laws has been strongly brought out by Mr. Caird, and any practical farmer knows the result of it. But, passing from this knotty point to one that perhaps more immediately concerns us at the present moment, I would refer to some cases to show that the occupation of land in this country is far from being in a state suited to the requirements of the present age. For example, a farmer may become unable to carry on his farm, executes a trust-deed, the trustees find it necessary to vacate the lease, and wind up the business. The tenant may have laid out a considerable sum of money in improvements, such as building, draining, &c., and notwithstanding all this, neither he nor his creditors are entitled by law to any part of the rise of rent which in such circumstances usually occurs, or recompense for unexhausted improvements. A worse case than the one just referred to might easily occur. A landlord may let his farm to a man who is almost penniless; the latter may borrow money from all and sundry to start his farm, buying lime, tiles, manures; in fact, sets his farm agoing on money got from the public, which money all goes to improve the land. Well, what may happen? The farmer comes very soon to anchor, leaving not a farthing behind to pay his creditors; the landlord sweeps the table, legally pays himself, and besides re-lets his farm, maybe at hundreds a-year more, all legally of course, but not the less a hardship and an injustice to his creditors. Our Land-laws may frequently be a great inconvenience and loss to families where the father is removed by death, leaving a widow and family, where the comfort, con-

venience, or the necessities of that family require the lease to be given up, although the remaining years of it may be worth a considerable sum; legally all must be left to the landlord. The law as it stands operates much against the keeping up the continuous fertility of the land, the tenant not having the right to payment of unexhausted manures, &c., at the termination of the lease. The landlord is not bound to give it, and the tenant must either suffer loss from the want of such accommodation, or lay out the money himself on these improvements, which will go into the pockets of the landlord at the termination of the lease—this is in a case where the landlord is either unwilling or unable to advance the money necessary for the carrying out of such improvements. It is frequently said, and apparently believed by not a few, that tenants are quite safe in the hands of landlords, for undoubtedly they would in that case be dealt with in a most liberal manner in all such cases as those referred to. But seeing that the question is not one between landlords and tenants, but has reference to the law of the land, perhaps blinding landlords to the hardships and even injustice that many a time occur, the question may with great propriety be asked, Were the present Land-laws necessary and somewhat just at the time when they were enacted? Assuming that they were, and the circumstances of the country—of landlords and of farmers—were unaltered, the Land-laws would still be necessary and equally just, and ought to remain un repealed or unaltered. But I venture humbly to say that the circumstances of the country are not only quite changed, but the relations between landlords and tenants are also changed. When these laws were made, very little, if any, capital of a permanent nature was invested in the soil by the tenant. Now, however, it is no uncommon thing for tenants to invest large sums of money, which, to all intents and purposes, some may say, are as permanent as the soil itself. In not a few instances tenant-farmers expend nearly as much on poor land per acre as the same land would sell for if brought into the market. In these circumstances I do not hesitate to say that this Chamber should use every legitimate means for getting repealed or altered all laws relating to land not in keeping with the altered circumstances of the country, and at variance with the best interests of the community. If not altered or repealed, the continuance of these laws is calculated to cause a great amount of irritation and mischief between parties whose interests are, or at all events ought to be, identical. The connection between landlord and tenant is of too close and important a nature to be so lightly broken. The paramount interest of society is to have the soil properly cultivated. Who, I ask, can stand up and advocate the continuance of the laws relating to tenant-occupancy of land, of hypothee, and game in all their integrity? We sometimes here of compromises, of taking this or that as an instalment. I believe that nothing short of repeal of some of these laws and the alterations of others will have the effect of permanently increasing the fertility of the soil. Adam Smith truly says: "Whatever increases the fertility of land in producing food, increases not only the value of the land upon which the improvement is bestowed, but contributes likewise to increase that of many other lands by creating a new demand for this produce. That abundance of food, of which, in consequence of the improvement of land, many people have the disposal beyond what they themselves can consume, is the great cause for the demand, both for the precious metals and precious stones, as well as for every other conveniency, and ornaments of dress, lodging, household furniture, and equipage. Food not only constitutes the greater part of the riches of the world, but it is the abundance of food which gives the principal part of their value to many other sorts of riches." And I may add, it is a well-known fact that abundance of food in the land makes a loyal, happy, and a peaceful people.

Mr. SCOT SKIRVING said Mr. Caird had said nothing to which they would not all agree, and which, if pressed, had a fair chance of being soon made law in the way he pointed out. Some of these laws were so bad that he was really ashamed to say that he had never heard of their existence, and Mr. Caird had pointed out that the reason was the good sense of the landlords had made them dead letters; but they were still repeated in the leases and covenants. He wished to ask Mr. Caird if he included in "commons lands" the crown lands.

Mr. CAIRD replied in the negative. The crown lands were private property—the property of the nation in a different sense. What he had been speaking of was the commons lands, waste to a large extent, on which great numbers of people in the neighbourhood had a right of common, and turned out cattle on them.

Mr. SCOT SKIRVING said there was one of these in the county where he resided, and instead of being waste it was used by too many beasts.

Mr. CAIRD: And the consequence is that there is not enough for any of them.

Mr. SCOT SKIRVING said it would be worse to let squatters put up huts upon it. He had to move—"That the Chamber tender thanks to Mr. Caird for his address on the land tenancy laws, and remit to the directors as a committee, with power to add to their number, to have the paper printed and circulated, and also to appoint a day for the further discussion of the subject."

Mr. GOODLET (Bolshan) seconded he motion. The paper was a most admirable one, and was calculated to do a great deal of good if widely circulated over the country and read by our legislators. He suggested that the committee should be also empowered to gather facts bearing upon the subject. These would make any representation to the Lord Advocate or Parliament far more effective. His object in proposing this was not to bring up invidious cases against individuals, but to obtain well authenticated facts to show the working of these laws and the necessity of reforming them, not only in the interests of the tenant-occupiers, but also in that of the landlords themselves and of the country generally.

Mr. WALTER WILSON (Hawick) did not think it would serve any good purpose to inquire into the practice of the laws. The laws were there, and it would be better to argue against them from their obvious tendency. He thought they should endeavour to discover the Lord Advocate's views on the subject of leases and improvements made by tenants.

The motion was ultimately passed in the following form: "That this meeting return thanks to Mr. Caird for his address upon the land tenancy laws, and remit to the directors as a committee, with a power to add to their number, order the same to be printed and circulated, and that facts and information bearing on the question raised should be collected by the committee."

The motion was carried, and Mr. CAIRD, in reply, remarked that it did not seem to him right in his paper to complicate the discussion of the question of the land tenancy laws with the totally distinct question of the entail laws. He thought also that it was better to try and show what were the inevitable results of the tenancy laws than to attack particular individuals. He thought it would be a grievous mistake for them to enter upon the line of attacking anybody. The laws were bad—so bad, indeed, that it was humanly impossible that they could work well. If they took that ground in their argument, they were bound to succeed. They would only provoke opposition, that might otherwise not be roused, by taking the argument of individual hardship.

The Chamber then adjourned.

IN - A N D - I N B R E E D I N G .

At the last meeting of the Farmers' Club, Mr. Thomas Congreve "was sorry to say that year by year it became more and more difficult to buy a lot of good beasts to graze. Whether he desired to get Shorthorns, Here-

fords, Welsh runts, or any other kind of stock, he felt the difficulty to be increasing every year, and that certainly seemed extraordinary, considering the immense amount that was spent in prizes, and the vast amount of discus-

sion that had taken place. Looking back to thirty years ago, he believed that graziers were now in a worse position in that respect than they were at that period. Mr. Smythies, who was a Herefordshire man, would bear with him for saying that the Herefords were getting lighter, more gaudy, less deep in the thigh, less fleshy than they used to be. What graziers wanted was an animal that would carry some butcher's meat about it." Earlier in the season Mr. Sanday said at Newark that "Shorthorns were inferior both in size and quality to those bred twenty or thirty years ago." At the same meeting Mr. Colton, another acknowledged judge, said, "the Shorthorns now bred had nothing like the flesh they had twenty ago;" and at the Farmers' Club discussion, Mr. Thornton, the auctioneer, and for some time assistant editor of the *Shorthorn Herd Book*, said, "there were at the present time four fashionable tribes of cattle which commanded the highest prices, and these tribes, especially the two most in demand, Bates and Booth, were singularly closely bred. The most successful lines were those in which one animal was the sire of the sire and of the dam also; that is to say, half brother and sister by the same sire out of different dams. This system of breeding had produced some of the finest cattle in the country, and he believed had also been successfully tried in some cases with race horses. Where cattle were closely in-bred and preserved their constitutions, they had a tendency to lose colour, save perhaps in the ears, and to become white. The wild cattle of Chillingham were white." And further on, "Commander-in-Chief, a comparatively light roan bull, has begotten several white calves. In seeking pedigree bulls, quality was too often overlooked, and it was owing to that cause and the insufficient number of animals bred in the country, that it was so difficult to find good graziers." Here, while admitting the decline of good graziers, the remedy suggested is *quality*; while at Newark the cause of this decline was mainly attributed to "the principle on which most herds are raised, viz., the fashion, or rather infatuation, of collecting from certain families without any regard to the qualifications necessary for producing and perpetuating good animals. To follow out this plan in-breeding must to a very great extent be resorted to." So says Mr. Sanday, as Mr. Colton, again, declares that "the deterioration of Shorthorns must be owing to breeding in-and-in too much."

Thus, it will be observed, we have these several speakers at direct issue. Equally willing to allow the full force of Mr. Congreve's complaint, Messrs. Sanday and Colton maintain that the cause is in-and-in breeding; as, on the other hand, Mr. Thornton tells us that the corrective will be found in the use of pedigree bulls of more quality—a phrase, which being interpreted by the context, goes to say that the best quality bulls are those which are "closely in-bred." He further assures us that "this system has produced some of the finest cattle in the country;" whereas, Mr. Sanday says, "some thirty years ago he saw some Shorthorns at Mr. Booth's, and he was quite convinced there were no such cows like them now." Mr. Thornton, however, cites some of the modern stars, the latest of his appearances being Commander-in-Chief, "a comparatively light roan bull," with a poor weak steer's head; as if this be cited as an example of any in-and-in breeding it is not a very happy one, for the animal fails just where one might expect him to—that is, in masculine character. Or, take another famous tribe quoted by Mr. Thornton, and perhaps the most carefully in-and-in-bred family on record, the Duchesses, and what became of those which at least at that time "commanded the highest

prices?" They were simply the greatest of failures. The luckless Betts-Bates Duchesses, if not utterly barren lacked the power to carry their calves. If, says Mr. Thornton these in-and-in-bred animals "preserve their constitutions, they have a tendency to lose their colour," and their flesh, and their procreative powers. It is well known in the human race that the continual intermarriage even, so far as sanctioned by the law, tends to every kind of weakness both of mind and body, until Nature interferes and indignantly blots out these imbeciles from the face of the earth. Mr. Valentine Barford bred his Leicesters so closely at home that at last there was little left but their fleeces and pedigrees; and with stock where do we find the thin papery touch and the weak feminine head most prevalent but in those animals which have been so jealously bred in-and-in? Again, how is it that the once-famous Hereford steers are growing "lighter, more gaudy, less deep in the thigh and less fleshy than they used to be?" mainly, as we take it, because there is now but one kind or variety in fashion instead of three or four. In other words, there is less opportunity for commanding a good cross. Nothing now will go down but a white face, and yet one of the best Hereford oxen we ever saw was a cross of a white and mottle.

Some ten or twelve years since the late Mr. Dixon, who was busy just then over his HERDS, said in print: "We should uncommonly like to see how Pocahontas would hit to Stockwell or Rataplan (her own sons); and there can be no reason, when the plan is tried so successfully among Shorthorns, why racing men should quite shrink from it." Barring men were so outraged by the very idea, that the writer shrank from his own proposition; stating in explanation that "as for advocating such a plan he never dreamt of it." Sixty years since an experienced breeder of race-horses wrote how "the necessity of crossing to prevent *degeneration* is an important study in every species;" and the maxim is as good now as when it was first penned. Of course there are cases of in-and-in breeding for the turf which have proved successful, but these are very exceptional, and very different from the plan of getting back to the same strain of blood after a separation of some generations. Whereas, by "Belvidere dam by Belvidere," or a pedigree depending on a heifer being served by her own sire, excites no feeling of revulsion amongst the Shorthorn fancy, but is the rather prized as the proper thing and the attainment of all excellence. Hence it happens that we hear of animals which have neither size, symmetry, nor flesh, being sold for thousands on the strength of pedigrees which are in principle radically wrong and unwholesome.

There can be no getting away from facts; our butcher's beasts are gradually deteriorating, while some go further, like Mr. Sanday, and maintain that our breeding animals, even of the highest caste, are by no means so good as they were. And why so? The old ethic was that nothing tells better than a good cross of the same breed, as that periodically you must go in search of this. Whereas the fashion now-a-days is to keep to your own strains and families, and buy and sell without caring to look at them as they did the luckless Duchesses in Willis' Rooms.

THE YORKSHIRE AGRICULTURAL SOCIETY.—The Earl of Feversham has been elected president of the Yorkshire Agricultural Society for the ensuing year.

THE PRODUCE OF THE SEA-SHORE.

BY CUTHBERT W. JOHNSON, F.R.S.

When inquiring, during the last two months, into the habits of the salmon, at the mouth of some of the Cornish rivers, I could not avoid noticing other important contributions derived from the sea. Wherever the tourist visits these grand iron-bound coasts, he finds the Cornish farmers employed in carting away from the shore either the sand or the seaweeds which are found there in such great abundance. Thus, on the beach at East Looe, on an extent of about two hundred yards in length, on one night in September there must have been at least one hundred two-horse cart-loads of seaweed left by the tide, after an on-shore gale. These weeds were of different kinds, the greater portion being of a large variety, green and juicy, the leaves being three to five feet in length and three or four inches broad.

The farmers' carts come for these when the tide has receded, and cart them as far as even three or four miles from the shore. Other landholders carry these weeds in barges up the estuaries, and, as is the case at East Looe, in such vessels as are able to enter a canal, so that these weeds are used as far as five or six miles from the sea. Then again they are carried on to the fields in large wooden panniers by donkeys—especially on those portions of the coast of Cornwall and Devon where the cliffs are so elevated that it is only by zig-zag paths that even donkeys or ponies are able to carry their loads.

It was on the 27th of this last September that a strong south-westerly gale, at the height of a spring tide, drove an enormous quantity of seaweed on to the beach at Penzance. The shores of Mounts Bay, from Mousehole to Cudon Point, were in fact lined with these weeds, some of which are very beautiful, and appear as if full of a gummy juice. On the following morning, at low water, there were many carts employed in carrying the weeds on to the shore, and piling them in great heaps just above high water mark; but these heaps were all removed during the same afternoon. The farmers around Penzance use them very largely for their celebrated potato and cauliflower fields, from which the metropolitan market is so extensively supplied. From an early hour in the morning many labourers were employed, on the shores of Mounts Bay, with rakes having peculiar long iron-teeth, in collecting together these weeds, for which they are paid by the farmers from 1s. per cart-load when the weeds are plentiful, to 1s. 3d., or 1s. 6d. per load when they are obtained only in such limited quantities as to require them to be even cut from off the rocks.

These weeds are best applied to the land in their freshest state. It is true that they are largely used after being mixed with farm-yard manure or sea-sand; but all the Cornish farmers with whom I conversed concurred in opinion that they should be ploughed into the ground in their greenest state, and that they employed at least thirty loads of these per acre, and that if the weeds were readily accessible they would dress the land with double or treble that quantity. It is only in modern times that seaweeds have attracted the attention of the botanist. The Rev. D. Lunsborough in his very excellent "History of British Seaweeds" has thus described the extent to which they were formerly neglected. He observes: "About fifty years ago, in some academic chairs, they were treated with disdain. We have heard of a student who about that period having collected some

beautiful *Algæ* on the sea shore, showed the contents of his vasculum to the professor of botany whose lectures he attended, in order to get some information respecting them. The Professor, after looking at them, pushed them from him, and exclaimed, 'Pooh! a parcel of seaweed, sir, a parcel of seaweed!' The Newhaven fishermen seem to have caught the spirit of this learned Professor, for to this day they denominate all the finer seaweeds *chaff*. They are weeds, and what are weeds? Dr. Johnson tells us that they are plants that are *noxious* and *useless*. But they are *seaweeds*, we say, in mitigation. And does that mend the matter? Horace spoke of them as '*Intillis algæ*'—useless seaweeds. And Virgil goes even beyond his friend Horace, for when speaking of something which he regards as worthless and filthy, he says it is '*Alga projecta vilior*'—viler than the seaweed cast out upon the shore. Its very calamities are turned against it. '*Refunditar algæ*,' says another poet—the sea loathes it and casts it out. In Scotland, seaweeds go very generally under the name of *wrack*, or in the south and west of Scotland *wrecks*, and in this we have one of the many instances of the effect which the great intercourse in ancient times between France and Scotland had on our Scottish language, for what is *wrack*, or *wreck*, or *wreck*, but the French word *varcech*, which signifies seaweed? In the Channel Islands *vraic* is the word employed."

It is interesting to follow these seaweeds into their widely-dispersed localities. This has been done by Dr. F. Meyer in his "Geography of Plants," in language which it is needless to vary. He observes in his work, translated by Miss Johnston, and published by the Ray Society: "The *Fuci* solely belong to sea-water; there are true *Fuci* found in the Caspian Sea, though at the present day it is unconnected with the ocean. Almost all the marine plants are rooted at the bottom of the sea, chiefly on rocks, and near the shore, where the water is shallow; nor do the *Fuci* seem to go to a very great depth, though certainly as deep as a few hundred feet. It is true that some have been measured, and have been found to be more than 300 feet in length, such as the *Fucus pyrifrus*, at Cape Horn, the leaves of which are seven or eight feet long; but these, as I have observed of other plants on the West Coasts of South America, do not grow in a straight direction from the bottom to the surface of the sea, but lie rather horizontally, and therefore, though of so extraordinary a length, can grow in water of much less depth. The Straits of Magellan and La Maire are full of this gigantic *Fucus*, and there, in the cold water, where it grows to an extraordinary size, seems to be its true zone. This *Fucus* is found in the New World, through all the zones from the extreme north to the extreme southern point. The same plant also appears at the Cape of Good Hope, and Baron Humboldt brought it from the tropical seas, but in neither place does it grow so large as around Cape Horn.

On the coasts of the ocean where the great *Fuci* grow, they cover the bottom of the sea with an impenetrable vegetation, which serves to support millions of animals. When sailing over such regions in a calm sea, we enjoy the splendid sight which these submarine meadows and forests present to the eye, the variety and splendour of which is increased by tall corallines, Madrepores, scarlet sea anemones, and corals of various colours. At ebb-tide

the *Fuci* in general are close to the surface, they are often left quite uncovered, and begin to dry until the returning tide again refreshes the flagging plants. But when the sea is agitated by storms, when the waves dash with violence against the rocks, those marine plants are torn up, and float on the surface of the water, until they are thrown on the shore. But the torn-up *Fuci* are seldom carried far from the coast; and, therefore, in earlier times their appearance was the surest indication to the mariner of his approach to land. Yet Columbus was much deceived by them in his first voyage of discovery, when he reached that part of the Atlantic, now known as the Sargasso Sea. In the Atlantic, just within the great equatorial current, is a space of at least 40,000 square miles, in which is always floating on the surface a great mass of seaweed, all of one variety, called *Sargassum vulgare*. Many explanations were given of the origin of this *Fucus*, but it is now ascertained that this is one of the few plants which grow floating freely in the water.

We find then that these weeds are produced in various marine sites—on rocks, at the bottom of the sea, and, as in the case of one weed, on the surface of the sea only; for, like our pond or duckweed, the weed *Sargassum baciferum* has not been found attached, but always floating on the surface of the sea. Seaweeds of different kinds are used as food—of such is the seaweed (*Porphyra ulva*) from which our condiment laver is made. The edible nests made by the Chinese swallows is supposed to be formed out of some gelatinous seaweeds. Other seaweeds are known to us, as carageen, or Irish moss. The fronds of these are composed to a very considerable extent of a substance somewhat like starch, which, when boiled in water, is extracted, and forms a jelly on cooling.

Although seaweeds commonly grow attached to the hardest rocks at different depths of water, their growth is rapid. That of some of the larger seaweeds is recorded by Dr. P. Neil, who reports the facts observed in the course of the erection of a beacon on the Carr Rock, in the Frith of Forth (D. Lamsborough, "British Seaweeds," p. 20). This rock is about 60 feet long by 20 broad, and it is uncovered only at the lowest ebb of spring tides. When the operations were begun, it was clothed with large seaweeds, especially with the great Tangle and the Badderlocks. In the course of 1813 the workmen succeeded in clearing and levelling a considerable portion of the foundation of the intended building; but in November the operations were necessarily abandoned for the winter. At this time the rocks by pick and axe had been made quite bare, the seaweeds had been cut away, roots trampled, and much of the rocks had been chiselled, so that the very stumps had been cleared away. On returning to the rock in 1814, to resume operations, it was a matter of no small surprise to find the rock as completely covered with large seaweeds as when they first landed upon it, though little more than six months had elapsed since they left it quite bare.

Then as to the chemical composition of these plants, seaweed called Tangle was analysed by Hodges. He found, after it had been dried in a temperature of 212 degrees, that it contained

Organic matter.....	66 per cent.
Ash	34 "

The inorganic matter or ash was composed of

Silica	2.7 per cent.
Potash	8.2 "
Soda	23.8 "
Lime	5.2 "
Magnesia	8.5 "
Chlorine.....	11.7 "
Phosphoric acid.....	5.4 "
Sulphuric acid	20.2 "
Carbolic acid.....	12.3 "

Some of the *Fuci* also contain a saccharine substance, which Vanquelin long since showed to possess the characters of mauna.

Another fertiliser, sea-shore sand, is employed in enormous quantities by the farmers of Cornwall and Devon, and this chiefly for the large proportion of finely broken marine shells of which it is composed. The late Professor J. F. Johnston dwelt at considerable length on these fertilising marine sands. He stated, on the authority of "De la Beche's Geological Report of Cornwall," that it has been estimated that seven millions of cubic feet of this calcareous sea-sand are annually employed by the Cornish farmers. He adds (*Quar. Journ. Agri.*, 1843, p. 244): "On the western coast of Scotland, also, and on the shores of the Island of Arran and of the Western Islands, this shell-sand abounds, and is applied extensively, and with remarkable beneficial effects, both to the pasture lands and to the peaty soils that cover so large an area in this remote part of Scotland. It is chiefly along the coasts that it has hitherto been extensively employed, and it is transported by sea to a distance of eighty or one hundred miles. Of the origin of the use as a fertiliser of the calcareous sand of Cornwall we have no account. It seems to have been employed by the Cornish farmers from a very distant period. They were empowered by a grant so long since as the time of Richard, Duke of Cornwall, to carry away this sand free from the payment of any toll to the proprietors of the seashore. This grant was confirmed in the year 1261 by another grant from Henry III., and by the statute of the 7th of James II., c. 18, whose preamble declares this sand 'to be very profitable for the bettering of land, and especially for the increase of corn and tillage within the counties of Cornwall and Devon.' This sand is described by Sir T. D. Lauder (*Trans. High. Soc.*, vol. viii., page 763). He says: 'On examining the sand with a sufficient magnifying power, I found it, as I had anticipated, to be composed of comminuted marine shells, I think I may say, almost devoid of any siliceous mixture. I was a good deal surprised,' he adds, 'to learn that the railway which runs into the heart of the county of Cornwall, branching off in two different directions from Wadebridge, had been entirely conceived, planned, and executed for the inland transportation of this sand for agricultural purposes, and that by means of the railway waggons, and afterwards by that of carts, it was rapidly finding its way over a great part of the county, and producing the most extraordinary effects on the fertility of the surface.' On the coast of France, and especially in Brittany—on the South side of the English Channel opposite to Cornwall—it is obtained in large quantity and is in great demand. It is applied to the clay soils, and to marshy grass-lands with much advantage, and is carried far inland for this purpose. It is there called 'trez,' and is laid on the land at the rate of 10 or 15 tons per acre. On the southern coasts of France it is known by the name of 'tanque' or 'taugne.' The shell-sand of Cornwall," continues Professor Johnston, "contains from 40 to 70 per cent. of carbonate of lime, with an equally variable small admixture of animal matter and of sea-salt. The rest is chiefly siliceous sand." He then gives the analysis of some tanque from the south of France, and of some shell-sand from the Isle of Isla. They were found to contain, per cent.:

	Taugne.	Isla shell-sand.
Sand, chiefly siliceous ...	20.3	—
Alumina—oxide of iron ...	4.6	71.7
Carbonate of lime ...	66.0	28.0
Phosphate of lime ...	—	0.3
Water and loss... ..	9.1	—

There is another fine sand extensively employed by the French farmers—the infusorial sand, which is thus noticed

by the Professor. It is a kind of fine mealy-looking sea-sand, used extensively in Normandy upon the light sandy soils, and which is often carted many miles inland. Mr. Lorimer, of Aberdalgie, in a late excursion along the coast of Normandy, was struck by the preference which was given by the local farmers to this fine meal over the banks of shell-sand which abound also on the coast. He forwarded a specimen to Professor Johnston for examination. It was found to contain :

	Per cent.
Organic matter	5.06
Common salt	1.01
Gypsum	0.32
Chloride of calcium	0.73
Magnesia	a trace
Carbonate of lime... ..	43.50
Alumina... ..	0.17
Oxide of iron	1.20
Oxide of manganese	a trace
Insoluble siliceous matter	47.69

When examined under the microscope, this sand is seen to consist of minute crystals of carbonate of lime, of broken limbs and claws of small crustaceous animals, and of the shells or sheaths of numberless infusoria.

In Normandy it is generally employed in the form of compost, and is extensively mixed with the farmyard manure, which it is said greatly to improve. The practice of the Norman farmers thus referred to we have long seen successfully adopted by the farmers of Suffolk, with the crag of the eastern portion of that county. It is there very commonly used to form the bottoms and the coverings of their dung-heaps, although it does not at first sight appear to be remarkably well adapted for the

purpose. We have remarked the calcareous sea-sand of the north of Devon, employed for a similar purpose, even in localities such as those around Bideford Bay, where, from the steepness of the shore, and other causes, it is usual for the small farmers to bring the sand from the shore in sacks on horses' backs. There is also a peculiar sand collected into barges by dredging scoops near Erith, from the bed of the river Thames, that I have noted to possess peculiar fertilising powers. It is there constantly collected by the crews of a little fleet of vessels, for the use of the builders of the metropolis, and is the siliceous and other sand washed down by the water of the Thames. It possesses a peculiar nauseous putrescent smell, which is probably attributable to the presence of a considerable portion of the mass of organic matters which are poured into the bed of the river from the sewers of the metropolitan districts. The expense of this sand I should think not so great as to preclude its employment on localities convenient for water carriage.

In thus glancing at the seaweeds and sand which the farmers of our western counties employ to such an enormous extent, for what they call "fattening" their land, the suggestion naturally occurs, whether we may not extend their employment to other portions of our island,—whether there are not other masses of shells, deposited in inland districts, like the crag-sand of Suffolk, and the fossil shell-sands of one or two of our midland counties, that might be rendered available, as *permanent* improvers, of certain soils. The employment even of seaweed, although commonly limited to a certain distance from the sea, there is reason to believe might be much farther extended than at the present time,

THE VALUES OF STOCK AND CROP.

The value of our agricultural produce and live stock is necessarily a subject of considerable interest, not only to those more especially identified with this industry, but also to statist and social investigators; and it is too much the custom to depreciate the agricultural interest, because Commerce has become king, and manufactures, in consequence of the cheapness and abundance of the raw material contributed from all parts of the world, are making giant strides. While we are ready to admit the nation's obligations to commerce and manufactures, we still desire to see justice done to agriculture. The area of our insular kingdom it must be remembered is limited, and while the population is increasing at the rate of nearly 1,200 a day, but one-third of this number emigrates. Although the nation has strengthened itself by about four millions in the last twenty years, yet we have at the same time sent out almost as many more millions to our colonies and the United States, where they are multiplying as rapidly as they did at home, and with wider scope for their energies. Man, it has been well observed, creates the materials of his life; and the millions of acres of fertile land in the New World call for hands to gather the varied harvests they yield to modern industry. Grain is brought to our shores and sold at a profit, from countries so remote as California and Australia, by the skill and enterprise of commerce. But it is satisfactory to find that while the value of the merchandise imported in the last ten years has increased 61 per cent, the value of our produce and manufactures exported, has also increased nearly 50 per cent.

Although it cannot be denied that there has been a large increase in our foreign food supplies, this may be

attributed to the improved condition of all classes, the more general distribution of wealth, and the extended competition in shipping, which necessitates their obtaining freights.

QUANTITIES OF THE UNDERMENTIONED ARTICLES OF FOOD IMPORTED INTO THE UNITED KINGDOM.

We published during last year some statistical facts and estimates, calculated to show the aggregate value of agricultural industry, and are induced to return to the subject, in consequence of our figures having been taken up at the late Social Science Congress at Leeds, and it having since been stated that our calculations were excessive, as compared with the data of Mr. Caird, given in the Statistical Society's Journal for June, 1868.

Now, in comparing the two series of calculations, it will be but right again to examine these somewhat in detail.

We will first take Mr. Caird's estimate, premising that it takes in Ireland, whereas our figures related only to Great Britain. We made our calculations upon the agricultural returns of 1869, Mr. Caird's were founded upon those of 1867. These are Mr. Caird's figures:—

Value of the Wheat crop of the United Kingdom	£31,500,000
Oats	25,700,000
Barley	20,400,000
Beans, Peas and Rye	7,000,000
Potatoes	18,000,000
Flax and Hops	2,000,000
Cattle and Dairy Produce	58,500,000
Sheep and Wool	26,900,000
	<hr/>
	£190,000,000

And here are the figures we gave (for Great Britain alone), estimated two years later, be it remembered, and there are of course fluctuations in crops and stock, but in the later year it may be assumed the agricultural returns had got to be more precise and accurate:—

Wheat	£36,875,000
Oats	20,870,000
Barley	19,671,000
Beans and Peas	5,826,000
Hay	40,000,000
Potatoes	8,778,000
Turnips and Root Crops	13,120,000
Flax and Hops	1,898,800
	<hr/>
	£147,038,800

Cattle	79,702,095
Sheep	56,691,746
Pigs	2,413,065
Horses	30,000,000

£315,845,706

Now, reviewing our figures by the additional light of the later returns of agricultural statistics, we will see what modifications require to be made in our estimate. The acreage under wheat, barley and oats has fluctuated very little during the last four years, whatever the crops may have done, and therefore our figures for those may stand; except that we estimated 4 quarters an acre for wheat, for, as we then said a really *good* harvest, and Mr. Caird considers that 28 bushels is the highest estimate that should be allowed. Potatoes may also stand at our estimate, and here we would remark that Mr. Caird omits altogether grass, turnips, and other root crops, which certainly should be taken into consideration as agricultural crops.

We now come to the live stock statistics, and here we are free to admit that our figures require some modification if they are to be considered as the *annual* value of the agricultural produce, for we summed up the value of all the stock returned, although we had stated previously that only about one-fourth were slaughtered. Therefore, the figures should stand thus—

Cattle	£19,925,820
Sheep	12,931,685
Pigs	1,250,000
Horses	30,000,000

£64,107,505

Mr. Caird does not include horses and pigs in his estimate; indeed, he could scarcely do so, for there were no agricultural returns of horses in 1867. But, following his calculations, we have two other items to add to the foregoing—dairy produce and home-grown wool. He estimates the dairy produce from cows in England at £10 per head, in Scotland £8, and in Ireland £7; wool he

takes at about 8s. a head for England and Ireland, and 6s. in Scotland. We have, therefore, to add—

Wool	£11,815,256
Dairy produce	20,858,700
	<hr/>
	£32,673,956

Poultry we pass over.

But to make our comparison fair, we must now add the agricultural statistics of Ireland, which Mr. Caird includes in his figures, and which we did not. These would be as follows, taking also the year 1869, the annual value of Irish agricultural produce—

Grain crops, 2,186,814 acres	£23,248,785
Potatoes, 1,041,837 acres	12,000,000
Beans, Peas, and Rye, 21,156 acres	126,916
Turnips and Beet, 343,009 acres	1,715,000
Meadow and Clover, 1,669,800 acres	8,449,000
Green Crops, 84,051 acres	420,255
Flax, 194,900 acres	2,088,000
Cattle, $\frac{1}{2}$, sold 1,000,000	10,000,000
Dairy Produce	3,293,934
Sheep, 1,100,000	1,650,000
Wool	1,859,263
Pigs, 750,000 at 25s.	937,500
Horses 532,657 at £10	5,326,570

£71,115,223

Now, summarising these foregoing statements, we arrive at the following data. Returns for Great Britain—

Agricultural produce	£147,038,800
Live stock	64,107,505
Dairy produce and wool	32,673,956
Returns for Ireland (as above)	71,115,223

£314,935,484

Now as poultry are not in the estimate, and there are the value of straw and other small matters left out of calculation, we believe we were fully warranted in estimating the annual value of agricultural produce and live stock in the United Kingdom at 301 millions, or fully 100 million more than Mr. Caird's estimate.

PRESENTATION TO MR. JOSEPH MEADOWS.—

It consists of a silver epergne or centre piece with vine branches, bearing foliage and fruit. Around the base are portraits of Bolivar and Charlie, the Thornville prize bulls, from the paintings by D. G. Fortune. The plinth bears the following inscription:—Presented to Joseph Meadows, Esq., Thornville, by his friends, to mark their appreciation of his spirited and successful exertions as a short-horn breeder, and of the credit reflected on Ireland by the fame of the bull "bolivar, and other animals bred at Thornville, exhibited at various leading shows in the United Kingdom." The secretary, Mr. Armstrong, read the following address: Dear sir, on presenting you with a testimonial in recognition of your spirit and enterprise as a shorthorn breeder, allow us to assure you that we take a pride in your success, perseveringly contended for, and honourably won. So long as the annals of the Royal Agricultural Society of England and Ireland are read the fame of the bull Bolivar can never die. As a mark of our respect for your high character in all relations of life, and for the effect your exertions have had in improving the stock of your own neighbourhood, as well as in other parts of Ireland, we request your acceptance of the accompanying gift, and we trust it may descend in your family for generations, to excite them to deeds of usefulness, and as a tribute to the memory of one who had been highly respected and esteemed. Wishing you the enjoyment of all happiness, we are, on behalf of the committee and subscribers, yours faithfully, William Boxwell, treasurer, Samuel Armstrong, secretary. Mr. Meadows expressed his warm appreciation of the honour that had been conferred on him, and felt honest pride in being able to hand down to his descendants such a memorial of the friendship and affection of his fellow-countrymen towards him, which was far beyond his humble deserts,

IMPORTATION OF PEDIGREE SHORT-HORNS.

The demand for this breed seems so greatly on the increase, that our home-herds cannot supply the more valuable tribes. The fact is, that those who possess them are not willing to sell even at inordinate prices; consequently our Colonial brethren and American cousins are applied to, and some animals have recently been purchased and brought over. The importation of the yearling bull, Duke of Hillhurst, for Col. Kingscote, and of the young cow, Eleventh Lady of Oxford, for Lord Dummore, in April last, has just been followed by a still larger importation of three cows and five heifer calves from Mr. Cochrane, for Lord Dummore. The following are the names and particulars:

Duchess 106th, white, calved November 30, 1870, by 8th Duke of York, dam Duchess 103rd by 4th Duke of Thorn-dale.

Duchess 107th, roan, calved December 16, 1870, by 8th Duke of York, dam Duchess 101st by 4th Duke of Thorn-dale.

Eighth Maid of Oxford, roan, calved October 18, 1867, by 2nd Duke of Geneva, dam 2nd Maid of Oxford, by Grand Duke of Oxford.

Marchioness of Oxford, roan, calved January 21, 1871, by 4th Duke of Geneva, dam 8th Maid of Oxford by 2nd Duke of Geneva.

Red Rose, red and white, calved April 12, 1867, by Airdrie, dam Easterday, by Pilot.

Red Rose 2nd, red, calved October 13, 1866, by Duke Frederick, dam Grace, by Airdrie.

Red Rose 3rd, red and a little white, calved February 15 1871, by Joe Johnson, dam Red Rose by Airdrie.

Red Rose 4th, red and a little white, calved July 3, 1871, by 11th Duke of Thorndale, dam Red Rose 2nd, by Duke Frederick.

The two Duchess heifers are the produce of Duchess 101st and Duchess 103rd, which Mr. Cochrane bought in calf last summer, of Capt. Gunter, for 2,500 gs., and the same price is now paid for their calves. Those who have seen and known both dams and calves, are agreed in their opinion that the calves are superior to their dams. Different food, judicious management, and a bracing climate, may even in twelve months have had their effect, and certainly the calves show greater substance and more vigorous constitutions, the white one being especially good, and both are very full of hair. The Oxford cow was bred in America, by Mr. Sheldon, and sold by him to Col. King, from whom she was purchased during Mr. Thornton's visit last winter in America, by Mr. Cochrane. She is a large, strong, nice roan cow, and by a very noted sire, the Second Duke of Geneva, who was said to be one of the finest Duke bulls bred in the States. This cow has a remarkably fine roan heifer calf by Fourth Duke of Geneva, a red prize bull now owned by Mr. S. Campbell.

The Red Roses have been bred in America for nearly thirty years, and are well known here as the Cambridge Rose, or Moss Rose tribe. They are descended from Rose of Sharon, bought by the Ohio Company from Mr. Bates, and the family passed into the possession of Mr. Abram Renick, whose herd of 50 strong is bred entirely from this tribe. They were described by Mr. Thornton as the best and most uniform herd he saw in America. Mr. Renick is an old breeder of great reputation, and his stock, to which he attaches great value, is much esteemed; indeed, most of the bulls that he sells become when exhibited prize winners. It is this family that is reported to have been taken out to America early in the present century, and the first-named cow in the pedigree is

called the American cow. She was, after being several years in America, brought back to England; and Mr. Bates bought her heifer, Red Rose First, by Yarborough. The two cows now imported have two very thick good red-heifer calves running with them. The cows are also deep reds, of great substance, and very symmetrical, having that fine quality and character for which the tribe is noted. The intermediate crosses used in America have always been first-class bulls, chiefly of Bates and Whitaker blood; and of late years Mr. Renick has bred his own bulls by sending his best cows out to Duke sires.

The eight head had some difficulty in being put on board the Sarmatian at Quebec. Mr. Simon Beattie came over in charge of them, and landed them in excellent order. They had a quick but heavy passage, with strong head-winds. On board they stood the journey and ate well, even in the roughest weather, but much was in the care bestowed in the fitting of the boxes. The passengers made quite pets of them on board, and many dainty pieces were put aside for the calves. At Liverpool they were reshipped into a tender, and landed at dark in a cold unprepared dock, where they had to undergo the Government regulations of twelve hours' quarantine. Taking it very quietly, the animals walked in without a bruise or blemish and looked comparatively fresh; but they soon laid down on the somewhat scanty litter that could only be obtained for them. On receiving the veterinary's approval, they were trucked again for Scotland, and arrived at Dunmore on Wednesday night, where his Lordship met them, to his great satisfaction and approval. Indeed, considering the risk and enormous expense, the county is somewhat indebted to a young nobleman, who is not only almost a zealot in the matter of steam cultivation, but who spares neither his time nor his purse in procuring the best animals of the best blood that it is possible to obtain.

Besides these Shorthorns, Mr. Cheney, of Gaddesby, has also imported some Oxford heifers and two bulls from Messrs. Walcot and Campbell's herd at New York Mills, viz.:

10th Lady of Oxford, red, calved March 23, 1867, by 10th Duke of Thorndale, dam Seventh Lady of Oxford by 6th Duke of Thorndale.

13th Lady of Oxford, roan, calved January 21, 1871, by Baron of Oxford, dam Seventh Lady of Oxford by 6th Duke of Thorndale.

9th Maid of Oxford, red and white, calved December 6th, 1869, by 10th Duke of Thorndale, dam 3rd Maid of Oxford by Grand Duke of Oxford.

5th Lord Oxford, red ball, calved August 1, 1870, by 4th Duke of Geneva, dam 2nd Countess of Oxford by 2nd Duke of Geneva.

1st Duke of Oneida, red bull, calved January 2, 1870, by 10th Duke of Thorndale, dam 12th Duchess of Thorndale by 6th Duke of Thorndale.

These animals came over in the ship New York to Southampton. One of the heifers—the Ninth Maid of Oxford, a very beautiful animal—had been exhibited at the New York State Fair, and on the voyage dropped. Although she was landed safely, she died a few days afterwards in the quarantine shed at Southampton. These losses are frequently incurred by those who visit our stocks and export largely, and are the more serious inasmuch as, the animal is invariably of great merit. It is, however, to be hoped that Mr. Cheney's investment with the others will in the end be more fortunate, and in a degree compensate for this loss at the outset.

SHEEP BREEDING AND MANAGEMENT.

BY THE NORTHERN FARMER.

If care has been taken to preserve the pastures moderately rough, the ewes will be able to keep themselves in good condition, without the slightest assistance, until the period of gestation is far advanced; but, however well-conditioned, it is good policy to begin to give a little food in addition to the grass, at least six weeks previous to lambing time. This, besides being favourable to the health of the flock, gives the lambs strength, and they will be dropped strong and hardy, very soon getting the use of their limbs, and the weaklings or culls will be reduced to the smallest possible limit. The food given may consist of the softer varieties of turnips, such as the Pomeranian, grey stone, and yellows, together with a little sweet hay (sheep will eat no other), given in racks so constructed that there will be no waste. A good rack soon pays itself by the mere saving it effects in the consumption of the hay; and no motives of economy, however laudable in other respects, should be permitted to interfere with getting an article for this purpose of the very best construction. The object being to preserve the animals in healthy condition only, fattening foods, such as Swede turnips, cake, or corn, should be carefully avoided until they have lambed, so as to lessen the danger of casualties at that critical period. When fairly started, and the lambing season safely over, bulky food may be given without the slightest danger in as great quantity as the flock will eat, provided it is given regularly. It is in consequence of deviation from this wholesome rule that deaths occur amongst breeding ewes when suckling their lambs, and not from anything injurious in the food itself. Although there is not actually much necessity for it, if bulky food is abundant, a little crushed oats may be given daily, as it to some extent corrects the waterish nature of the grass and turnips, keeps the wool and flesh firm, and in every way aids in preserving the animals in good health.

During the period of lambing no reasonable assistance should be grudged in attending on the ewes both during the day and night, as a little extra care for a few weeks at this time will be paid over and over again by the lives saved, to say nothing of the mental satisfaction which is the invariable accompaniment of success. The feeble little creature newly ushered into the world, it may be on a night of fierce wind or rain, stands but a sorry chance of surviving, unless some friendly hand is near to remove itself and dam to a place of shelter, rendering all necessary assistance until sufficiently strengthened to be able to find the teat easily of itself. Unless constant care of this kind is exercised, a heavy per-centage of the lambs will be lost, many ewes manifesting the greatest indifference to their offspring, if weak or unable to follow. This is more particularly observable in the case of twins, the first dropped being very frequently the strongest and most precocious, and the mother showing the utmost partiality to it, and neglecting the weakling if the latter is not attended to and assisted to suck until it gathers strength.

Highly-bred ewes of the white breeds, even although they may afterwards milk moderately well, are often several days before they come to their milk, the lambs in such cases maintaining only a lingering existence, and losing much of their strength before the mother is able to support them. The shepherd should have milk at com-

mand during the lambing season; and if the position is isolated and the flock large, a cow should be placed at his disposal, so that he should have no reason for being absent from his post. Liberal measures of this kind—viz., plenty of assistance and abundant food—will bring their sure reward at weaning time, the number of lambs in proportion to the ewes being so vastly greater than could possibly be the case under the system of semi-neglect which must inevitably prevail when the shepherd is overworked and unprovided with the necessary aids for the successful carrying out of the extra duties devolving on him at this time.

From the period of lambing until the day of separation the ewes should never want food at will, this rule being of such importance that it cannot be urged too frequently or pointedly. When the food supply is kept up without stint, the flow of milk is uninterrupted. The lambs, having abundance of food, never stop or recede in growth or condition; and on the day when they are turned into cash the extra price per head over other lots not so well cared for, although equally well bred, will be so great as to demonstrate without the slightest chance of mistake or evasion what system pays best—whether liberality or niggardliness.

A mistake is sometimes made by keeping a large number of sheep in one flock, whatever the size of the fields which form their pastures. If the range is large in proportion to the number of stock, the drawbacks attendant on the practice are not so noticeable; but when kept in one lot in small enclosures, there unavoidably follows a considerable amount of inconvenience and positive loss. It pays to have the fields well fenced, so that the flock can be divided into small handy lots, as, in the first place, more stock can be kept, and the sheep are healthier on account of the grass being clean and fresh, a large flock in proportion to the acreage of a field soon rendering it foul, by being thoroughly impregnated with their droppings. Rank grass, forced up quickly from the latter cause, is a fertile source of scour; and much loss from debility, waste of condition, and death is the inevitable consequence when sheep are constantly kept on a limited range, and afforded no variety of food. The paths made by a large number of sheep following each other in succession, which is their invariable habit, become also a cause of loss, much of the land being trodden into pathways, to the utter exclusion of vegetation. For these and various other minor reasons it will be found in practice much more satisfactory to keep a flock of sheep in several small lots, rather than in one large one. In every way they are more handy to manage; and diseases of the feet or skin are much more easily combated, should they unfortunately break out or be introduced to the pastures.

There are two modes of dealing with a flock of sheep now prevalent; the one is to clear off the lambs from the mothers; and the other to hold over, place on turnips, feed liberally with the aid of concentrated food, and sell when from twelve to fifteen months old, either in or out of the wool, as may be found most convenient, the shearing becoming peremptory should the sheep be held until the season is advanced. Both methods have numerous followers, the arguments adduced on each side in support of the favourite theory being nearly always

sound, for the excellent reason that in practice most men find out what pays best, and, adhering to a certain course of management for a number of years, become adepts in that particular branch of husbandry to which their attention has been confined.

To get rid of lambs profitably at the age of from three to five months, the land on which they are bred must necessarily be of good quality, possessing natural advantages in the way of shelter, kindness of soil, and early spring of grass, which, combined with liberality in providing extra food in early spring, make success as nearly as possible a certainty. Feeding off on turnips, on the other hand, can be adopted on a much greater variety of surface, being in point of fact suited to most soils, from the deepest loam to the thin, brashy soil of the moor or hillside scarcely reclaimed from a state of nature, and where, from severity of climate, it becomes absolutely imperative to have the lambs born at the very period when those reared on low-lying and sheltered farms are being converted into cash.

The possibility of bringing waste lands in situations inaccessible to other modes of reclamation into profitable culture, by means of turnips grown with portable manures and fed off with sheep, has made this subject one of national importance, and those men who have devoted their time, capital, and energies to this branch of agriculture, deserve well of their country, and should be considered in the light of its greatest benefactors. Lambs bringing highly remunerative prices from the end of April to beginning of July, the system of clearing out the whole of the season's lambs at that period has been very generally adopted on the better class of soils, the mixed system of husbandry suiting admirably, as by its means, a good bite of succulent grass can be calculated on in very early spring, when confinement to old pastures would be little better than starvation. A farm growing a considerable breadth of green crops every year, can keep a very large stock in proportion to its acreage, every season being amply provided with food. A farmer can scarcely find himself in a worse predicament than that of having more stock than he has food for. Yet, notwithstanding all danger, trouble and loss that constantly occur from overstocking, it is the large number that is most profitable. If a farm is kept understocked, so as to avoid all trouble or outlay, in providing extra food in the spring months, when vegetation is parched into dormancy by sharp frosts and chilling winds, the stock having to subsist altogether on the rough grass which was rejected in the season of plenty, it must be very good land indeed that will make capital so expended a profitable investment. Rent, taxes, and attendance run up an unavoidable bill, which will consume all the profit yielded by a light stock, leaving not even the narrowest margin for interest of money, depreciation of market value, or losses from accident and disease. My own experience is altogether in favour of a heavy stock in proportion to the acreage, it alone on the general run of farms will pay, but it cannot be sustained, unless the supply of food is abundant every day throughout the year. The grass land on a farm worked on a six or seven year's course, has not time to become poisoned by the excretions of sheep, however great the number kept, therefore when a heavy stock is kept and liberally fed, the profit is twofold, first on the animals and their produce, and second by the manurial improvement they effect on the soil on which they are fed in such large numbers, and the large quantity of external food which they consume. By the labour-grudging system, but a moderate stock can be kept even on the best land, and they are fully fed only in the height of the grass-growing season, the winter and spring being long and dreary both to the animals and their owner, instead of being the pleasantest and most cheerful period of the

whole year. By growing turnips, mangolds, cabbage, tares, rape and rye in considerable quantity, and securing heavy crops by careful culture and abundant manure, a very large stock of sheep can be profitably held in proportion to the acreage—the number indeed so great as to be seen to be believed or properly understood, the soil is kept constantly improving in stamina and crop-bearing capability, and the man who has the spirit and intelligence to carry out the full feeding system, both with the land he holds and the stock he owns, will seldom fail to place himself in a position of independence. Rather than let the ewes go back in even the slightest degree when suckling their lambs, it is better to purchase a few weeks' supply of food, if there is the slightest prospect of the home-grown running short towards the end of the season. Whatever the expense it will be repaid over and over again, if by its aid the lambs are kept progressing, and not permitted either to stand still or recede. Either of the latter results will inevitably happen if the milk is suddenly shortened in quantity, by the ewes being compelled to trust wholly to the pastures for support, before growth has been sufficiently advanced to yield them a full bite. A dry April and first half of May is a very trying time for the owners of a large breeding flock, unless he has had the foresight to prepare for such an emergency; this done however, he tides over the period of difficulty with perfect ease, and reaps a well-earned reward in the superior condition and consequent high value of his way-going stock.

Adhering to the principle that it is the heavy stock that pays best, it becomes the duty of every farmer following this course to work out the largest possible sum for each individual member of his flock, as constant care, abundant food, and intelligent management will extract. Loss of capital on the disposal of cast ewes should be carefully avoided, as if this is permitted it seriously lowers the year's receipts, and leads to discouragement. With the high prices of late years realised for mutton of all qualities, there is no necessity for selling old ewes anything at all under the price of those purchased to take their place; all that is required to work them up to the same, or even at times greater value, being a little attention in providing suitable food. This is best accomplished by sowing down a few acres of rich land with clovers, grasses, and rape, without a corn crop, netting the sheep on this in autumn, a very few weeks on such succulent food rendering them thick fat without cake, concentrated food, or medicated mixture of any kind whatever. Assuming that the sales of old, and purchases of new ewes balance each other, and that there are no losses, but those arising from the usual casualties inseparable from the management of a large flock, the question naturally arises, What is a good average for a breeding ewe to make during the season? To fully illustrate my ideas on this very interesting question, I shall suppose a farm of 400 acres worked on a sound system of convertible husbandry, on which there is a large dairy stock, a proportionate number of calves, yearlings, and two-year-olds, working and young horses of different ages, and a stock of 200 breeding ewes of a good kind, costing from 50s. to 60s. each, when purchased in September. I shall further suppose that the whole of the season's lambs are cleared off within six months, the first sale being made early in May, sooner if found profitable, and the final clearance made not later than the middle of August. Such a heavy stock cannot be kept without growing root and other green crops on an extensive scale, and I therefore consider that its receipts ought to come as near as is necessary for the end in view, to the highest productive powers of a good sized fairly bred flock, whose progeny, with but a few choice exceptions, is destined for the butcher at a very early period of their existence. Although there may be considerably more births, it may

yet be accounted a very successful issue if 250 lambs are sold from 200 ewes, a certain number always succumbing to curd on the stomach, hair-balls, foxes, and accidental injury. The lambs being dropped early, and properly nourished from birth, will be in the market when the price is at its highest, easily realizing an average price of 32s. each. I am aware that many men do even better than this, but the figure stated is a very fair one, and will not be reached without liberality and care. The ewes largely benefited by abundant food will grow good fleeces, weighing on the round about 6 2-3rds lbs., making at 1s. 6d. a pound, 10s. for each. The total receipts stand thus:

	£	s.	d.
250 Lambs at 32s.	400	0	0
200 Fleeces at 10s.	100	0	0
	<hr/>		
No. of Ewes 200)	500	0	0
	<hr/>		
Average for each ewe	£2	10	0

This I consider an excellent return when a full stock is kept, and I repeat as my firm conviction that it is only the large number worked up to such good condition as to command the highest price of the day when disposed of that will pay.

CHAP MONEY.

At the annual meeting of the Banbury Chamber of Agriculture, the Rev. C. HOLBECK, the chairman, said their business was to consider the circular of the millers and dealers relating to chap money, which was that they proposed to substitute a month's credit or a month's discount, the former being the usual London terms.

Mr. WESTOVER said he gave notice at the last council meeting that he would bring this matter before the chamber. He said they were very much indebted to Mr. Miller for the able manner in which he brought forward the subject, and the efficient way in which he carried it out. He (Mr. Westover) did not stand there as the representative of those gentlemen who sent the circular out, but he had had some conversation with some of them, and it was found to be very difficult to carry out the resolution passed by the Board on that subject. There were two reasons why they should consider the circular. He thought it would be uncourteous to allow the proposal to pass unnoticed, and another thing was that he thought it would be very undignified to allow themselves to slip into their old channel without discussing the proposal. If they found they were beaten let them acknowledge it. The reason they were beaten, if they were beaten, was that they could not carry out the resolution for want of support in the neighbourhood and district. It might have been successful if other places had begun a similar movement when they did; but it was a very difficult thing to refuse dealers custom when they purchased corn in Banbury market, for they had to give it elsewhere. One dealer said a month's credit meant one month beyond the ordinary fortnight. (Mr. SMITH—"That is not London terms.") Another dealer told him that it meant a month from the day when the purchase was made. A month's discount meant 5 per cent. He had also been told that the tradesmen gave the very same discount for cash, but then they could put on their profit after calculating the cost of production, and sell accordingly. But they could not do so, for their price was fixed for them, and they must sell at market value. It was no argument to say that they could give discount the same as tradesmen. Five per cent. for one month would be one penny in the pound. He quoted the following figures as showing the difference between chap money and discount:—

Qrs.	s.	£	Chap Money.	Discount.
20 barley at 35—35			4 0 } Ss.	2 11 } 6s. 3d.
20 „ at 40—40			4 0 }	3 4 }
20 wheat at 42—42			4 0 } Ss.	3 6 } 8s. 2d.
20 „ at 56—56			4 0 }	4 8 }
20 oats at 20—20			4 0 } Ss.	1 8 } 3s. 8d.
20 „ at 24—24			4 0 }	2 0 }

It seemed to him that the more equitable way would be to give discount of 1d. in the pound.

Mr. R. POTTER said he had signed the paper, and he should stick to it.

The CHAIRMAN said that Mr. Simmons had received the following telegram that morning from the Secretary to the Central Chamber: "The Central Chamber can't consider the subject at present, but hopes that you will not abandon the movement until the other chambers which have taken action in the matter have been communicated with."

Mr. BERRIDGE: It seems from that that the question has been taken up.

Mr. HADLAND would be very pleased to support the abolition of chap money if it could be carried out generally. He found that the resolution they had passed was working very impartially and very objectionably. A great many gave chap money, and others did not. Some gave it who signed the paper. He moved "That in the opinion of this meeting the new system with regard to chap money, being only partial, does not work satisfactorily, and therefore we think it right to release from their pledge all who desire it; but if the Central Chamber of Agriculture (from whom we think the proposition ought to emanate) should at any time adopt it, and it is generally carried out, we pledge ourselves to its support."

The motion was not seconded.

Mr. DAVIS said he was one of those stubborn men who refused to give chap money. He had neither given it nor taken it, and he had found no difficulty in it. He had given a month's credit, and he did not intend to give chap money unless it became a general rule in the market. They should not return to the old system, and he suggested the appointment of a committee to meet the millers and see what should be done.

Mr. GARRETT said he had accepted the terms of the millers, and sold some corn and waited a month for the money, and then they wanted chap-money. The present system did not work satisfactorily.

Mr. R. GARDNER said that some of those who signed the circular would not agree to it. The Woolgroves said they had plenty of money of their own to carry on business with, and they did not want a month's credit. The matter was a very difficult one. He had taken his corn to Birmingham market, and had taken chap-money there.

Mr. DUN suggested that pending further proceedings they should take the compromise offered by the corn dealers and merchants.

Mr. BERRIDGE said that would leave them in the same position as they were now. He thought they were in a very small minority in the matter, and unless the principle was acknowledged by the Central and other Chambers throughout the country, he did not think they would do away with custom. They should wait and see what the Central Chamber did.

Mr. WALTON thought the subject was one in which the Chamber had no right to interfere. They should let Banbury market take care of itself; it was quite able to do so. They could not do away with custom in Banbury, and if they did it would give a fictitious rise to the price of corn in Banbury market. There would be a fictitious rise of 2s. on every ten quarters sold in Banbury.

The SECRETARY could not agree with Mr. Walton that the Chamber had no right to take the matter up. The object of such Chambers was to rectify abuses, and chap-money was one.

Mr. RUSLEY moved that the consideration of the question be adjourned, and Mr. Simmons get information what other Chambers are doing in the matter.

Mr. WESTON seconded, and the motion was carried.

Mr. WESTOVER—In the meantime we remain on strike.

THE MANAGEMENT AND BREEDING OF STOCK.

At a meeting of the Breconshire Chamber of Agriculture, the Rev. Garnons Williams, president, in the chair,

The Rev. Canon BEEVER said that he could not do more than give a few suggestions gathered from his own experience, hoping, at the same time, that the flint struck against the steel of their own experience might elicit a spark which would produce a flame, and induce a discussion whereby both would be benefited. In the first instance he thought of speaking on the general management of a farm, but that seemed such a wide subject that he could not do justice to it in a single address. There were, however, one or two remarks he wished to make at that stage, and upon that subject, viz., that during the past few hours he had seen farms as well managed, and with as good stock as he had seen in any part of England. There was, therefore little or nothing to be taught on that point. He had no doubt there were farmers amongst them who took advantage of those things which gave increased production. Of course success depended in the first place upon sufficient capital at command and placed in the soil; and that, backed up by energy, which ensured the land being well ploughed in good time, sown with the best seed, and having the best management, would, under ordinary circumstances, be followed with success. But there was also another matter he wished to put before them, though most of them might know it, and it was in reference to Mr. Lawes' theory about soils. His theory was this: that soils, like men, possessed certain specialities—idiosyncrasies so to speak—that is, special aptitudes for growing different kinds of crops. For instance, he found when speaking to old farmers, who could scarcely read a book, they had learned from practical experience that different soils possessed distinct specialities. On his own land, for example, one field would grow better wheat than another; a second would grow better barley; a third better oats; and a fourth better root crops. Mr. Lawes recognized what experience had shown, and he also went still further and said, supposing a field grew fifteen bushels of wheat per acre without manure, it was possible to make it produce more by the aid of manure; but without manure, and if cultivated, it would always grow fifteen bushels and not less. It was quite possible that the produce might be increased to thirty-five and forty bushels, as was done by high class farming, and different farmers might drop the amount from forty to thirty-five, but they could not reduce it below what might be termed its natural yield, or its natural aptitude. The next field might grow twenty-five bushels, and they could not reduce it below that amount. They might improve it and they might reduce it, but they could not exhaust the soil below a certain yielding power, and between the highest and lowest limit was the scope for good farming. Now he presumed what a young farmer ought to do, and what he would do if he were beginning farming, was to find out on taking a farm from those who had lived on it what special aptitudes the land possessed; and having ascertained that, he should next consider whether he had sufficient capital to work it properly. The rule of a certain landlord was, "Show me your capital and I will let you a farm." For himself he thought a capital of £10 per acre was not too much. But he wished to impress upon them, the extraordinary fact of the aptitude of soils, and said that if a man wished to succeed he had better ascertain the aptitude of the land he was about going to. Then necessarily another important matter was with regard to the breeding and rearing of stock. Mr. Frank Buckland and others had tried to introduce all sorts of birds and cattle into this country from those in which they were climatised, but Mr. Buckland himself had told him that the experiment had proved a failure. And therefore his advice to those commencing farming, and what he himself would follow if he were beginning, was to get the best stock of the neighbourhood in which the farm was situate, and in that respect Mr. Buckland said the farmers of this country had a grand field for improvement. Now supposing he took a farm in that county he should endeavour to become acquainted with the stock kept by the leading farmers, and also the special aptitude of the soil

from those who lived in the neighbourhood of the farm he proposed to take, who necessarily were better acquainted with it, and in that way he should derive very valuable information. He should probably find that the flocks of the county were a special feature, because Breconshire was somewhat noted for its sheep; and certainly, from what he had seen, justly so. His object, therefore, would be, whether on a hill or a lowland farm, to improve the breed of his sheep, so as to make them give better fleeces, more flesh, and possess hardier constitutions. With regard to pigs, they were not a local breed; the different kinds being found everywhere, but he would not go in much for any of them. Horned stock, he observed, appeared to be closely related to the soil; inasmuch as the different breeds were peculiar to their own distinct part of country. He might be wrong, but he believed that if he took pure-bred Herefords and turned them out in the black cattle country, without allowing them to be crossed, they would, after a long term of years—say a hundred—be found to have grown into and have assumed the type of black cattle. Here was an instance: An old friend of his in Carmarthenshire commenced breeding Shorthorns, and for that purpose bought the very best representatives of that type; but the result had been that they had assumed the exact shape and appearance of the black cattle, though certainly they were not of the same colour. He asked him how he accounted for it, and in reply he attributed it simply to the soil, and said he had watched them change gradually until they had assumed the type of the cattle of that county. And, again, if they took Devonshire cattle into the Shorthorn country, and turned them loose for a hundred years, their characteristics would be of Shorthorned stock. However, as he had said, he had nothing to teach them; he should say to a young farmer coming into a fresh country, "Choose the best stock around you." For example, he saw a flock of sheep the day before from which he might choose twenty animals, all of them of the most beautiful type; and having done that, he should endeavour to make his whole flock, by judicious cross-breeding, as perfect as possible. That is, he should fix a certain type for himself, and try to reach it with his entire flock. He instanced that an eminent breeder came to the conclusion that Southdown sheep were not the most profitable, and to make them more so he crossed and re-crossed, always keeping before him a distinct type to attain to. And so again with horses. If they wanted a good breed they must begin by getting a mare of character, as fine as possible in every point, and perfectly sound. He was glad to say they had an excellent breed of horses in that county. But he had seen horses that were not of such an excellent type, and instanced that one to which a prize was awarded at an agricultural meeting he attended had not a single good point about it—at least what he had been taught to consider good points in an animal. It would be useless to try and get a good breed except the animals were good on both sides and even when they had a good male and good female they might be disappointed. At first they might be exceedingly lucky, as several notable breeders had been producing such animals as the Bloomer mare, Stockwell, and King Tom; but he had a friend who had bred a hundred mares who had never managed to breed a good one, yet he was a first-rate judge and went in for horses, but he was not fortunate, and gave it up. Then again there were small breeders, who perhaps with two or three animals made a really good thing out of breeding. Now, what he should recommend the young farmer to do would be to endeavour to purchase from his neighbouring farmers some old female animals of known character; and for sires he should recommend him to go to an eminent breeder and see if he could get hold of something, within his means, known to be the sire of something first-class; and having done that and fortune favoured him, it was more than likely he would be successful. But if he were not successful he could only say that his experience had shown him that there was no certainty whatever in breeding horses. A breeder might have a splendid carriage mare, beautiful to look

at, fine in action, and possessed of great inherited qualities, yet the foal she brought should not be fit to be looked at; whereas, at the same time, a man occupying the next farm might have a famous trotting thing which would produce a foal which at three years old would sell for fifty or sixty guineas. For sires, however, never let them try to use cross-bred animals. They should go in for purity of blood. The Arab, who got rid of everything that was not perfect to his skilled and trained eye, taught them that lesson. The first cross of any animal he knew was always beautiful. For example, the crossing of a Southdown with a Cotswold would produce in the first instance a beautiful animal, but if it was repeated they would agree with him that the result would be disappointing; and he could not do better than repeat that whatever sire they employed it should be a pure-bred one. He next came to the question of how to introduce pure blood; Eminent breeders, went to other breeders, sparing neither time nor expense, until they secured a cow to their own liking, and after four generations breeding in and in they managed to introduce and gain her constitution, at the same time investing her progeny with their own desired type and outward appearance. He had a visit a month ago to an eminent breeder's, where the process of improving stock and obtaining a higher and better type of animal was being carried on, and he advised that during the period of gestation all kinds of stock should be well housed. He did not mean that it was necessary they should be kept in confined buildings, but certainly they ought to be sheltered from the rain, and also to be well fed. One of his neighbours, who was really one of the best sheep-farmers he knew, and who loved it, had had a great mortality amongst his lambs this last season; he believed he had lost one hundred and sixty, whilst he (the speaker) had not lost one. It was not that he paid more attention to his sheep; but the real secret was in what the surgeon said to him, that he had kept his ewes too low. Now that exactly agreed with his own experience, and if they allowed their ewes at a certain season to run on stubble to pick up what they could get, the probabilities would be that they would have a great mortality amongst their lambs; whereas, if they fed them well, the result would be far more satisfactory. His next point was as to rearing the young. With regard to horses, they could not treat them too well; young horses especially required to be fed well, and being so they would repay their owners. If people would only eat horse-flesh it would be, he thought, a great blessing to the country, for the reason that we should not have such prices in the market for butcher's meat if, when they had a spindled-shanked good-for-nothing two-year-old colt, it was sent to be slaughtered. Everybody had a natural love for horses, and if the antipathy to eating them could be got over, the consequences would be that, if all the bad ones were sent to the market, we should have the finest accumulation of horses—because we had the finest breed in the world, that was, he repeated, provided all the screws were killed and eaten. Calves, also, required to be treated well. A friend of his had a splendid lot of Shorthorns, but he had managed to get a miserly bailiff, and the result had been that he had got a lot of pot-bellied calves, not worth 17s. 6d. each; but, if mother and calf had been treated well in all probability they would have been a fine lot of healthy calves, which, when they came to two years old, would well repay the little extra cost incurred by a more liberal management. The late Mr. R. Booth, one of the finest judges of stock, said to him, "What would you have the mother's milk for, but for the calf?" and advocated that the various foods suggested to be given, should be given through the mother, as if so, the calf would possess an increased richness of blood. Regarding pigs, he might make them acquainted with a dodge worth remembering. Most of them knew that if they had a sow which had not enough milk for her litter, and they gave skimmed milk to the little pigs, the chances were a thousand to one that a lot of them would die. But, by mixing Epsom salts in a proper proportion, its prejudicial effects would be prevented. Skim milk made them costive, while the mixing of Epsom salts with it gave it an opposite tendency. He had only one other suggestion to make, and it was that they should go in for a distinct stamp of stock—say like the Suffolk farmers and breeders had done. One eminent breeder of that county got 600 guineas for two cart mares, and why should they not do the same? Then with regard to their sheep they had a distinct type, and it should be their endeavour to improve it in the same way as other breeders had improved their flocks, and

and who now realised high prices for them. He mentioned one farmer who began life as a labourer's son, but who had applied himself to the improvement of stock, commencing in an humble way, until he had derived great profit from it, and was known as one of the most eminent breeders in the country. The Suffolk horses and cattle had become famous because the breeders and farmers in that county had set before themselves a distinct type to attain to, and now their horses and cattle were as much like one another as they could possibly be. They, in Breckonshire, were celebrated for their cart mares as well as their ponies, out of both of which they might make a first-rate thing, and he instanced that he remembered £84 being given for an unbroken three-year-old colt from that county. He advised that in order for the improvement of their cart mares and ponies they should unite towards attaining a distinct type, towards which they should get rid of all the bad three-cornered animals, and only breed from those that were the best of their kind. From what he had seen since he had been in that district, if he had only a hundred of their ewes, such as he could pick from farms of the neighbourhood, and if he had two or three of their cart mares, as well as other stock, he should be as happy as a prince, and he thought he should hardly ever go to bed for looking at them.

The CHAIRMAN had read of a man who had such an extensive knowledge on different subjects that he was termed many-sided, and he thought the same would apply to Canon Beever, who was a very uncommon many-sided man. They saw him that day as a farmer possessed of all the knowledge which modern science had brought to bear upon farming, and yet in addition to that knowledge gained from books he did not despise the old beaten road of experience. Another day they might meet him holding his own amidst the best scholars of the time in academic circles, and another day exercising the duties of his most sacred and responsible office as a clergyman, and again exercising most responsible duties as examining chaplain to one of the Bishops of the Church; and he thought they might very properly learn a lesson from him in that respect. He begged to move a vote of thanks to Canon Beever for his most interesting and instructive lecture, and he would also add that he hoped it would form the basis of one of those interesting books he had been accustomed from time to time to publish, and which a reviewer stated contained a perfect *valet mecum* for the farmer.

Mr. ALEXANDER WOOD seconded the motion. The conclusion, he took it, the lecturer wished to impress upon them was that they should endeavour to improve the stock of the country. He was happy to think that in that county they had several kinds of stock that were peculiar to that county, and he hoped circumstances would not tend to diminish the characteristics which those animals now possessed. At the same time he must say that he noticed a great change was taking place in the county. He observed that many breeders of cattle and horses were becoming cattle dealers, and some of them would say that they preferred the nimble nippence to the slow shilling. Of course, farming was conducted for making money. The farmer occupied his time and employed his capital the same as mercantile men, to make money. He could conceive, considering the facilities now given for the transit of stock, and in consequence of the increased prices for the same, that there was a great temptation to a man who was a breeder to become a dealer in cattle. But there were peculiarities in the county of Brecon that he believed in the long run more money would be made by breeding than cattle jobbing. For example, they had districts in the county that were peculiarly favourable to the breeding and rearing of cattle. The rev. lecturer gave them a very wise suggestion as to the care which should be given to animals. Not being himself a landlord he was afraid to speak, but he considered more attention should be paid to farm buildings. There could be no doubt that in wet seasons, sheep, horned stock, and in fact all animals liked to be covered, and there could also be no doubt that the condition of animals would be greatly improved if in wet weather they could go into places of shelter, and he believed if provided it would be found that all animals would do so. In that county he knew there were many who had employed their capital for that purpose, but he thought it might be still further extended. And he noticed that in Leicestershire, which is a breeding county, huge sheds were very generally erected on farms into which animals could resort, and they did so immediately when

storms came on, and it was found by spreading lime in the sheds that animals affected with the foot-rot were not only entirely cured, but that the disease was prevented from spreading. There was another subject the lecturer dwelt upon, namely, in respect to the horses of that county. He spoke in high terms of the quality which might be obtained at Talgarth Fair, but he was sorry to say he now saw very few of those famous animals for which the fair was formerly celebrated. But he hoped that the time would come when its characteristics would be revived. At the present time, however, there was scarcely a pony ever exhibited for sale that had got any shoulders which they used to see; and he was sorry to say that a great many little things of three years old were exhibited with foals. He regretted to see that because they could not expect constitution if their ponies were made to have young at so early an age, and it must tend to degenerate the character for which the animal was known. He noticed that the ponies of North Wales had a reputation for being strong and as possessing good limbs, and were of great service to the tenant farmers of that part of the principality. In fact those ponies had won so much of a reputation that at one of Mr. Tattersall's sales as much as £80 to £100 were realized for exceptional animals. Now he did not see why they should not have as excellent a breed in South Wales; what they wanted was to get good sires. With regard to farm horses they had, he believed, some very good specimens; and an enormous quantity was required for the works in the county. He maintained that Breconshire cart horses possessed distinct characteristics, and were not only known in the county for their good qualities but far and wide beyond. He understood that a prize had been offered, by Mr. Crawshaw for competition at the next agricultural meeting, and no doubt when it was published there would be many competitors for it. The giving of prizes he believed would tend to the improvement of the breed, and he thought the next show of the county society would be a rather remarkable one.

Mr. OVERTON said that Mr. Crawshaw's prize did not include the animals mentioned by the previous speaker. He himself offered a prize at the last show for that kind of animal, but he was sorry to say there were so few competitors—only one—that he should not continue it.

Mr. DAVID DOWNES said what Canon Beever had remarked respecting their cart horses he could fully bear him out that twenty years ago they had really first-class cart mares. [Canon BEEVER: That is the time to which I refer.] But at the present day he must say that he did not know where to look for one. Why was that? It was because good sires were few and far between, and had it not been for their friend Mr. Williams, who went to Ross and brought back a good entire horse, they would have been worse off still. He agreed that it was essential they should endeavour to get well-bred animals, and improve the breed of those they had. With regard to cattle he might touch more upon them than upon horses, and he could not but say that he quite agreed with the lecturer in respect to keeping the flesh upon the back of the calf. That, indeed, was so important that it should never be lost sight of, for once stint the calf and reduce the flesh gained by its mother's milk, and it would be ruined for life. His advice too was that they should be kept properly housed, but not in too close and badly ventilated buildings. And not only that, it was essential that a farmer should keep a sharp look-out upon his men, and see that his directions were properly carried out. It was all very well to farm for pleasure, but let them show him the man that did not like a little profit as well. There was another point noticed by the lecturer, and one which he thought Breconshire farmers ought to pay a great deal of attention to, and that was in reference to their sheep. The lecturer said that their ewes should be well protected, and they must agree with him that that was very essential, because he was sure if they allowed their ewes to get into weak condition by short feeding during the winter, the lambs they brought in the spring would also be weak and diseased, and the mortality would be greater amongst them than if the ewes had been well attended to and in good condition.

Canon BEEVER understood a prize bull of Sir Joseph Bailey had died; and he asked whether it was their experience with prize cattle that after being forced and then dropped they were liable to disease of the lungs. He understood that prize cattle kept for ten or twelve years and fed and dropped repeatedly were liable to a certain well-known disease, and that it

was the experience of those who kept these animals that when killed their lungs were a mass of corruption.

Mr. DAVID DOWNES said his own experience taught him that that was so. He recollected some three years ago there was a great competition at the Brecon Agricultural Show, and his brother exhibited an aged bull which won a prize, and which for these shows he was in the habit of forcing and then dropping. But he maintained that the flesh was not taken off judiciously: the animal was stinted in its food, and it ought to have been walked every day. But that was not the case. The consequence was that when the animal came into his possession, and after keeping it two years it only got him two calves. When dead, its lungs were quite rotten and full of hard knots of a chalky substance. He attributed it to the fact that, after forcing, the flesh was taken too suddenly off the animal.

Mr. FERRIS, veterinary surgeon, described the disease referred to.

Mr. OVERTON said it had occurred to him that every farmer should consider the important circumstance, when rearing stock, of its aptitude to the particular locality in which he was located. The Shorthorns were peculiar to Yorkshire, and the Herefords to that part of the country; and it really appeared that there was a certain adaptability of those kinds of stock for their own tracts of country, and if either were transferred from its own soil it would not flourish so well. He believed many attempts had been made to introduce Shorthorn stock into Breconshire, but those attempts had not been attended with success. There were a few instances in Monmouthshire where Shorthorns had been introduced, and after being pampered and protected had done tolerably well, but he did not think it would have been so if special and particular attention had not been paid to them. The only conclusion that he had come to was that there were certain kinds of stock adapted for certain localities and climates, and therefore the first object of the farmer should be, wherever he took a farm, to find out the kind of stock calculated to suit, thrive, and flourish on his soil. He knew of no more striking example of that than in respect to the black cattle of Pembroke-shire. He knew that some time ago large droves used to be purchased and sent into the centre of England; but the result had shown that black cattle did not thrive anywhere so well as in their own country. In fact stock, when removed from the eastern coast to the western coast did not thrive, neither did stock removed from the western to the eastern coast, but both succeeded best in their own tracts of country.

Mr. SMITH rather inclined to the opinion that black cattle would do well in that country, and said that in Carmarthenshire he had seen some beautiful black stock. He believed black cattle, if they were done well to, would thrive equally with Herefords and Shorthorns in that county.

The meeting then separated.

HEADS.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I see that in Mr. Corbet's paper on HEADS, he finds fault with the judges at a Smithfield Show for giving a prize to a Highland ox with a bad head. Now, what I want to know is, have they a choice in the matter? At a show of breeding animals, the head is, of course, a matter of very great importance; but in a show of fat cattle, would the judges be allowed to consider anything but the carcase? I ask for information, as I am to be one of the judges at a fat cattle show.

Yours, truly, A. B. C.

HEADS.—Arrangements are being made for an Exhibition, or rather standing collection in St. Petersburg of the heads of all the improved breeds of animals.

MR. J. A. WILLIAMS, OF BAYDON.—Mr. Williams is about to leave Baydon, and his friends propose presenting him with a testimonial in indication of "the respect and esteem in which he is so universally held, and the great interest he has always manifested for the welfare of agriculturists."

THE WENLOCK FARMERS' CLUB.

At the annual dinner, Mr. R. J. More in the chair, COLONEL CORBETT, M.P., said: The Government did not want, of course, to stop the importation of food for the people; and it, therefore, waited till the very last moment before it pulled down the safety flag and prohibited the importation of cattle from infected places, so that some amount of disease would be imported before the importation was put a stop to. If the cattle were killed at the ports of landing that could not occur. He believed there were very wrong ideas in the minds of the consumer upon that subject, that made him press for what they term a free trade in foreign cattle. The consumption of foreign meat was only five per cent. of the whole consumption of the country. The subtle nature of those diseases were such that it was difficult, if not impossible, to tell what loss was created by the importation of diseases by foreign cattle; but he did believe that more than five per cent. of British-grown meat was lost by their importation. There was another class of people who were very hostile to the prevention of the free introduction of foreign cattle. He meant the people at the ports where such cattle were landed, and who pressed their representatives to oppose all restrictions upon it. The more cattle that were imported the more grist was brought to their mill, and they did not care how much disease was imported. He did not by any means wish to stop the importation of foreign cattle absolutely, but he thought they ought to go through a longer quarantine, or be slaughtered at the ports. He had no doubt that would reduce the number of cattle actually imported, but he believed that instead of the consumer being the loser he would be a very great gainer. The tenure of land was a very important question, and it was one that had been very ably discussed at a meeting of the Chamber of Agriculture for the county; but he thought that was not the time or place to enter into a question such as that. Referring to some of the various proposals for settling this question, supposing the State did buy up all the land in the country, and sold it again in lots to people of small means. They heard a good deal now of every man having his own cottage, in "the open." But supposing an artisan, earning £3 a week or so, had a cottage and a few acres of ground. He would not be likely to make it pay, and the result would be that he would let his house and land at a rate which it would pay nobody at, and he would go back to the town, earn his three pounds per week, and become another instance of a non-resident landlord. Then what would it cost the State to buy up all the land? Sir John Lubbock had calculated that it would require £70,000,000 a-year to pay the interest. Mr. John Stuart Mill had said that the State could do as it liked with the land of the country short of absolutely taking it. He urged also that land had a certain specific value, and beyond that all belonged to the State. But why should the public at large have all the benefits of any improvements a farmer might make in his land? If it were so it would effectually put a stop to all future improvements in land. The present system of weights and measures, as applied to corn, was of a very peculiar nature; but there were people who, in endeavouring to improve it, wished to carry out what seemed to him to be a too radical system of alteration. It was true they had the imperial measure, but no one seemed to care much about using it. Everybody seemed to think that weight was the best, but why should we alter our system more than was necessary? Why were we to alter them simply with the view of adapting them to foreign people's weights and measures, with the cents and so on? If they did alter the present system, he thought the ton ought to be taken as the standard of their weights. But he felt sure they would never get any regularity in their weights and measures unless the onus were put upon the buyer instead of the seller. He regretted that there was not so much competition that year as usual. The entries for the best farms had not filled up at all. He thought the special circumstances would account for that. They had had a late harvest, and it had been difficult to get all the necessary work done within the usual time; and no man liked to show his farm without some prospect of his winning.

Mr. A. H. BROWN, M.P., agreed with Col. Corbett that the scheme put forward by Mr. Mill, and to which Col. Corbett had referred, was one that would not hold water, and it could never form the basis of a sound and practical measure of reform. He hoped, however, that that Club and farmers generally, would continue to agitate until the question was satisfactorily settled. The present system of local taxation had been the growth of many years, and was based more upon decisions in the law courts than by any particular Act of Parliament. They had the local burdens of the country put upon houses and land almost exclusively, whereas the imperial burdens of the country were paid by the excise and duties of that sort, and it was admitted that the system should be altered so as to bring the local burdens over a wider area of incidence. There had been some agitation on the question, and a committee of the House of Commons had sat, one in 1869 and one in 1870, and the Government had promised to take the whole subject into consideration. He believed the rating of woods and game would form part of the Government proposal, and there would be a mode laid down for assessing the value of railway stations. Such buildings as they were aware, had no fixed rent, and it was very difficult, therefore, for any Assessment Committee to rate them properly. The Government proposal was to find out the selling value and to make the property pay at the rate of 4 per cent. per annum, as rateable value. All this would draw into the rating net a large proportion of property that at present escaped from it.

The CHAIRMAN said he feared there was a tendency amongst farmers now to think more of speaking before the Central Chamber than of taking parliamentary action. The present month, he had often before observed, when the repeal of the malt-tax was more thought of than now, was the month to endeavour to influence Government by deputations rather than when the session had commenced, and ministerial measures were framed. But one deputation was going to wait on Mr. Gladstone with respect to preventive measures against cattle diseases. Mr. Keary, the report said, had read a paper to combat the view that scarcity of stock was owing to foreign disease. He expected this deputation would be met with official facts which seemed not to be generally known. What he believed was most desirable for the safety of their herds was to put the present restrictions with respect to the importation of foreign cattle in force against cattle imported from Ireland, but this the Irish members were sure to resist. He fancied it would be found that the cattle diseases now prevalent were not imported from abroad so much as was believed. It was stated that of 28,000 cattle imported last week only two were suffering from contagious diseases. At Harwich, where a greater number had been frequently disembarked weekly, only three animals had the foot-and-mouth disease since February. The question of quarantine was a difficult one, for pleuro-pneumonia was proved to be latent for twenty-eight days, so that the quarantine which would be too long for foot-and-mouth disease, which shows itself after six days, will not be long enough for pleuro-pneumonia. There was one point which the Club had often discussed, but one which he felt called upon to say a few words—the old question of the condition of the agricultural labourer. Severe remarks had lately been made by commissioners as to the state of the labourers in some parts of Shropshire, but not, he believed, on the labourers within the radius of the Wenlock Farmers' Club. Sweeping remarks were frequently made on landlords for not building more and better cottages. No one acknowledged the duty imposed on a landlord with respect to his cottages more than he; but he often wished to remind those who make sweeping assertions on the state of the cottages that these remarks tended to the abolition of the law of entail, the remedy advocated by one of the commissioners the other day in the *Times* newspaper. He felt the truth of the remarks made by Mr. Dent, M.P., in the present number of the *Royal Agricultural Society's Journal*, on the conduct of landlords, in an article on the labourer, from which he read an extract. (The effect of the extract was that all praise was due to great landlords for

the excellence to which many of them had brought their cottages; but not less was the merit of those, who having life interests only in land, were denying themselves pleasures to do the utmost they could afford in cottage building, as was done now by nine-tenths of those who had limited estates in land.) One of the commissioners, quoted by Mr. Dent, put the case of the landlords fairly, when he said they were now being called upon to repair the neglect of previous generations. The state of the labourer must be a matter of interest to all who newly came into estates, and one of them, the present Sir B. Leighton, had lately read a paper on the subject, in which the plan he was reported to have advocated was that of giving four acres of land to a labourer who had been thrifty, and had saved money. He would like to know their opinion, as practical men, on such a proposal. He believed they might approve of a quarter of an acre being thus allotted; but, putting aside the difficulty of getting four acres to allot, and the time of the labourer taken up in looking after his own land, he should like to know what labourers with families were likely to save money. He had been asked by the Government Commissioner to write his view of the state of the labourer, and of cottages, in South Shropshire, and he agreed to do it; but on reflection he thought it would be uninteresting to write an account of any one's property. (though his friend Colonel Corbett had done so), and he did not feel himself called on to criticise the estates of his neighbours. The commissioner had stated that farm wages in some parts of Shropshire were 8s. and 9s. He did not say in the district of the Wenlock Farmer's Club, which, he believed, was not visited when severe remarks were made on the state of things in Shropshire. Of course there were perquisites besides, but all interested in the labourer wished to know if it was necessary to pay part of the wages in beer, giving, he believed, an unlimited supply in some cases to make him work. Supposing only this sum, or the full value of his labour be paid in money, what room was there for thrift with a family to maintain out of as many shillings as the members of the family? He would just allude to the question of local taxation, which had been twice discussed in Shropshire, and was, it appeared, to be discussed a third time by their Chamber of Agriculture. The weakness of such discussions he felt lay in the arguments being all one-sided, the fact of land alone paying rates being uppermost in the minds of those who perhaps were interested in land only; but the difficulty of carrying the views generally expressed at such discussions he felt lay in great capitalists, whose fortune was both funded and in land, being indifferent as to which part of their income paid the taxes and which the rates. He would just say that he considered the great agricultural want in Shropshire was a good middle-class school for farmers' sons, such as had been raised in Suffolk, and now was being built by county subscription in Norfolk. He wished to be sure that small farmers' sons would be better educated than the labourers they would employ, and he for one objected to both being educated at the same school. Lastly, he would draw their attention to a proposal made in Gloucestershire and Worcestershire, that Shropshire should join with them and Herefordshire for an agricultural show, not of course to supersede flourishing local societies like those

at Ludlow and Wenlock, but to produce wider competition between four counties.

Mr. RODEN said: As to the question of the importation of foreign stock, he did not believe quarantine would remedy the evil. While the animals were kept penned up upon the water he believed that more disease would be generated. Stamping such diseases out he believed to be practically impossible. It was "the pestilence that walketh in the darkness," and he believed they were in the hands of that Providence Who alone could check the spread of such diseases, and Who alone could give them prosperity.

Mr. KEAREY had already expressed his opinion at meetings of that Club as to the prevalence of disease among stock, and he believed if the restrictions for moving cattle were more stringently put in force they would have less disease among stock than they had at the present moment. Although he did not for one moment mean to say that such diseases were not brought from abroad, he still held to the opinion he had expressed. He must strongly deny that the importation of those diseases was the sole cause of the disease that existed in this country. He recollected pleuro-pneumonia being rife long before cattle were imported free; and he believed that such diseases were epidemic, and epidemic alone. As Mr. Roden had said, he believed it to be quite impossible to prevent the outbreak of such diseases, but he did think that more care should be exercised by farmers who had the disease upon their farms in sending stock to market.

Mr. PREECE (Cressage) said it was all very well to fine farmers for moving the stock off their farms in such cases; but he had been fined for moving cattle from one part of his own farm to another, which, he thought, was rather too hard.

Mr. E. H. DAVIES thought that Mr. More had made a little mistake in what he said of the wages of farm labourers in Shropshire. So far as he knew the wages were 12s. or 16s. per week, and he did not think any were receiving so little as 8s. or 9s. per week. He (Mr. Davies) was always ready to do what he could for the Club; but having a farm of 700 acres to attend to he could not devote so much time to it as he should like.

Mr. MORE said that what he had stated was that he believed the average wages to be about 14s. per week, including perquisites, but that some actually received as little as 8s. or 9s., and he had been told by a man of great experience in South Shropshire that he remembered 7s. per week being paid, and no perquisites whatever. The commissioners had reported that 8s. or 9s. was paid; but he (Mr. More) was glad to find that it astonished members of that Club to hear of such things. If, however, they would read the report of the commissioners they would see that such was the case.

Mr. TREVOR said the chairman had alluded to a speech recently made by Sir Baldwin Leighton. Sir Baldwin recommended that every young man should keep a cow, but his (the speaker's) opinion differed from that. If there were to be cottages for men to keep cows they should be given to the labourers who had lived upon the estate for a number of years and who were getting past their work, and not to young men when they first came upon an estate.

MORAYSHIRE FARMERS' CLUB.

At the Quarterly Dinner, Mr. R. H. Harris, Earnhill, in the chair, and Mr. Ruxton, Inehbroom, Croupier,

The CHAIRMAN said the question for discussion on this occasion was—"On farms having a sufficiency of cottage accommodation for married servants, whether is it better to board the unmarried with them, or keep them in the bothy or kitchen?" That question presupposed a farm with accommodation for a certain number of married people upon it, but not sufficient for the whole of the servants. It also presupposed a proportion of the servants being unmarried, and the question was how should these be kept upon the farm? It was generally customary to have the opinion of the members of the Club in rotation, as they sat, and he therefore called on

Mr. CRICKSHANK (Melf), who said he had houses for his

men-servants, and he kept the boys in the kitchen. His experience led him to believe that they should be kept in the kitchen. He would keep as many married servants as he could, but he would keep the unmarried servants rather in the kitchen than in the bothy.

Mr. COOPER said that Spynie farm, though it had a pretty large and good staff of servants, necessitated the employment, from there not being cottage accommodation, of a number of single men, who lived in a bothy or out-kitchen, specially cared for and kept cleanly. He had no doubt whatever, if a sufficient number of cottages could be got, of the immense advantage they would be to the farmer, alike for comfort, convenience, and profit. He was quite satisfied of that. But still they could not have all the servants married men; and as to the

boarding of the unmarried with the married servants, he had no experience, nor any knowledge. That system had been largely adopted in the south, and his friend Mr. Walker (Leuchars) would be able to give the Club some valuable information regarding it.

Mr. REXTON (Inchbroom) said he had generally had four married servants in houses, and he had a bothy. It was impossible to accommodate them otherwise than in a bothy, not having a sufficient number of cottages. He was not sure that it would be desirable to have a cottage for every male servant on the farm; he would merely say that he was obliged to use the bothy. He never had any experience in the way of boarding the unmarried servants, and he did not know how it would work. On his farm in the county of Danf. he had about an equal number of servants, and he had tried the unmarried men in the bothy and in the farm-kitchen. He continued them in the bothy for ten years, and for the last six or eight years he had them in the kitchen. Both the bothy and kitchen suited very well. He never had the least difficulty, and he really could not say decidedly which was the best.

Mr. WALKER (Leuchars) said that, during his whole lifetime, since he commenced farming in Fife, he had about an equal number of married and unmarried servants. The system in that county was to have a bothy for the unmarried servants alongside of one of the farm-houses. The unmarried men got their $6\frac{1}{2}$ bolls of meal, and a pint of sweet milk from the cows. The wife in the house next to the bothy kept boiling water for them twice-a-day, and the unmarried men made their own supper. The bothy was cleaned out by the wife of the married servant, and everything kept in order. With regard to keeping young men in the farm-kitchen, they found in Fife that that would never do. It prohibited the landlady and her family getting into the kitchen at night. And another thing, it brought young men very much in contact with female servants. With regard to boarding young men with married men, that was out of the question altogether, for it was a well-known fact that, when a ploughman got a wife, he very soon had a sufficient family to fill his fireside, so that there was no room left for lodgers. If a bothy were kept, they could have it clean, and the men comfortable; and that was by far the best way that young men could be kept. He knew very well there was a want of accommodation in Morayshire for married men. It was different in the south; but, as he had said, where there were sufficient houses for married servants, they required all the room for their own families. He thought, if the bothy were well regulated, it was the proper place for single servants to be kept in.

Mr. BLACK (Elgin) said he had no experience at all, but it just occurred to him to say, lest it should not be noticed otherwise, that last year a Commissioner was in the county, making an inquiry on behalf of Government respecting the appointment of females and children in factories, and otherwise. That gentleman made very particular inquiries into the subject. He could not lay his hand upon his report before coming to this meeting, but so far as he could recollect, that report was very decidedly against the system of boarding young men with married servants.

Mr. HAY inquired whether the Commissioner gave any reason for his opinion.

Mr. BLACK said the Commissioner did, but he could not recollect the details of the report.

Mr. M'KESSACK (Kinloss) could not say he had much experience in the management of servants; but he had the half of the complement of servants in cottages, and the other half in the kitchen. There was a woman kept the kitchen clean for them, kept water boiling for them once or twice a day, and prepared potatoes, or whatever they had to get, for supper. The unmarried servants were on their bolls, and he found that system do very well.

Mr. HAY (Trochiehill) said he had no experience whatever of the bothy system. It seemed to him that it was a system that was passing away, and ought to do so. Nearly the whole of his servants had always been in the farm kitchen, except one or two of the principal, who were in houses. What he should like was to increase the house accommodation, to have more married servants, and, if possible, to have the young men boarding with them.

Mr. KAY (Forres) thought that this was a question that one might give an opinion upon, although not immediately engaged in dealing with it practically—the question bearing on the

best plan of accommodating unmarried servants. He thought the most objectionable plan of doing it was to board them in the houses of the married servants. There were very few instances, indeed, in which the farm cottages contained more accommodation than was absolutely necessary for the servant himself and his family. If the family were young, they required the most of the attention and care the mother could give them, without her having to attend to a boarder; while, if the family were grown up, they could receive no beneficial influence from a boarder. The boarding of unmarried servants in the farm kitchen was also very objectionable. Every one knew that their presence there completely excluded the wife and daughters of the farmer from the kitchen. Every one also knew the noise they created, and the kind of talk that went on amongst young men in a farm kitchen. These were his opinions, and they amounted to this—that the best place for an unmarried servant was a well kept bothy, where the men were kept comfortable, their sleeping apartment kept clean, the furnishings and dishes for their food properly cared for, and everything done for them that could be done. They would never be so happy and well pleased as in that position.

Mr. FERGUSON (East Grange) said he was very sorry that the accommodation for married servants on his farm was limited. He would like more houses, and though he did get more of them, he certainly would not approve of young men being boarded with the families of married men. He did not think there was sufficient accommodation in cottages for boarders. His unmarried men were in a bothy, with the exception of one or two in the house. With increased care in keeping the bothies clean, they would be exceedingly comfortable for the servants. The first desideratum was to get a good bothy. He thought it should be ventilated and go abroad that there are some places in the county of Elgin used as bothies that are not fit for human beings to be in. If they could give their married servants a little more and better accommodation, they would be far more comfortable in these bothies than elsewhere. The thing was to get a better bothy system. There were one or two proprietors he could point to who were now building bothies upon an improved system, giving every facility and accommodation to the men in the shape of good cooking apparatus, lavatories, &c., and he thought that should make the servants comfortable. As to living in the farm kitchen, that could not be approved of. It disturbed all their domestic arrangements in a way that is not at all desirable.

Mr. TOP (Ardivot) thought the result of this discussion would simply be to point out the great deficiency of accommodation both for married and unmarried servants that existed in Morayshire. He quite agreed with his friends Mr. Walker and Mr. Mackessack in their mode of keeping farm servants. He had had married and unmarried servants. The unmarried men he would have kept in a bothy. A great deal of the good or evil arising from the bothy system depended very much on the farmer himself. If the bothy was well managed, there need be no difficulty with it at all. He thought they would find very few cases where they would be able to make married servants take in lodgers.

Mr. WALKER (Alyre) said, so far as married servants were concerned, they knew very well, even though they had sufficient accommodation, what they could do with the allowance given them for fire and other purposes. They also knew what the men could afford for the furnishing of their cottages; and that if they had a man for a lodger, he must sit at the same fireside with the family, and entirely do away with the privacy of their home. There could not be anything more objectionable than to force a stranger into a family, whose presence would prevent them from knowing what family comforts are. It was also bad to have unmarried servants in the farm kitchen. However well-behaved and quiet the men may be, it debared the mistress of the house from entering the kitchen when they were there. They had heard often and often again very severe censure passed upon the bothy system, and he was sorry to say it was the exception to see a good bothy. It was impossible that all their servants could be married men, but their young men could not be better employed than living in a bothy, and seeing the different systems of different farms, and at the same time feathering their nests with the view of entering into a cottage. If they put the men into a bothy, they should give them facility for living comfortably and cooking their meat. For four or five years of a young man's career

bothy experience would not be the worst part of his life. He thought the bothy was the proper place where unmarried servants ought to be.

Major CULBARD said there could be no doubt it was a most disagreeable thing to have farm-servants in a kitchen. It must be a discomfort; and what was a discomfort to the farmer, must be a discomfort to the servant who had a family, and who wished to have all the privacy that his house could afford. He thought their friends the farmers ought to provide better bothy accommodation for unmarried servants. These seemed to be no earthly endeavour to make the young men comfortable, by giving them cooking arrangements, and such other things as would make their bothies fit places to live in. He had been in some of these bothies, and he was sure he had seen better dog kennels. He thought if proper accommodation were provided for unmarried men in the bothy, it would be the best way of providing for them. He did not think it was proper to burden married servants with unmarried servants as boarders, because they must feel it as much as the farmers,

who felt extreme discomfort in having them in the farm kitchen.

The CHAIRMAN said he agreed with the two or three gentlemen who had last expressed themselves. Where the farm had sufficient accommodation for married servants it was desirable to employ them; and that the young men should be kept in a bothy. He thought it was a most unfair invasion of the privacy of the domestic circle, which should be respected, whether it were high or low, to thrust any stranger into it. He knew that system existed to a large extent in the south. They were called bondagers there. It was known to be a system of unendurable bondage, and it had a bad effect upon the morals of the servants. How they could say to a married man, that he must take Tom, Dick, or Harry to board in his house, to be with him at his fireside, and to sit at his table at all times, he could not understand. He could not do that himself. It was his individual opinion that, where there were single men, they should be provided with a bothy. The preponderance of the opinion of the Club also appeared to be to the same effect.

THE TAUNTON AGRICULTURAL SOCIETY.

PRIZE LIST.

JUDGES.—STOCK: J. Stratton, Devizes; S. Nicholls, Bristol; J. Gannicott, Ilminster; and T. Potter, Thorverton. ROOTS: — Gibbs, Pitminster; S. Bond, Portland; and — Grabbham, Ilminster.

HORSES.

Thorough or half-bred colt, filly, or gelding, for riding or hunting purposes, four years old.—Prize, £4, J. Joyce, Allercott. Highly commended: R. P. Boyd, Wellington.

Cart gelding or filly, under three years old.—Prize, £4, W. R. Bond, Durston. Highly commended, W. S. Gibbs, Pitminster.

CATTLE.

BREEDING STOCK.

Bull above two years, pure bred, to be kept in the Western Division of Somerset to 1st June, 1872.—First prize, a silver cup, W. Farthing, Stowey Court, Bridgwater (Able); second, £5, W. Farthing.

Bull, pure bred, above ten months and not exceeding two years, to be used in the Western Division of Somerset to the 1st of June, 1872.—First prize, a silver cup, W. Farthing (Master Harry); second, £2, G. Gibbs's, Bishop's Lydeard. Commended: R. Farthing, Farringdon, North Petherton (Sir William).

Cow and offspring, cow above three years, and calf fallen since Nov. 1, 1870.—Prize, a silver cup, J. Davey (Temptress 2nd). Highly commended: G. Gibbs (Myrtle).

Cow above three years, in calf or with calf by her side.—First prize, £5, J. A. Smith, Bradford Peverell; second, J. A. Smith (Daisy). Commended: J. H. Webber, Ashill, Ilminster (Lydia); and J. H. Dunning, Creech St. Michael (Cherry).

Heifer, in calf or with calf by her side, not exceeding three years.—First prize, £5, T. H. Risdon, Washford (Alexandra); second, £2, G. Gibbs. Commended: J. Edwards, Haydon.

Heifer of pure breed, not exceeding two years.—First prize, £4, W. Farthing (Fair Rosamond); second, £2, W. Farthing (Princess Louise). Commended: G. Gibbs; and T. H. Risdon.

Bull above two years, pure bred, to be kept in the Western Division of Somerset to the 1st of June, 1872.—First prize, a silver cup, J. W. Paull, Ilminster; second, £5, J. W. Paull. Highly commended: J. S. Bult, Dodhill, Kingston.

Bull, pure bred, above ten months and not exceeding two years, to be kept in the Western Division of Somerset to the 1st of June, 1872.—First prize, a silver cup, W. H. Hewett, Norton Court (Crown Prince); second, £2, J. S. Bult. Highly commended: J. Edwards (Baron).

Cow and offspring, cow above three years, and calf fallen since 1st of Nov., 1870.—Prize, a piece of plate, J. S. Bult. Highly commended: W. H. Hewett (Miss Maria).

Cow, in calf or with calf by her side, not exceeding three years.—First prize, a piece of plate, W. H. Hewett (Vilot); second, £2, J. S. Bult.

Heifer, in calf or with calf by her side, not exceeding three years.—First prize, £5, W. H. Hewett (Annette 3rd); second, £2, W. H. Hewett (Nelly). Highly commended: W. S. Gibbs, Pitminster (Princess Royal).

Heifer of pure breed, not exceeding two years.—First prize, £4, W. H. Hewett; second, £2, W. H. Hewett.

FAT STOCK.

Ox or steer, above three years.—First prize, £8, R. Welsh, Ilminster; second, £4, W. Farthing.

Steer, under three years.—First prize, £8, J. S. Bult; second, £4, W. H. Hewett. Highly commended: R. Farthing, Farringdon, North Petherton.

Cow above four years, having produced a living calf.—First prize, £3, W. Farthing (Lofty); second, £4, M. Gibbs, Wellington.

Heifer under four years.—First prize, £3, W. Farthing; second, £4, T. H. Risdon, Washford.

SHEEP.

Pen of not more than four-tooth Longwooled breeding ewes.—Prize, £4, R. Farthing.

Pen of not more than four-tooth Shortwooled breeding ewes.—First prize, £4, A. Bond, Huntstile; second, £2, J. Culverwell, Claveshlays. Commended: J. H. Dunning, Creech St. Michael.

Pen of five fat wethers, not exceeding two years.—First prize, £4, H. Farthing; second, £2, T. H. Risdon.

PIGS.

Boar.—First prize, £3, W. H. Hewett; second, £2, T. Taylor, Pool Farm. Commended: T. Taylor.

Breeding sow.—First prize, £3, T. Taylor; second, £2, T. Taylor. Commended: T. H. Risdon.

ROOTS.

Two acres of Swedish turnips, grown in the county of Somerset, and within twenty miles of Taunton.—Prize, a silver cup, R. Davis, Milverton.

One acre of yellow mangold wurtzel, to be grown in the county of Somerset.—Prize, a silver cup, O. Hosegood, Ilminster.

One acre of red mangold wurtzel, to be grown in the county of Somerset.—Prize, a silver cup, F. Bond, White-lackington.

Two acres of common turnips, to be grown in the county of Somerset.—Prize, £5, F. Bond.

Two acres of Swedish turnips.—Prize, A. Bond.

Two acres of Swedish turnips, to be grown in the county of Somerset.—Prize, a silver cup, A. Bond.

THE ABERDEEN GAME CONFERENCE.

The Sub-Committee of the Aberdeen Game Conference have had a meeting to consider Sheriff Thomson's report on the tabulation of proprietors' and tenants' returns. The members present were: The Marquis of Huntly, Col. Innes of Learney, Col. Ross King of Tertowie, Mr. Edmond of Kingswells, Major Ross, Tillycorthie, Mr. M'Combie, M.P., Mr. Campbell, Blairton; Mr. Barclay, and Mr. Copland—Sheriff Thomson presiding. The following is the *interim* report submitted:

The tabulation of answers to queries having now been completed, and an abstract thereof prepared, Sheriff Thomson begs to lay before the joint-committee the following *interim* statement.

I. PROPRIETORS.—196 lists of queries were issued to proprietors; 102 have returned answers. The amount of rental (as per valuation roll) represented by the said 102 proprietors is £215,814; the total rental of land in the county is about £503,000. It will be remembered that no queries were issued to proprietors having less than £500 rental.

Q. I.—The covenants regarding game contained in the leases or general regulations of the estates of the proprietors who have made returns may be classified as follows: 1. General reservation of game to proprietor, with right to hunt and kill, 69; 2. do., and tenants bound to protect game and inform on poachers and trespassers, 12; 3. Game reserved to proprietor and tenant equally, 2; 4. No special covenant or condition regarding game, 16. Two proprietors returned their schedules blank, the land being in their own occupation. Two returned the queries unanswered, and one considers queries Nos. 1. and II. to be injudicious questions, but answers the other queries.

Q. II.—The practice which obtains apart from the regulations of the estates is returned as follows: On 41 estates the tenants are prohibited from killing game and rabbits; on 2 permission is granted to tenants, on application, to kill hares and rabbits on their farms; on 11 all tenants are allowed to kill rabbits; on 29 all tenants are allowed to kill hares and rabbits; on 1 permission is granted to tenants, on written application, to shoot winged game on their farms.

Q. III.—The number of proprietors who state that complaints of alleged injury by game have been made to them is 19; number who state that no complaints have been made, 80.

Q. IV.—The number of complaints where amount of damage was not stated is 20; the number of claims for damage, 3. Amounts of claims are not given. The claims are stated to have been settled by compromise.

Q. V.—The number of proprietors who state that they preserve game is 37; number who state that they do not preserve, 60. The crops adjoining preserves are stated to be protected by killing down in 36 cases; by fencing, in 3 cases; no arrangement for protection, 4 cases.

Q. VI.—On 30 estates the shooting over agricultural lands is returned as let; on 67 estates the shooting is not let; on 1 estate the shooting is stated to be "occasionally" let, and on another "partly" let. The only arrangement mentioned for the protection of agricultural tenants where the shooting is let is killing down the ground game, which is returned for three estates. On certain estates the game tenant is taken bound to prevent any such increase in game as shall injure the agricultural tenant.

2. TENANTS.—The number of lists of queries sent to tenant-farmers was 7,064; the number of answers received and tabulated is 4,578; the number returned blank, parties having removed or ceased to occupy land, &c., 54; the number from Dead Letter Office, 5; the number not returned, 1,427.

Q. I.—Total acreage of arable land possessed by tenants who have made returns, 372,085 acres. *Note.*—The whole arable acreage of the county is 573,554 acres.

Q. II.—Number of farms the game on which is let, 1,165; do. not let, 3,413.

Q. III.—Number of tenants who state that their crops are damaged by game or other wild animals, 3,816; number whose crops are not damaged, 762.

Q. IV.—Animals by which the crops are stated to be injured: Number who say that they are injured by hares, 680; by rabbits, 215; by hares and rabbits, 2,314; by deer and roes, 291; by grouse, 247; by pheasants, 171; by crows, wood-pigeons, or other vermin, 1,342.

Q. V.—The number of tenants who have estimated their annual loss is £2,257; and the total amount of the estimated annual loss is £19,906 14s. The number of tenants who state that they suffer loss, but give no estimate, is 1,549. The estimates vary in amount from a few shillings to £125 per annum.

Q. VI.—In 855 cases the animals are stated to come from adjoining estates; in 1,274 from the tenants' own proprietors' lands; and in 1,585 cases the answers are indefinite.

Q. VII.—The number of tenants who state that they have, within the last five years, complained to their landlord, or some one on his behalf, respecting game or other wild animals, is 846; number who have not complained, 3,239. The great majority of the complaints seem to have been verbal, and in numerous instances made to gamekeepers. In some cases complaints are stated to have been made to the lessees of the shootings.

Q. VIII.—Total amount of claims for damage, £683 12s.; number of tenants who have made claims, 41. Claims disposed as follows: By legal proceedings, 1; by compromise, 10; admitted and paid, 8; unsettled, 22—total, 41. There are one or two cases where the tenants state that claims were made; but the amounts are not stated. In a few other instances claims are said to have been made against lessees of the game, and the damage paid by them.

Q. IX.—Number of tenants who state that the absolute and unrestricted right to kill, either by their own hands or by others employed by them, hares and rabbits on the land they occupy, would enable them sufficiently to protect their interests, 3,106; number who stated that such right would be insufficient, 750; number who state it to be unnecessary, 134.

Numerous suggestions for further tabulation were made, and Lord Huntly proposed, and Mr. Edmond, of Kingswells, seconded, that the report should not be laid before the Conference until it had been ascertained how many of the tenants of the twenty-nine proprietors who say that they give leave to kill hares and rabbits, nevertheless complain that their crops are damaged by hares and rabbits, whether from their own or neighbouring estates. Mr. Barclay moved, and Colonel Innes, of Learney, seconded, that the report be at once submitted to a meeting of the Conference. On a division, five voted for Lord Huntly's motion, and four for Mr. Barclay's. Sheriff Thomson stated that the inquiry would involve a re-examination of the whole schedules, and would necessarily tend to considerable delay. The meeting expressed their sense of the ability and care with which the report had been drawn up. Sheriff Thomson, in returning thanks, said that much of the credit ought to be given to Mr. Fraser, the assessor, without whose assistance the work could not have been so satisfactorily done.

THE CENTRAL CHAMBER OF AGRICULTURE.

A meeting of the Council, consisting of the deputed members from provincial Chambers and of the elected members of the Council, was held on Wednesday in the Smithfield Show week, at the Salisbury Hotel, Sir M. Lopez, M.P., in the chair.

The minutes of the last meeting having been confirmed, and Mr. J. Abel Smith, M.P., having been elected a life member, The TREASURER read the financial statement for the present year, from which it appeared that the total amount of subscriptions received was £370 3s., to which was added a balance from 1870 of £131 3s. 11d., making a total of £501 6s. 11d., and that the disbursements amounted to £151 7s. 11d., leaving a balance in hand of £149 19s.

It was elicited in conversation that the arrears of subscriptions amounted to £169, being £10 in excess of the arrears at the commencement of the year.

The SECRETARY then read the recent correspondence with Mr. Gladstone, in which the Premier expressed his inability to receive a deputation from the Council in reference to cattle diseases during the week of the Smithfield Show, in consequence of his absence from London. The Secretary said that he had written to the gentlemen who were to have formed the deputation, asking them what alternative course they proposed to pursue, but as the answers in no way agreed, he had taken it upon himself to defer any action until the Council assembled.

Mr. HENEAGE moved, "That Mr. Gladstone be requested to receive a deputation from the Central and associated chambers on the afternoon of either the 5th or 6th of February." That would, he observed, probably be about the period of the meeting of Parliament, and he hoped the Council would in this case be more fortunate in their request.

Mr. CALDECOTT seconded the motion.

Mr. JASPER MOORE thought that the deputation should not be confined to cattle diseases, but should also lay before the Prime Minister the views of the Council in reference to the malt-tax and local taxation, and moved an amendment to that effect.

The amendment was seconded.

Mr. BIDDELL deprecated the mixing up of the cattle question with the others as tending to prevent the interview from proving of any value.

Mr. NEILD, Sir G. Jenkinson, and the Chairman expressed their concurrence in this view, and ultimately the amendment was withdrawn; after which the original motion was adopted unanimously.

Mr. J. K. FOWLER expressed his confidence that the Home Cattle Defence Association would cordially unite with the Council in demanding from the Government adequate protection against contagious diseases.

The Report of the Local Taxation Committee was then presented. It was as follows:

Since the last meeting of the Central Council, the Local Taxation Committee have distributed between two and three thousand copies of the Report they then presented. They trust that a perusal of that record of their proceedings during the past session will insure a still larger amount of support to their exertions in the future. Your Committee are gratified to be able to point to several instances in which the urban ratepayers are awakening to their common interest in the removal of the present unjust incidence of Local Taxation. They would especially refer to two large meetings recently held in London, at which their secretary was present. One of these was held at the Cannon-street Hotel, under the presidency of Alderman Lusk, M.P., when the representatives of twenty-one metropolitan parishes were present. This meeting unanimously resolved to support the principles of the Metropolitan Poor Rate League, a body whose objects are very closely allied to those of your Committee, their aims being defined to be the removal of imperial charges from local taxation; the extension of the present area of assessment to property now exempt; and the maintenance of local control over funds raised locally and expended for local objects. The second meeting was held at the Agricultural Hall, Islington, and was presided over by Lord George Hamilton, M.P. Upwards of 1,500 persons attended, and received en-

thusiastically the addresses of the noble chairman, of Mr. McCullagh Torrens, M.P., Captain Warner Dennis, and other gentlemen. A petition to Parliament was unanimously agreed to, praying for a redress of the grievances inflicted on the ratepayers by the present incidence of Local Taxation, and referring specially to the limited area of property on which local rates fall, and the absence of any local control whatever over large portions of the funds now provided by these rates. It is worthy of remark that the various speakers recognised the necessity of the metropolitan ratepayers combining with those in other parts of the country who were now pressing for redress. Mr. Torrens, M.P., especially cautioned the meeting against the too probable attempt of the Government to create a fictitious division of interest between town and country in this matter, and warned them to accept no piecemeal legislation; and he clearly pointed out that if they permitted their opposition to be disarmed, by the omission of the metropolis from the measure brought forward, they would find that the same completely delusive remedies proposed for the rest of the country would be applied to themselves in a subsequent session. In their last Report, your committee undertook to consider very carefully the bill introduced by Sir Charles Adderley last session, which embodied the recommendations of the Sanatory Commission. This they have done the more readily as they have good reason to believe that the Government intend themselves to deal with the consolidation of the laws relating to public health, water supply, and local government. In examining, therefore, the bill before them, your Committee finds that its objects are as follows: 1. To consolidate all existing statutes on sanitary matters. 2. To make all existing provisions and regulations by means of the central authority in all rural as well as urban districts compulsory, whereas they are at present optional and permissive. 3. To enforce certain new recommendations of the Sanatory Commissioners. In introducing this bill, Sir C. Adderley stated "that it contained economy in every one of its provisions," that there was in it "nothing that could increase the expenditure of the country," and that "no new authority and no new officers were created by the bill." With this your Committee regret they cannot agree, and for this reason: Now it is optional with any district whether or not it shall tax itself for these sanitary purposes, while this bill proposes to render it compulsory on all districts to provide the requisite machinery and officials, and to carry out new regulations at the bidding and to the satisfaction of a central authority. Any such measure must necessarily entail increased local rates. Sir Charles Adderley's bill proposes, therefore, new, because compulsory, charges: 1. For objects which will entail expensive machinery and many paid officials. In only a few cases, perhaps, will the expense of electing new boards be incurred; for existing town councils and local boards are made the local authority in urban and existing boards of guardians in rural districts; but in every case the following new officers must be paid out of the rates—a clerk, a treasurer, a surveyor, one or more local inspectors, one or more collectors, one or more medical officers; while none of these can be removed by the local authority, except the clerk, treasurer, and collectors, without the consent of the central authority; and while in the case of the medical officer this consent of the central authority is required not only to his removal, but also to his appointment and to the amount of his salary. II. Further, this bill entails new, because compulsory, charges for the carrying out of: (1) Sanatory regulations such as—the protection of water-courses from sewage pollution (clause 14); the scavenging the surface of streams (clause 147); the management of sewers (clauses 153-154); the regulation of privies, cesspools, drains, ditches, &c. (Cl. 150, &c.); the abatement of nuisances (Cl. 192); the regulation of common lodging houses (Cl. 236); the provision of means of disinfection, of the carriage of infected persons, and the erection of mortuaries (Cl. 286-309). And (2) New Expenses in regard to Water Supply; in the cleansing of Wells (Cl. 115); in the submitting of all plans of new waterworks to the Central Authority (Cl. 121); in the inspection of works in progress, and of all existing reservoirs by the Central Authority (Cl. 124-125); in having all water supplied by them filtered to the satisfaction of the Central Authority (Cl. 134); in remunerating analysis appointed by the Central Authority, wherever the Local Authority supplies water (Cl. 135). Besides these points on which additional expense must arise, your Committee must point to the general tendency of this Bill to increase centralisation. This may be specially observed: (1) In the control reserved to the Central Authority over the removal and even over the

appointment and salary of Local Officers. (2) In the powers of the Central Authority in defining and acting upon a "default" of the Local Authority as in clauses 89-99—a wide door being thus opened for the expenditure of local funds, under the sole control of the Central Authority. (3) In the powers given to the Central Authority to employ the Police as its agents in certain cases (Cl. 100). (4) In the extent of the control reserved to the Central Authority over the Water Supply—reducing in many instances the Local Authority to the mere officer of the Central Power. (5) And lastly in new powers with regard to making of Bye-laws vested in the Central Authority. Also it must be observed that unless a very careful and discriminating use be made of the powers contained in such a Bill, for the subdivision of districts into "*parishes and parts of parishes*," a still further grievance will arise. For various sanitary works are of benefit only to individual properties or to very limited special areas, and it would be unjust in the extreme to levy a common charge for such purposes over areas unaffected by such improvements, or which had already provided them at their own charges. The necessity of a reform and simplification of the laws now existing on all matters connected with the Public Health is admitted by all; but the objections of your Committee to any such legislation as that proposed are mainly these: First, that every such measure as this must materially increase the amount now unfairly levied by rates upon one class and on one description of property only, and that until a thorough revision and readjustment of the present incidence of local taxation takes place, it would not be just or politic to increase these exceptional charges for any purpose or object whatsoever. Second, that such a measure tends to promote increased centralisation, and to supersede the power and discretion of the Local Authority; that all such legislation should be strenuously resisted, and advantage taken of any consolidating measure to obtain such a revision of the relations between Local and Central Authorities, as will perpetuate a sound, vigorous, and healthy system of Local Self Government. Your Committee would also desire to direct attention to the proposals of the Endowed School Commissioners. The removal or diversion of many small endowments throughout the country from the purposes of Elementary Education, would cause a considerable increase, in many instances, of the Rates required for this object, and a further injustice to ratepayers would be inflicted by the augmentation of a charge which is purely national in its character. In conclusion, your Committee would again urge their supporters in the country to lose no opportunity of impressing on their Parliamentary Representatives the paramount claims of the whole system of Local Taxation for a comprehensive revision. They trust that they will manifest their own interest in the question by promoting discussions in every district, by influencing as far as possible the local press in their own localities, by affording increased pecuniary assistance to the efforts of the Committee, and by inducing others who have not yet hitherto contributed to aid a movement the sole object of which is to make every man pay according to his ability to those national purposes from which every man in proportion to his means derives equivalent benefit and corresponding advantages. Your Committee have to acknowledge with many thanks contributions to their funds, received since their last Report.

MASSEY LOPES,
Chairman.

THE CHAIRMAN said before any one moved the adoption of that report he wished to make one or two remarks. A short time ago the local taxation committee promised to analyse Sir Charles Adderley's Bill relating to sanitary matters. They had now performed that duty, and they had found one great and essential difference between that Bill and the report of the Royal Sanitary Commission. In the latter there was a recommendation which seemed to have escaped the observation of Sir Charles; but he hoped it would not escape the observation of the Government when they were considering what measure they should introduce into Parliament. He would read to the meeting that portion of the report of the commission which related especially to the question of the payment of the expenses incurred. The commissioners said: "It is impossible to turn from this division of our subject without one word as to the exclusive incidence of this in common with all other branches of local taxation on real property in entire relief of personalty, and as to the exemption of the property of the Crown from such taxation. With reference to the former of these two points it is admitted that having regard to some of the principal purposes for which a general district rate has been and hereafter will be imposed, its incidence on real property is peculiarly fitting; but as regards others of these purposes it may be fairly questioned whether the expense of benefits so general, should be borne by the taxation exclusively of real property. In dealing with a limited portion of a large

general subject, it does not become us to do more than glance at either of these anomalies, or to suggest with reference to rating for sanitary objects any departure from that which, in the wisdom of Parliament, may be the general law in respect of cognate subjects; but it cannot be otherwise than pertinent to remark that instances are not wanting in which local expenditure and taxation have been largely relieved by grants from the Imperial Exchequer; and thus, though roughly and imperfectly, the public funds arising from other sources than real property have been brought to contribute in aid of burdens in other respects locally imposed on real property alone. There are, for example, State contributions towards certain expenses in connexion with the relief of the poor; for instance, the salaries of the auditors and the poor-house school teachers, and one-half the salaries of the medical officers are paid by the Imperial Treasury, which also contributes largely to the expense of prosecutions and of county and borough police. Large amounts are annually voted from the Consolidated Fund for school buildings and educational purposes—on this principle, that matters of so general concern cannot be left to unaided local efforts, and that as the result of local neglect would be a national mischief, so the prevention of such a result is matter for national interference, and to be purchased in part at the national expense. To the extent at least which these precedents indicate, and until this whole subject may be capable of exhaustive treatment, and the undue incidence of local taxation on real property may be remedied, it seems desirable that the State should aid the local interests in securing efficient sanitary administration. This is a matter of imperial importance, and is also in its turn too likely to be overlooked and neglected if left entirely to local effort, and too likely also when neglected to cause national, and not merely local mischief. In any degree, therefore, in which an amended health law may lead to greater expenditure by an improved system of inspection, by imposing greater medical supervision, and securing further medical aid, by improved registration, and by any other measure not purely or necessarily local in its original effect, it seems expedient and just that the localities should receive assistance from the State." In conclusion the Chairman expressed his hope that Parliament would adopt the principles thus enunciated by the commission.

On the motion of Sir G. Jenkinson the report of the Local Taxation Committee was adopted.

The CHAIRMAN said the next business on the agenda paper was the appointment of a treasurer and a paid secretary for the year 1872; but as a new code of laws was to be proposed, involving those appointments, he had to suggest that the present treasurer and secretary should be requested to act in those capacities until the meeting in February, and this suggestion was adopted.

The SECRETARY then read the annual report of the council.

The following is the Report—that is, merely omitting the advertisements, or puffs more or less direct for certain people or certain properties:

The Central Chamber of Agriculture, as originally projected, was designed to be, not so much a large society in itself, as a nucleus around which might be organized an association of independent Chambers for counties and for districts. This intention has been realized. At the termination of the sixth year of its existence the Central Chamber numbers 196 subscribers, of whom sixteen are life members; but it embraces in association by means of its representative Council ninety-nine Chambers and branch Chambers, having a total constituency of over 18,000 members. Since the last annual meeting the Faringdon Chamber has been dissolved, and the Midland Farmers' Club has withdrawn from association. Five Chambers, however—namely, the West Gloucestershire, and the Knoyle and South Wilts, which have been formed during the year, and the Malton, Ripon, and York Chambers, which were branches of the North Riding Chambers, have united themselves by subscription to the Central Council; while other Chambers have been established or in process of formation. But the most prominent activity has been displayed in the institution of branch Chambers, it having been found impossible in any other way to provide the whole body of members of any large county Chamber with opportunities for the expression of opinion. The most favoured system of organization consists of branches transferring part of their members' subscriptions to the county Chamber, holding meetings immediately in advance of the county meeting, and upon the same subjects, and then appealing by repre-

representatives at the general meeting convened in the county town or other head-quarters of the Chamber. By this and similar arrangements, the principle laid down in a former report is being carried out—namely, that as few of the farmers distributed over a large province can attend at the head-quarters of their society, the society must go to the farmers, or, in other words, it must provide centres near at hand where questions can be discussed and from whence decisions can be forwarded to the collective meetings of the county or district. Thirty-six of such branch Chambers were named in last year's report; this number has now been increased to forty-three. The Devonshire Chamber has four branches or Farmers' Clubs corresponding with it—namely, at Barnstaple, Bideford, Colyton, and Honiton; the Lincolnshire Chamber has organized four branches—at Boston, Brigg, Grantham, and Louth; the Norfolk Chamber is now strengthened by the West Norfolk Chamber at King's Lynn; the North of England Chamber receives representatives from thirteen union districts of Northumberland and parts of the adjacent counties; the Shropshire Chamber is now supported by nine branches—namely, at Ellesmere, Ludlow, Market Drayton, Much Wenlock, Newport, Oswestry, Shifnal, Wellington, and Wem; the Staffordshire Chamber has five branches or district meeting-places—namely, Burton-on-Trent and Tamworth, Lichfield, Newcastle, Uttoxeter, and Wolverhampton; the Warwickshire Chamber is supported by two flourishing branches—at Henley-in-Arden and Shipton-on-Stour; and the North Riding of Yorkshire Chamber has five branches—namely, Maltby, Pickering, Ryedale, Scarborough, and Whitby. The Council call upon agriculturists in Bedfordshire, Buckinghamshire, Derbyshire, Huntingdonshire, Lancashire, Oxfordshire, Rutland, Sussex, and a majority of the counties in the principality, in which no Chambers have yet been organized, to consider whether they cannot aid in extending this great movement of combination of the agricultural classes for the promotion and defence of their mutual interests. The present rate of annual contribution from the associated Chambers to the funds of the Central Council amounts to £286, and the contribution from subscription members of the Central Chamber, considering that five life-compositions have been received in 1871, to £230; making the total present rate of income of the Council £516. But, as appears from the financial statement appended to this report, the arrears are very heavy, in spite of the repeated applications made by the Secretary for payment.

In order that the numerous Chambers of Agriculture may exert their full power upon public opinion, and may have due weight assigned to their wishes and decisions by the Legislature and by the Government, it is essential to secure, as far as possible, united and simultaneous action upon all questions brought before them; and this object can be attained only through a central representative body, assembling for mutual counsel and direction, concerting measures in accordance with the views of the Chambers, and concentrating in resolutions and appeals, made to Parliament or to public opinion, the voice of the great majority of the agriculturists who are members of those Chambers. Accordingly, the Council, having received various resolutions on the subject in October, 1870, appointed a committee in December to consider and suggest what changes should be made in the rules; and at the meeting on April 4 in the present year this committee reported in favour of admitting deputed members of provincial Chambers to be members of the Central Chamber, and thus to have a voice in the framing or alteration of rules, in favour of regulating the voting power of each Chamber in proportion to the number of its members and its money contribution to the Central Council, and in favour of allowing to such deputed members a plurality of votes in order that the larger or more remote Chambers may be able to exercise their due influence in the decisions of the Council. In fact, the Committee, with no little labour, prepared an altogether new code of laws which were submitted to all the Chambers; and, after discussion on May 3rd, and again on November 7th, the new Constitution and Laws of Association, with sundry amendments, were adopted by the Council and recommended to be passed at the annual meeting this day. The Council would add their recommendation that the new bye-laws should provide for the holding of Council meetings, as heretofore, on the first Tuesdays in February, March, April, May, June, and November, and on Wednesday in the week of the Smithfield Club Show; and that, in addition to the General Business Committee, there should be appointed a limited Parliamentary Committee.

The Council regard with unmixed satisfaction the successful working of the Local Taxation Committee, which was appointed by the Council in May, 1869, and has reported its proceedings month by month since that date. Under the chairmanship of Sir Massey Lopes, Bart., M.P., with a secretary, and Executive Committee, an office, and a special fund of its own, this Committee has obtained the personal support of eighty-three members of the Legislature, who are now numbered in its ranks; and the efforts which have never been intermitted throughout the year, in the agitation of Local Taxation Reform by petitions to Parliament, by public meetings, the dissemination of printed matter, correspondence

with the courts of quarter sessions, and by other agencies, are recapitulated in the separately-issued report of the Committee, to which the Council would earnestly direct the attention of members. In March the Central Council considered "The present unjust incidence of local taxation, and what further action shall be taken to obtain an entire revision of the same," and passed resolutions declaring that no measure will be regarded as just and satisfactory which continues the exemption of other than real property from contributing to new and national burdens, protesting against the militia barracks and storehouses' clauses of the Army Regulation Bill, and against the payment of election expenses out of county or borough rates, and passing a vote of thanks to Sir Massey Lopes and the 194 members of the House of Commons who supported his motion on local taxation. At an adjourned meeting held on April 20th, the Council, in receiving a report of the Local Taxation Committee upon Mr. Goschen's Local Taxation Bills, accorded a vote of thanks to the Committee, and called upon all provincial Chambers to urge their parliamentary representatives to support the points which had been brought forward in that report; and the Council resolved, in particular—(1) That the Government bills continued the exemption of income arising from personal wealth from contributing to the relief of the poor and other local charges; (2) that the proposed division of rates between landlord and tenant did nothing to relieve owners and occupiers of houses and land of the burdens they complained of; and (3) that the powers to be conferred on the new Government Board would still further restrict local self-government, and increase centralisation and local expenditure. On May 2nd, the Council, after again discussing the "Rating and House Tax," and "Rating and Local Government" Bills, resolved to attach the same effect, and in condemnation of the bills, though admitting that some of the administrative clauses were worthy of consideration, and further called upon members of Parliament and others representing owners and occupiers of real property to take all legitimate means for opposing the Government measure. On June 6th the Council passed a resolution accepting the withdrawal of the Government bills, as an acknowledgement of their failure to meet the requirements of ratepayers, but regretting that the Government had found it impossible to fulfil the promises held forth in the Queen's Speech. The Council also resolved firmly to oppose the clauses in the following bills, which threatened greater burdens on the rates—namely: The Army Regulation Bill, the Elections (Parliamentary and Municipal) Bill, the Further Abolition of Turnpike Tolls Bill, the Pauper Lunatic Discharge and Regulation Bill, the Prison Ministers Bill, the Registration of Voters Bill, and the Corrupt Practices Amendment Bill. The Council record with gratification that the Government Local Taxation Bills were withdrawn, the militia barracks and storehouses clauses were defeated, clause 18 in the Elections Bill was defeated, and clauses 19, 20, and 21 were withdrawn, the Prisons Ministers Bill was withdrawn, and the Registration of Voters Bill (No. 1) and Registration of Voters Bill (No. 2) were both withdrawn. The Committee appointed on November 8th last year to confer with the various Fire Insurance Offices as to the most equitable mode of insuring farming stock reported on February 7th that it had communicated with sixty-two offices in Great Britain; it enumerated the offices which were found to adopt the terms with the "average clause" as agreed upon by the companies associated under the "Tariff," and named six offices which communicated other terms, and in particular the Essex and Suffolk Equitable Insurance Society and the Lynn Town and County Insurance Company, which accept insurances of farm stock without the average clause. The Committee held a conference with representatives of the associated offices, and also with representatives of non-associated offices. The Committee did not object to the average clause being applied to three-fourths of the value of agricultural produce, provided average prices and average crops over a series of years were taken as the basis of the amount on which premium is to be paid. It reported its regret that the representatives of the associated offices unanimously declined to entertain this proposition, which determination renders necessary for the farmer's full protection that he shall take out a new policy year by year, and may also necessitate an additional premium in case of a sudden rise in the value of grain. The Committee were happy to find that other offices are willing to accept insurances upon the terms which it suggested; it recommended farmers in all cases to insure hay, corn, straw, and similar agricultural produce in a separate amount from other property; and urged that it should be the practice of all (as it already is of some) offices to inquire into and decide upon the sufficiency of the amount insured at the time of insuring. The report was adopted, printed, and circulated. The report of the Joint Committee of the Central Council and the International Decimal Association was referred to the Provincial Chambers on October 4th last year, with a request that they would consider and resolve upon it prior to the Council meeting of February, 1871. And at this meeting it was resolved, as on a former occasion, that all agricultural produce except liquids should be sold by weight only, and

that the Council, appreciating the advantages of the recommendations contained in the Report of the Joint Committee (in favour of the "quintal" of 100 kilogrammes, and the compulsory use of the metric weights after a defined period), was of opinion that it is desirable in the first place to introduce instruction in the metric system in public elementary schools. At the February meeting the Council unanimously resolved to urge the Government, when reviewing the general licensing system of the country, to consider the unjust pressure of the Malt Tax upon the growers of barley and upon the labouring classes who are the great consumers of beer. Copies of the resolution were forwarded to the Home Secretary and to the Chancellor of the Exchequer. On May 3rd the Council unanimously resolved that efforts made to secure better and cheaper beer by a modification of the Malt Tax would be impeded by those provisions of the Government Licensing Bill which are designed to create a monopoly adverse to the interests of that large class for whom beer is a necessary beverage. And it was further resolved that the costs to be incurred in administering the Bill ought not to be defrayed from the local rates, but that they may be fairly made a first charge upon the revenue derived from licenses. The Government Bill was ultimately withdrawn. At the February meeting the Council resolved that legal provision is necessary, and ought to be made, for enabling persons interested in occupation roads not being highways to co-operate for the purpose of making, improving, and maintaining such roads at their own charge, and that the subject is of sufficient importance to justify an application to the Government to initiate legislation thereupon in the next Session of Parliament. On March 7th the Council passed a resolution to the effect that, as good roads cheapen commodities, benefit all classes, and secure to the public rights of user practically unlimited, highways should not continue to be a charge on real property only through the poor-rate assessment. On April 14th the Council declared its opinion that the powers conferred upon the surveyors in assessing the property and income tax under Schedules A and B, and also the house duty, are generally exercised in an arbitrary and unjust manner; that those powers give the surveyors of taxes inducements and facilities for making most excessive surcharges for which there are no reasonable grounds, thereby causing annoyance and inconvenience in obliging persons to appeal against such assessments; that the present mode of assessing is very unfair to many parties who make a true and just return, and that, in cases where parties are charged in excess, the expense of appealing should be borne by the person making the charge. On April 15th the Council resolved that none of the bills then before Parliament was sufficient for the purpose of curing the evil of the over-preservation of ground game, but that an Act embodying the principles of the third clause of Mr. McLagan's Bill and the fourth clause of Mr. Lock's Bill, with some modification of the law of trespass, would be satisfactory. And at the June meeting the Secretary was instructed to call the attention of all the Chambers to Sir H. J. Selwin Ibbetson's Bill. On June 6th, after hearing a most able paper read by Dr. J. Rogers, President of the Poor-Law Medical Officers' Association, the Council resolved that the present system of Poor-Law Medical relief is inadequate to the wants of the poorer classes, is unsatisfactory in results, and requires amendment, and that it is expedient to adopt for England and Wales a dispensary system, with a modification of the provisions of the Irish Medical Charities Act. A copy of the resolution was forwarded to the President of the Poor-Law Board. On May 3rd the Council instructed the Secretary to urge all the Associated Chambers to press for the rescinding of the Privy Council Order of April 20th, which permitted cattle from Holland to pass inland to any part of this kingdom after only twelve hours' detention at the place of landing. On various occasions during the year the Secretary addressed letters to the *Times* and other journals, calling public attention to cases of the importation of contagious disease. At the meeting on November 7th, the Council unanimously resolved that the failure of the Contagious Diseases (Amended) Act has demonstrated the necessity for compulsory slaughter or fourteen days' quarantine of all imported foreign animals, as uniformly demanded by the Council; that the Government should make as complete and effectual as possible their present inspection of all cattle and sheep previous to embarkation in Ireland, and of all vessels engaged in conveying animals between Ireland and Great Britain; that Government officers should be appointed to enforce the provisions of the Act with reference to the cleansing and disinfecting of railway trucks, yards, and pens, and the watering and transit of animals on railways in Great Britain and in Ireland; and that, when these objects have been secured, the cattle *cordons* should be removed from the metropolitan district. Copies of these resolutions were forwarded to Mr. Gladstone and to Mr. Forster, and Mr. Gladstone was requested to receive a joint deputation of the Chambers of Agriculture and the Home Field Defence Association during the week of the Smithfield Club Cattle Show. The Council regret that absence from London has prevented Mr. Gladstone being able to accede to this request; and it remains for the meeting this day to determine

what alternative course shall be adopted. The Council congratulated the Chambers upon the increasing interest which has been manifest in the meetings during the year; and in particular they would note the dinner at the City Terminus Hotel, on May 2nd.

On the motion of Mr. D. Long, seconded by Mr. Willson, this report was received and approved.

Mr. GENGE ANDREWS presented the resolutions of the Somersetshire Chamber relating to cattle traffic and to local taxation, as follows:

That the continued importation of cattle disease of foreign origin during 30 years has produced a state of things amongst keepers of cattle which materially interferes with and checks production. That the most stringent, costly, and careful inspection which is practicable has, and must necessarily continue, to fail in discovering latent disease in imported cattle. That the importer, the butcher, and the consumer, and the sanitary state of towns, will benefit by the slaughter of all foreign fat animals in completely enclosed spaces at the ports of debarkation. That this Chamber will use its influence to secure legal and permanent provision for the sale and slaughter of all foreign fat animals within enclosed markets, and the quarantine of lean stock at every port licensed for their admission into Great Britain.

That this Council, in continuing its opposition to the unjust exemption from the poor-rate assessment of income arising from personal property, views with satisfaction the fact that it is already evident that the ratepayers of towns, especially of the metropolises, are beginning to see the monstrous injustice of charging the larger half of a direct tax of £16,000,000 on house property. That committees in connection with the County Association of Ratepayers should be formed in every town, with power to add to their number, and three to be a quorum. That the Honorary Secretary be requested to present these resolutions to the annual meeting of the Central Chamber.

He moved that the cattle disease regulations and local taxation be the subjects discussed at the meeting of the Chamber in February.

Mr. D. LONG seconded the proposal.

Mr. NEILD opposed it on the ground that the local chambers were looking anxiously to the malt-tax being dealt with as the next subject of consideration. He moved, therefore, that the malt-tax be included as the prominent question for discussion in February.

Mr. T. WILLSON seconded the amendment, and said that unless the Chamber took the "bull by the horns" in reference to the malt-tax, it would lose most of the members of the Eastern associations.

Mr. STORER said he was in favour of bringing the cattle traffic regulations before the Legislature as soon as possible. He concurred, therefore, in the motion of Mr. Andrews.

Mr. HENAGE reminded the Chamber that the question of local taxation had been completely thrashed out, and that what they had now to do was simply to let the Government understand that that question, in the opinion of the Chamber, stood in the foremost rank, and that they did not mean to put it on one side merely because ministers had made an attempt to deal with it and failed. Moreover, as stated in the report of the committee, the towns were beginning to move in the matter, and encouraged the hope that the Chamber would receive valuable aid from that quarter. As, then, local taxation had been fully discussed already, and little more was to be said respecting it, the real subject for discussion in February would be the Contagious Diseases (Animals) Act, which stood next in order.

Mr. BIDELETT said that his county (Suffolk) was deeply interested in the malt tax, and was looking for more rigorous and decided action by the Chamber with regard to it. He did not object to the proposal to take Local Taxation and the Contagious Diseases (Animals) Act, as proposed by Mr. Andrews, but he strongly protested against placing the malt tax last, when there would be no time to consider it.

The CHAIRMAN: Then let it be understood that the malt tax will be discussed at the meeting in March.

Mr. FOWERADMITTED that the malt tax was a question of primary importance, but at that moment there were not less than 4,000 sheep at the river side affected with a serious disease, and he hoped it would not be thought that farmers were content to let the cattle-traffic question slumber until February, without taking it then in hand. Let that be the subject for discussion along with the malt tax, both of which would have

to be debated at the very beginning of the session of Parliament. Local taxation might certainly rest until March.

After some further conversation it was arranged that the questions to be set down for February should be, 1. Local taxation; 2. Contagious diseases of animals; 3. The Malt-tax.

The Annual General Meeting of the members of the Chamber then took place, and the Report of the Council was received in order to be circulated.

On the motion of Mr. PELL, M.P., seconded by Mr. D. LONG, Sir M. Hicks Beach, M.P., was unanimously appointed Vice-President for the year 1872, and President for the year 1873.

Sir M. H. BEACH, in accepting the office, said until a few days ago his honour had been totally unexpected by him, and he felt it the more because, owing to the pressure of other engagements, he had been precluded from being anything like a regular attendant at the meetings of the Chamber, though he remembered that he attended them when the society was in its infancy. During his term of office he would do his best to maintain the Chamber's prosperity and influence.

The following were elected members of Council: Sir M. Lopes, M.P., Mariston, Roberough, Devon; Mr. C. Clay, Walton, Wakefield; Mr. T. Duckham, Baysham Court, Ross, Herefordshire; Mr. G. Storer, Thorston Hall, Newark, Nottinghamshire; Sir George S. Jenkinson, Bart., M.P., Eastwood Park, Falfield, Gloucestershire; Mr. H. Neild, The Grange, Worsley, Manchester; Mr. G. Whitaker, Caldwell, Kempsey, Worcester; Rev. E. Smythies, M.A., Hathern Rectory, Loughborough, Leicestershire. These were re-elections of retiring members, with the exception of

Sir M. Lopes and Mr. Storer, who take the places of Mr. W. Gardner, Canterbury, and Mr. J. Ichmsley, Newark.

On the motion of Mr. MUNTZ, seconded by Mr. T. DUCKHAM, it was unanimously resolved that the laws and constitution recommended by the Council be approved and adopted, and come into operation on the 7th of February next, and that the first general meeting of the Chamber under the new constitution be held on that day. It was further agreed that Mr. Muntz, Mr. Clay, Mr. G. Whitaker, Mr. Jones, Mr. Little, and Capt. Craigie be a committee to prepare bye-laws and arrange the details under the new constitution.

Mr. MUNTZ proposed a vote of thanks to the Chairman, Sir M. Lopes, for his services during the past year, which was seconded by Mr. Horley, and carried by acclamation.

Sir M. LOPES could only say in vacating the presidency of the Chamber that he had to thank all and every member for the uniform kindness and courtesy they had shown him on every and all occasions. Their deliberations had been conducted with a degree of order and decorum which might vie with those of the highest assembly in the land. Their discussions had been characterized by a vast deal of ability and great moderation of language and temper, and he was pleased and proud at having had the honour of presiding over the Chamber during the past year. He was glad to find, moreover, that the gentleman who was to succeed him was one more competent than himself for the office, and who he felt sure would maintain its dignity and importance as effectually as any one of his predecessors. In retiring from the chair he assured them that his interest in their questions would in no respect be diminished. He trusted they would continue a great and growing power, prosperous and flourishing, and daily proving that they were a bulwark and mainstay of the agricultural interest of the country.

The proceedings then terminated.

FRENCH PEASANT FARMERS' SEED FUND.

The last general meeting of this Fund was held on Wednesday, December 6, at the Salisbury Hotel, when the final Report relating to the Distribution of the Fund was presented. The attendance was small, it being no doubt understood that the proceedings would be rather of an executive and winding-up than of a deliberative character. Lord Vernon presided.

Mr. BRANDRETH GIBBS, one of the hon. secretaries, read the following report of the Committee:

The last Report of the Executive was presented to the General Committee and the Subscribers on the 23rd of May, after the close of the distribution of spring corn. At that date there remained in the hands of the Committee a balance of £2,098 Hrs. 7d., besides a Swedish Fund entrusted to them by M. Drouyn de Lhuys, amounting to £1,272 19s. 11d. The latter sum was afterwards augmented by further remittances from Sweden to £6,300 2s., and by a Limbourg Subscription amounting to £393 Hrs., while the balance of our own Fund was increased by further subscriptions and the repayment of continental railway charges, partly by the companies and partly by the French Government, until it amounted to upwards of £4,000. The total sum thus available for distribution in the autumn was £10,933 16s. The useful application of this sum occupied the attention of the Executive soon after the last General Meeting. We aid them in this duty, they deputed Captain Delf to visit the districts relieved, for the purpose of reporting on the agricultural and economic effects of the operations of the Fund, in accordance with the authority given by the General Committee at its last meeting. The result of Captain Delf's journey was to demonstrate that the barley, oats, potatoes, vetches, and garden seeds, sent by the Fund had generally produced more abundant crops than the native kinds, but that the wheat had failed in most cases. Various causes have been assigned for this exceptional result. The Committee were constantly urged by the French authorities and agriculturists to send wheat, and nursery wheat being at that time the only variety procurable in large quantities for spring-sowing, it was sent by this Fund; and the same kind was bought largely in England by the French Farmers themselves through the ordinary commercial channels. The wheat was for the most part sown during the month of March, but a little even so late as the beginning of April. Circumstances had in most cases not allowed of the due preparation of the land, and the seed time was succeeded by three months of very unfavourable weather. The latest purchases of wheat made by the Fund were of an-

other description—the April wheat—which yielded a satisfactory crop, and it is interesting to remark that this variety has more affinity with the "Blé de Mars" of the country than any other English kind. The Executive, after consultation with M. Drouyn de Lhuys, resolved, with the approach of the autumn seed-time, to expend the balance remaining in the purchase of English autumn wheat, to be distributed in the first instance to those who had received our spring wheat, in the proportion of one-half the quantity previously given. In consequence of the difficulties of transport the Executive Committee appealed to the authorities of the Northern Railway of France for preferential transport of their grain, and to the Minister of Public Works to use his influence in obtaining this concession. The administration of the Northern Railway once more gave the Committee their valuable assistance by granting preferential transport, and a reduction of 50 per cent. on the cost of conveyance of our consignments; and the French Government showed their appreciation of our work by instructing the Custom House authorities at the various ports of landing to admit our corn free of duty. The principles of distribution having been agreed upon by the Executive, the Mark Lane Committee, through Mr. Pavy, purchased 2,700 quarters of red wheat, and Mr. Odams again undertook the shipping department, with his usual public spirit. The Executive were of opinion that this distribution, being conducted in a time of peace, did not require so numerous a staff of English representatives in France as the spring distribution, which was conducted under the double difficulty created by civil warfare and a hostile occupation of the country. In addition, most of the representatives of the Fund were no longer resident in France, and a new agency was therefore unavoidable in those cases. Fortunately, however, Col. Elphinstone was again able to undertake the distribution in the district of La Beauce, and the Executive therefore forwarded him 800 quarters of wheat for the purpose of giving half-quantities to those who had been disappointed of a wheat crop our spring seed. The districts of the North of France and Paris, including the Departments of the Somme, Aisne, Pas de Calais, Oise, Seine, Seine et Oise, and Seine et Marne, were consolidated into one, and placed under the charge of Mr. H. M. Jenkins, one of their honorary secretaries, who was fortunately able to associate with him Mr. C. B. Pitman, a member of the Paris Committee last spring. The seed corn for these Departments, amounting to 1,550 quarters, was sent via Boulogne, at which port M. Vaillant displayed the same energy in landing and forwarding the corn as he

had previously exhibited. The remaining 350 quarters of wheat were sent to the Departments of the Eure, Eure et Loir, and Seine Inférieure through Captain Delf. To him also the Executive are much indebted for his attention to the home business during Mr. Jenkins's absence in France. An examination of the statement of receipts and expenditure appended to this report will show that there remains an available balance in hand of about £1,000, and the executive recommend that they be authorized to distribute this sum to the most necessitous peasant-farmers in money, or in such other way as may be deemed most advisable.

By order of the Executive Committee,

B. T. BRANDRETH GRINDS, } Honorary
H. M. JENKINS, } Secretaries.
W. H. DELANO, }

The following balance-sheet was laid on the table:—

ABSTRACT OF RECEIPTS AND DISBURSEMENTS TO 30TH NOVEMBER, 1871.

<i>Dr.</i>						
To Subscriptions.—		Received as follows, viz.:				
	£	s.	d.	£	s.	d.
From Mansion House Relief Fund...	13,000	0	0			
" Sundry Contributions.....	29,159	4	7			
" Scotch Farmers' Seed Fund, their proportion of expenses...	45	6	0			
				42,204	10	7
To Foreign Fund.—						
Received from Sweden for distribution.....	6,300	2	0			
Received from Limberg for distribution.....	393	14	0			
				6,693	16	0
To Kingsbury and Co.—						
Allowance on Advertising.....				40	0	0
To amounts refunded by Agents being balance of moneys advanced for expenses at different depôts in France; also refunds for Railway Carriage, and sums received from sale of Corn, Seeds, Sacks, &c.				2,607	6	1
To Amount received on account of Mansion House Relief Fund.....				5	5	0
To interest on Deposit.....				31	6	9
				451,582	4	8

<i>Cr.</i>						
By purchase of Seed and cost of distribution, viz.—						
	£	s.	d.	£	s.	d.
Purchase of Seed	37,911	14	8			
Sacks	1,955	11	9			
Freight and shipping charges on Seed purchased and contributed Agents in respect of expenses of distribution.....	3,525	13	0			
[See amount refunded, per contra.]	4,229	15	0	47,643	14	5
By Expenses of Collection, viz.—						
Advertising	2,276	13	7			
Stationery and Printing	273	11	10			
Postages, Banker's charges, Gratuities, Salaries, and Office expenses	568	19	1			
				3,119	4	0
By Amount paid Mansion House Relief Fund.....				5	5	0
By Balance in hand at London and County Bank.....				814	0	6

* In addition to this balance, a sum of £164 7s. has since been refunded by the Paris Committee, and a further sum of about £230 is still due for wheat resold by the Mark Lane Committee. The total balance is thus about £1,200, and the liabilities may be estimated at £150 to £200.—
H. M. J.

£51,582 4 8

Audited and Passed,

(Signed) QUILTER, BALL, AND Co., Dec. 4th, 1871.

The CHAIRMAN said he did not know whether he might take the smallness of the attendance as an indication that the public generally were satisfied with the manner in which the operations of that Fund had been conducted abroad; but he did know that the occupations of agriculturists in London during that week were so numerous that it was almost impossible to get in any engagement of an unusual character. It was not necessary for him to make many remarks, because previously to the distribution of seed-corn, which took place last

autumn, the reports of the Executive and General Committee, entered fully into the past distribution; but as he might fairly assume that that would be the last general meeting, he could not help alluding briefly to the origin and progress of the Fund. They would remember that it was originated in October last year, through the sagacity of Mr. James Howard, member for Bedford, who was well known to all agriculturists; and that M. Drouyn de Lhuys, who had since rendered great assistance to the Committee, at once recognized the importance of distributing the seed to the necessitous peasant farmers. The question was referred to for the first time in public at a meeting of the Smithfield Club, and shortly afterwards a general meeting of those who were favourable to the scheme was held in that house. In the early part of their operations their progress was very much impeded—he was not complaining of it in any way—by the subscriptions demanded for other objects of more immediate necessity in France; but in progress of time, through the agency of different agricultural bodies, and through the assistance of the press, the general sympathy of the public which was created resulted in a subscription amounting altogether to £51,582, of which £13,000 was contributed by the Lord Mayor's fund, and £6,600, the principal part of which had been raised in Sweden, was entrusted to them by M. Drouyn de Lhuys, than whom, as they all knew, no man was more thoroughly acquainted with the necessities of French agriculture, and who was a person of very grave and thoughtful character. The distribution of seed for the summer benefited nearly 100,000 occupiers of land, of whom about 60,000 were supplied in almost equal proportions from Amiens and Tours, and the remaining 40,000 from Rouen, Paris, and Creil. After the last general meeting the executive committee had a balance in hand of about £10,000, and it was settled that they were to distribute that as far as possible among those who had received wheat which had failed. He might say that, in the distribution of corn in France, it was not to be expected that all the grain would be productive, but they had abundant evidence that in almost every case all, with the exception of the wheat, had succeeded beyond their expectations. That the wheat crop was more or less a failure was due partly to the period for spring sowing having passed before they were able to get the corn to the district, and partly to their want of information as to the quality of the seed which was best adapted to the French climate and soil. He believed that if the English agriculturists had been appealed to as a body they would have recommended their sending the nursery wheat which they did send, and that particular quality was bought as far as possible in the ordinary commercial transactions with France. They would have preferred to send the April wheat, and did send some, but it was not readily procurable in England. It yielded an abundant crop. The committee, feeling it to be incumbent on them to remedy any failure as far as possible, had devoted part of their funds to the distribution of a small amount of money to those who received wheat in the spring and whose crops failed. There was ample information on these points in the report of Captain Delf, and he thought they might claim credit for having given to the public full information respecting their operations, their failings as well as their successes. It had often been said in England that the necessities of the French peasantry were not so great as they were at first supposed to be, and that the recipients of seed had not been as grateful as they might have been expected to be. But he was prepared to give the fullest denial to both these allegations. It was true that the peasant farmers had money, but what was the value of money if they could not buy what they required with it? There was plenty of money, but no corn, and he was sure that in spite of a few failures, not only this generation, but those who would succeed them, would have a kindly feeling to the British agricultural public who rendered them assistance in the time of their need. The committee had abundant means of proving the gratitude, not only of the Government and the local authorities, but of the peasantry, who had presented them with testimonials, and had sent them medals, accompanied by letters, in which, with their usual effusion, they expressed their gratitude. The committee had received five or six medals from different districts in France, and the testimonials would form a large volume. He could not conclude without expressing his deep obligation, as the chairman, to the members of the committee who had served with him, for the industry with which they had devoted them-

selves to their work, the care which they had taken to ascertain to the best of their ability how the difficulties of communication could be overcome, how funds could be raised in England, and how it was possible to cope with fraud. If anything had lightened their labours it was the admirable manner in which their representatives abroad had co-operated with them. They had mainly worked through voluntary agents; and, indeed, where there had been any remuneration the amount was so small that it hardly amounted to payment. They were all of them under great obligation to the German Government for their assistance at the commencement of their operations. They were also indebted to the French Embassy at home, and if he might bring one name into greater prominence than another he should mention Mr. Odams, who had given them the advantage of his wharf and his services entirely free of any expense to the fund. The autumn distribution had been conducted entirely through the agency of Mr. Jenkins, and his colleague, Mr. Pitman. The committee could not possibly have surmounted the difficulties which they had had to encounter, without the valuable and intelligent labours and assistance of Mr. Jenkins. He could not, indeed, refrain from expressing his gratitude to all the honorary secretaries, one of whom (Mr. Brandreth Gibbs) sat next to him. They all took an active part in the operations of the Fund, and contributed aid by which a large amount of money had been saved. It was not without some pain that he parted from the contributors to that work. It was a great national work, and he was confident that it would sow the seeds of goodwill and of amity between the two countries.

Mr. WHITEHEAD, in moving the adoption of the Report, said with one exception, that of the failure of the early wheat, which was to be accounted for by the lateness of the season and the inclemency of the weather, the result of their operations and their effect on the French peasantry had been most satisfactory, and he was quite sure would do much to cement the two countries together.

Mr. CANTRELL, in seconding the motion, said he believed that Report would be exceedingly gratifying to all the subscribers, and he felt certain that it would be so to his neighbours in the Windsor district. He trusted that what had been done had made a lasting impression on the French peasant-farmers, and that future generations would bear in mind the assistance received in the time of distress from English agriculturists.

The motion was then adopted unanimously.

Mr. J. R. ROBINSON said he had been asked to move "That the executive committee be authorized to distribute the balance remaining to the most deserving peasant-farmers in money or in such other way as to them may seem advisable." The executive committee had showed so much judgment in their past proceedings that he was sure all who were interested in the fund would leave this matter in their hands with very great satisfaction. At the risk of falling into the monotony of compliments, unavoidable on that occasion, he must observe that all the information which had come before them through the operations of that fund, as well as that which had reached him from other channels, showed that the utmost care was taken by the Committee, as well as by those who represented them in France, that the distribution should be made to the proper persons and in the proper localities. He was very much struck, having been himself very intimately connected with a similar fund—the Peasant Relief Fund—with the amount of labour given by the Chairman and by Mr. Jenkins. Knowing the immense application involved in a matter of that kind, the multiplicity of details to be attended to, the correspondence involved, generally in another language, often technical and filled with names and references, and including allusions usually very difficult to trace and identify, he could only say that he was amazed that the gentlemen who undertook this work were able to devote the requisite amount of time to it. It must have left them very little leisure; but he was quite sure that at the end of their career there was no part of their lives to which they would look back with more satisfaction.

Mr. CANTRELL, in seconding the motion, said the only doubt he had was as to the proper distribution of the money,

but he thought that might safely be left to the committee, who had conducted this matter so well.

The motion was then put, and agreed to unanimously.

Mr. WELLS moved that the executive committee be authorised to present suitable testimonials to Mr. Jenkins and Mr. Odams in recognition of their valuable services. He took it for granted that it must be left entirely to the executive committee to decide in what form these testimonials should be presented. Neither Mr. Jenkins nor Mr. Odams would like him to say much in their presence with regard to the zealous and self-denying manner in which they had furthered the great object of the Fund; but he could not help remarking that with the onerous duties which devolved upon him as the Secretary of the Royal Agricultural Society, supplemented by those which he had so ably and diligently performed in connection with that Fund, Mr. Jenkins could not of late have had much leisure at his disposal.

Mr. PAVY felt very great pleasure in seconding the motion. He had been brought into closer contact with both those gentlemen than most members of the committee, and could therefore speak more confidently of the great value of their services. Having purchased the corn, it was his duty to hand it over to Mr. Odams for shipment; and he could testify that that gentleman afforded every facility for the fulfilment of the object.

The CHAIRMAN, in putting the resolution, said he did not think it possible to estimate the value of the services of those gentlemen, and he hoped that the meeting would agree, not only in adopting the recommendation of the executive committee, but in thinking that the executive committee were right in making the recommendation, and that they could not do otherwise.

The motion was then unanimously agreed to.

Mr. ODAMS said he was certainly much taken by surprise at the proposition Mr. Wells had made. When he undertook the duty which he had performed with so much satisfaction, he certainly did not for one moment think of such a thing as recognition. He could only say that if it took away one bushel of wheat from any deserving French peasant he should be very sorry. He regretted to say that the authorities had required a certificate from them with the corn that was sent which he thought was rather hard.

Mr. JENKINS expressed his concurrence in the observations of Mr. Odams. They all of them put their shoulder to the wheel as well as they were individually able, and he believed there was very little that they had done within the last twelve months that would not bear fruit in due season. The French peasants had nothing to do with the certificate Mr. Odams had spoken of. It was required by the railway authorities, to justify them in doing what the committee had asked them to do as a particular favour. This being the last meeting of the general committee, he could only express his thanks to the general body of subscribers, and also to his colleagues for their assistance in carrying on this occasionally difficult work. Mr. Robinson, who had had a great deal of experience in a work of a similar kind, had well described the amount of labour which had to be undergone.

Mr. WELLS moved a vote of thanks to the chairman and the executive committee. Having the happiness to have Lord Vernon's friendship, he knew how he had put aside private business and concerns to devote himself to that work, and he believed that the gratitude of the French peasant farmers would always be associated with the name of Vernon.

The motion after being seconded by Mr. KINGSBURY, was carried by acclamation.

The CHAIRMAN in returning thanks, said he had never been associated with a body of gentlemen who had given so disinterestedly and so conscientiously their services in a cause which they knew could not be carried to a successful result without the very closest care and attention. He well knew how much time his colleagues had sacrificed to secure a result which would bring credit to their country. That result was of a kind which he felt confident would bear the closest inspection, and he believed it would last for many years to come (cheers).

The meeting then separated.

THE YORKSHIRE SHOW AT YORK.

The important elements constituting the success of a show are the amount of prizes offered, the number of exhibitors, and the attendance of the public. In all these features the York meeting of this year stands well. First in the list, as first in importance, whether tested by merit or number, come the Shorthorns. Speaking generally, in all the classes there is good competition and high merit. In four classes we have 23 competitors. In class 1, best ox not exceeding 4 years old, Lord Zetland takes the first prize against four competitors, and also the President's cup for best ox in the Shorthorn classes. The competition here was exceedingly close, public opinion in about equal instances going for the second and the third animals. The prize ox is a grand white beast, upstanding and gay looking. He is very large, and true made, being covered evenly with capital beef. On his back he is especially good. He girths nine feet, and weighs we should say 120 stones of 14lbs. dead weight. His thighs are not as good as could be wished; but taking him all in all his whole contour is as near "the thing" as possible. The second is Mr. Pulver's roan ox, commended at Birmingham. He is a very fine Shorthorn with wonderful loins, but is not as heavy as the Zetland ox, while he is deficient forward. He is full of Shorthorn character, and in this competition for Shorthorn oxen only is entitled to second honours, although the third ox, belonging to Mr. Drysdale, Fifeshire, was fancied by many. This is decidedly the fattest animal, and the best butcher beast in the class. He has the same girth as the first-prize ox, but is three inches shorter, and is thicker of lean beef, and very true made. He is, however, rather bare on the back bone, coarse on the rump, and is not true on his top—bending in the middle of his back when he stands. Moreover, he does not look the Shorthorn so much as either of the two animals placed before him; and this is one important consideration in a competition professedly for Shorthorns.

In the second class for best ox not exceeding three years old, we have seven in the field, and here we must say that "another Richmond" was certainly wanted. As a lot the merit was mediocre; and the Yorkshire veteran, Mr. Wiley, wins only because there was not a better animal there, but individual merits of this one as an ox are that he is really a ripe and very fat animal. In character, however, he is more of a cow than a bullock, and his flesh is put on in lumps, as it used to be in Shorthorns of the old school, the mass of fat like a hump on the rump being anything but becoming to an ox. Cut this off, however, and he is still immensely before any other in the class as a ripe Shorthorn. Mr. Taylor's second prize is neat and small, as not quite up to the mark in condition. Mr. Lancaster's third prize ox is a stylish animal, very like making a great one; he is, however, light underneath, and shelly. Mr. MacPherson had a good butcher animal, but no style; and Mr. Paver's ox has no pretensions to be called a Shorthorn or a good animal. The best cow Mr. Willis certainly has in his Birmingham second-prize cow, now nearly 10 years old, and a really fat cow. Still she has her faults. Her beef is not the best kind, and she is very bare on the shoulder, and has lost all her beef underneath. Mr. Cattley's second prize animal has youth on her side, and is better quality of beef than the winner. She is a nice thick cow, but is short of size and style compared with her opponent. Sir W. Trevelyan, Mr. Hutchison, and Mr.

Reid, N.B., have useful animals in this class. For the best heifer, not exceeding four years old, Sir W. C. Trevelyan takes first, Lord Zetland second, and Mr. Robson third, in a class of five animals. The prize heifer is one of the best animals out this year—possibly the best in the yard. She wins the Corporation Plate for best female Shorthorn and Mayor's cup for the best ox, cow, or heifer in the showyard. She was bred by Mr. Stamper. Lord Zetland's three-year-old and ten months heifer takes the second prize, and Mr. Robson the third, with good animals.

In cross-bred animals there were only two classes. For ox not exceeding four-years, the prize went to Sir W. C. Trevelyan's three-year and five months red ox. This is an extraordinary animal, a perfect parallelogram in his outline; his neck, shoulders, and crops are perfectly filled up and level; wide as a barn door between his forelegs, and deep in the chine, he looked the heaviest beast in the yard. He girths, however, 8 feet 9 inches—three inches less than Lord Zetland's prize Shorthorn ox—and is the same length. He takes the Sheriff's prize as the best animal in the cross-breed classes. For the best cow of any age (cross-breed) there were six competitors. Mr. J. P. MacPherson's cow is a capital Shorthorn, if she had not had the black muzzle. Splendid in loin and crop, and of great length, she wins her place, though her flesh is not quite as firm as that of Mr. Reid's second prize. She is very capital, beefy, and a level animal, with the exception of being light of flesh forward. Sir W. C. Trevelyan has a good commended cow, and Mr. Reid also two other good animals in this class.

In the four tenant-farmers' classes the competition was not numerous. Mr. Dickenson, Market Rasen, took first, and Mr. Nelson, Barton Hill, York, second, for Shorthorn ox of any age. Mr. Dickenson's animal also secured the cup for best animal in all the tenant-farmers' classes. Both these beasts were of great size; but Mr. Nelson's had more quality and more merit to our eye. In the cow class the first prize was also Mr. Nelson's. She is a fine-shaped cow of great size, full of flesh, and thick through her. Mr. Webster's second prize is smaller, but very neat and compact; and Mr. Emmerson's third prize is a great good cow, but short of lean flesh. For the best ox, cross-bred, of any age, the property of a tenant-farmer, the first prize was given to Mr. Langdale's white steer, a prime young animal full of quality and good looks. The second went to a big blue-and-white ox, the property of Mr. Emmerson Darlington; he is a huge misshapen lump, and his merits are those of the scale only; in this point only does he beat Mr. Lund's black commended ox. Mr. Lund's ox has capital quality, but is very deficient in his flank. The best cow or heifer, of any other breed or cross, not exceeding 4 years, was Mr. Lund's 2 years and 7 months red Norfolk polled heifer. She is a thick, level mutton in parvo. Mr. Stephenson's second is a great, good cow, which we should call a Shorthorn, but we are assured she is a cross-bred, and eligible to compete in the class. Of the Scotch breeds there were four classes. Mr. Read, N.B., had the best polled ox, and Sir W. C. Trevelyan 2nd; Mr. Reid also took 1st for best polled cow or heifer, and Mr. MacPherson second. Mr. Reid's ox is a fine level animal, even throughout, neck and crop filled up to loin most beautifully, and the shoulder buried in flesh. Better beef cannot be; while in shape he has

no more angularity about him than one of Barclay and Perkins' hogsheds. The cow from the same stock is all this and something more; she is younger, and has a sweetness of character that springs from her sex. We think her well entitled to dispute with Sir W. C. Trevelyan's heifer for the title of Queen of the Show. Mr. Reid's ox took the £20 cup for best Scotch-bred animal. In the horned Highland ox class Lord Harewood took first and second with two good animals. The first prize is beef to the ground—a perfect black cloud. The first and second prize in horned Highland cows Mr. J. Harrison, Skipton, took with a pair of neat animals.

The district prizes for tenant farmers brought out fair competition. For ox of any breed, the first and the York butchers' cup for best animal in the district classes went to Mr. Tasker, Naburn, York, for a large useful plain beast. Mr. Robson, Easingwold, took second with a neat animal of Shorthorn character, not fully fed up. Mr. Lund's 3rd prize beast is big enough, but not level. The district cow class was a very good one. Mr. Kirby, of Wilberforce, York, took first with a fine roan, 3 years and 10 months' heifer, and the 2nd went to a sweet heifer 2 years and 5 months old, full of quality and style, belonging to Messrs. Brogden, Tockwith, York, a Short-horn in everything but name and nose. The 3rd prize was taken by Mr. Tasker, Naburn, with a good Shorthorn cow 6 years old. Long and low, and well filled out, she is a good carcase of Christmas beef.

The Sheep entries were good, except in the class for Leicester wethers under 22 months, in which Mr. F. Riccell, Warton, Pocklington, took the prize without competition with three very good specimens of Yorkshire Leicesters. In the South or other Down wethers, Lord Zealand took 1st and 2nd with two pens of prime fat sheep. They also obtained the cup for the best pen of sheep in the yard. His Lordship had a third pen, which were commended. Capital sheep as these are, we should like to know what kinds of Downs they are? Shropshires they surely are not! Lord Wenlock's Shropshire Downs, though beaten here by carcase weight, are not disgraced, though inferior to the winners in fat on the back. The horned Scotch or mountain wethers and also the cross-breeds were well represented by Mr. Hobson and Mr. Agar, who each took first and second in those classes respectively. Mr. Knowles, of Wetherby, showed some capital pens here: they were, however, a year too young, and will be heard of again. For best sheep of any age Lord Wenlock took first with a two-shear Shropshire Down wether, and second with a one-shear gimmer of the same breed in a competition of seven.

Of the pigs we may premise that, even in Yorkshire the competition has seldom been equalled. In seven classes there were 55 entries. In large-bred pigs Mr. Duckering, Kirton Lindsey, came first, Messrs. Cooper, York, second, and Mr. Mangles, Ripon, third. In pigs of the small breed, exceeding twelve months old, Messrs. Sedgwick, York; Mr. Fall, York; and Mr. G. Hutchinson, York, took the honours in the above order. For best pig (small breed), under twelve months old, Mr. Bramill was placed first, Mr. Duckering second, and Mr. Knowles third. For best pig (middle breed), exceeding twelve months old, Mr. Knowles, Mr. Duckering, and Mr. Barton came in first, second, and third. The best middle-breed pig, under twelve months, was Mr. Ambler's Halifax; Mr. Bramill and Mr. Leaf taking first and second. The best pen of three pork pigs produced great competition, Mr. Snowball, Stockton, York, took first, most deservedly; Mr. Taylor, second; and Mr. Hill, York, third. There were also some commended pens. Extra stock: The first prize went to Mr. Hill, York, and the second to Mr. H. Falkingham, York.

A specialty at this fat show is the exhibition of bulls and boars. In the boar classes, Mr. Blake, York, and Mr. Sedgwick, York, took the first and second in the large breed class; and Mr. Falkingham and Mr. Knowles did the same in the small breed class. On the whole, the pig show has never been surpassed at York. Mr. Duckering's pig of large breed, Mr. Sedgwick's small-bred pig, and Mr. Knowles' middle-bred pig above twelve months, are animals that can scarcely be matched.

The two classes of young bulls produced interesting competitions. For the bull between the age of six and twelve months, eleven animals entered the ring. Major Stapylton's first prize is a very straight calf, and has capital colour and handling. He is most promising, in natural condition, and will train on. Mr. Mause's second prize is a thick handsome fellow. He has evidently been well done by, and is perhaps as good to the eye as he ever will be. Mr. Worsley showed a thick deep calf full of hair, well fleshed, and no mean representative of the Booth blood; and the Hon. Egremont Lascelles sent a pretty calf; he is in store condition, and only wants a chance to grow into something more than common. In the class for bulls between one and two years old, Mr. Thomlinson, Cowthorpe, took first with an animal bred by Capt. Gunter; he has all the handling of the fashionable Wetherby family, but is very wrong in his hoofs. Mr. Linton's yearling bull is a very good second; he is already known as a public animal. Mr. Cattley's third prize bull is a deep-fleshed true made animal, and fit for a prize. There were eight animals in this class, nearly all of whom were worth notice.

The poultry was a great show, numbering 355. Any attempt to describe them, had we time to accomplish such a work, would have been frustrated by the peculiar manner in which they were arranged. Instead of the baskets being placed numerically in the order of the catalogue, they are so mixed up that they cannot be taken as they are entered, and examined consecutively. The rabbits are in wonderful force, 117 lots; and the pigeons may be truly termed marvellous, there being no less than 198 pens of these in "fancy" birds. They were a great feature of the show, and are evidently popular with the young and the fair sex, who remember their usefulness on a recent occasion in mitigating one of the evils of war. The roots were not as good as we expected: but the exhibition of butter was excellent. A fancy design in butter, by Mr. Wihely, Easingwold, is a marvel of execution and design rarely equalled in wood or stone; fruits, leaves, birds, eggs, and animals are represented with a fidelity and truth to nature most admirable; it is a work of art which we certainly did not expect to see produced with such a material as butter.

THE DOUBLE PLOUGH TRIALS AT REEPHAM.—A somewhat stormy correspondence is just now being carried through the Norfolk journals. The Messrs. Howard, of Bedford, say, "If the calculations had been properly worked out at the trials, instead of our plough being placed second, it must have been awarded the first prize, inasmuch as the judges stated they had been guided by the dynamometer and given the prize to the plough of the lightest draught." Whereas, the Stewards, Messrs. W. E. Overman, J. W. Howlett, and Henry Dye say: "Since the trial one of the judges has told us that, independently of the lightness of draught, the L S D plough of Messrs. Hornsby stood first in their estimation, and it was gratifying to them to find that the dynamometrical test confirmed the opinion they already formed." And again, "We wish to add that we feel regret that Messrs. Ransomes, Sims, and Head should attempt to disparage a contest in which every endeavour was used to ensure a correct and satisfactory result, and must express our surprise at the correspondence that has appeared in the papers as having passed between Messrs. Eastons and Anderson and their firm."

THE ROYAL DUBLIN SOCIETY.--WINTER SHOW IN DUBLIN.

In consequence of the prevalence of foot-and-mouth disease, there were no fat cattle exhibited. The show was, therefore, confined chiefly to agricultural produce. The cereals were of good quality, but not more numerous than usual. The root and other green crops, while equal in quality to any yet held, were more numerous than any brought together at any former meeting, which was owing to the magnificent collections brought forward by the first, second, and third class model school farms scattered through Ireland under the Board of National Education, and which occupied upwards of 2,000 superficial feet of staging, taking in the whole surround under the galleries of the central hall. For a few years past the model farm schools had a private show at Glasnevin, after which the collections were exhibited at the Dublin Society, but so huddled together that they created but little interest. This was the first time that the Board submitted the produce of their model farms to the adjudication of the Society's judges, and an arduous duty it was, numerous items in the several collections being fully equal to those staged by private growers, and when the juvenile character of the operations are taken into account it must give a foretaste what may be expected, from the mountain sides to the deep valleys, in the most remote districts, when these well trained agriculturists go home, and become scattered over the country. It was, therefore, a well devised and happy union of two such important bodies as the Royal Agricultural Society, now 140 years old, and the National Board of Education, to join in this exhibition; and show, not only Ireland, but the world, what they are doing in agricultural improvement. There are upwards of 150 model school farms scattered over the country, 50 of which have voluntarily come forward in competition with each other and the central establishment at Glasnevin. Mr. Baldwin, the general superintendent, has long been at work to bring about this union of interests, and has at length succeeded. Amongst the first-class farms, the Albert Model Farm at Glasnevin, takes the chief place, which was unquestionably deserved, but it was hardly fair for the mother establishment to compete with her children. The first and second class schools get but medals at the expense of the Society, but the third class get money prizes, for which the National Board has given in the aggregate fifteen sovereigns.

As usual, the samples exhibited by private growers were of first-class character, both in grain and roots, but the trickery of over-feeding was still apparent in the roots in coarse exteriors, elongated crowns, and hollow hearts. General collections from private growers, heretofore so well contested, have dwindled down to a solitary but very superior one, brought forward by Colonel Tottenham, Woodstock, county Wicklow.

The section for the produce of workhouse farms contained only those from the South Dublin, North Dublin, and Tullamore Unions. Of Irish manufactured tweeds, Martin Mahoney and Brothers were the only exhibitors, but the goods were of first-class material and highly finished.

The show of poultry was the best ever seen in Ireland, consisting of every known improved variety, and with the pigeons numbering over 400 pairs. The entire show was very creditable, and the general arrangement conducted with Mr. Corrigan's usual ability.

PRIZE LIST.

JUDGES.—GREEN CROPS: W. Kelly, Portrane; Dr. Moore, Glasnevin Botanic Gardens; W. J. Goode, C.E., Fingles.—

CEREALS AND PULSE: D. Drummond, Dawson-street; J. Farrell, Capel-street.—BUTTER AND HONEY: W. Jury, College-green; J. Byrne, Kevin-street; B. Murphy, Clare-street.—WOOL: J. Ganly, Usher's-quay; J. F. Dixon, James-street; R. Milner, Queen-street.

CEREALS.

White wheat.—First prize, P. Riall, Old Conne, co. Dublin; second, M. Byrne, Newcastle, co. Wicklow.

Red wheat.—First prize, Capt. Thompson, Hollywoodrath, co. Dublin; second, Lady Whitehead, Graystones, Wicklow.

Barley.—First prize, J. Trim, Newcastle, Wicklow; second, M. Byrne.

White oats.—First prize, J. Trim; second, Captain Thompson.

Black oats.—First prize, Lady Whitehead; second, T. Franks, Malton, Cork.

Beans.—First prize, T. Smith, Leamore, Wicklow; second, Captain Thompson.

Peas.—First prize, Col. Tottenham, Woodstock, Wicklow; second, S. A. Rickards, Gorey, Wexford.

Irish flax seed.—First prize, J. Patton, Glaslough, Monaghan; second, D. Patton, Tyranny, Monaghan.

GREEN CROPS.

Purple kohlrabi.—Prize, T. Smith.

Green kohlrabi.—Lord J. Butler, Drumcondra, Dublin.

Field onions.—Prize, Lord J. Butler.

Potatoes.—First prize, Lord J. Butler; second, M. Byrne.

Long red mangel.—First prize, Lord J. Butler; second, Lord Bunbury, Moyle, Carlow.

Long yellow mangel.—First prize, Lord J. Butler; second, S. Mowbray, Queen's co.

Red globe mangel.—First prize, Lord J. Butler; second, Col. Tottenham.

Yellow globe mangel.—Lord J. Butler; second, S. Mowbray.

Any other variety of mangel.—First prize, Lord J. Butler; second, S. Mowbray.

Cabbage.—First prize, Lord J. Butler; second, Captain Thompson.

Rape.—First prize, S. Mowbray; second, Colonel Tottenham.

Flax (Hempscutched).—First prize, D. Patton; second, J. Patton.

Flax (Millscutched).—First prize, D. Patton; second, J. Patton.

Irish hemp (scutched).—First prize, J. Patton; second, D. Patton.

BUTTER.

Butler in cools.—First prize, D. Patton; second, Miss Jones, Newcastle, Wicklow.

Butter in firkins.—First prize, D. Patton; second, Mrs. Hanlon, Grange Falton, co. Carlow.

GENERAL COLLECTIONS OF FARM PRODUCE.

Private growers.—Prize, Col. Tottenham.

General collections from workhouse farms.—First prize, South Dublin Union; second, North Dublin Union; third, Tullamore Union.

COLLECTIONS FROM THE NATIONAL EDUCATION MODEL FARMS.

First class.—First prize, — Smith, Albert Model Farm, Glasnevin, Dublin; second, J. Kenny, Limeric; third, T. McCabe, Gormanstown, Tipperary; fourth, W. Deane, Munster, Cork; fifth, M. O'Brien, Uster, Belfast.

Second class.—First prize, T. Madden, Woodpole, co. Meath; second, L. Ryan, Garryhill, Fernagh.

Third class.—First prize, S. Groghegan, Whitechurch, Tipperary; second, unknown; third, D. O'Dowd, Doocastle, Sligo; fourth, — Hergaton, Fivemiletown; fifth, T. Falton, Lough Glynn, Castleragh, Galway; sixth, P. Flood, Tullycrine, Kilmsh.

WOOL.

Long wool.—First and second prizes, S. Mowbray.

Short wool.—First and second prizes, S. Mowbray.

Irish manufactured tweeds.—Prize, Martin Mahony, Brothers, Blarney Mills, Cork.

THE SMITHFIELD SHOW WEEK.

At the Farmers' Club dinner on the Tuesday, Mr. Horley, one of the stewards at Birmingham and one of the judges in London, said "Foot-and-mouth disease was now so rife, and had become such a universal epidemic, that some persons thought it should be stamped out as the cattle-plague was. He himself believed that the half-measures at present in operation had no tendency whatever to check the disease, while they were certainly a great hindrance and annoyance to numbers; and unless the owners of stock and the public were prepared to revert to the rigid regulations adopted in the case of rinderpest, he could see no end to the evil." Here arises the very pertinent question *are* the owners of stock prepared to revert to these rigid regulations? As the answer most assuredly is that they are *not* willing to do so. On the opening morning of the Smithfield Club Show the opinion of many leading agriculturists went to declare that the agitation over this matter was for the most part idle and useless. At the general meeting of the Smithfield Club on the same day, Mr. Giblett, who spoke as representing not merely his own feelings and experience, but the opinions also of a great many influential graziers by whom he is employed, expressed "a hope that the meeting would see the necessity of sending a deputation to wait upon the Privy Council to ask for a modification or the removal of many of the restrictions relating to foot-and-mouth disease"; while Mr. William Torr said that foot-and-mouth disease did grazing steers and growing stock very little harm. It is, in fact, plain on the face of it that the proposed panacea for slaughtering foreign stock at the landing ports would do little or nothing to check the progress of such diseases as those the home-producer is now suffering from. Foot-and-mouth disease came into the Agricultural Hall either direct from Birmingham or from the owners' own stalls, there not being, we believe, in a single case, any suspicion even of foreign contagion. However, this line is still held to in some quarters, and it is thus possible that early in the new year two companion deputations of farmers may seek audience with the premier, the one body to urge that the restrictions on the home trade may be abolished, and the other to ask that the restrictions on the foreign trade may be increased. Of a truth, there would seem to be rather too much of this sort of thing. During the week animals have been continually falling in the Hall, if but few or none of these were removed; although on the Friday many of the exhibitors were on application refused permission to pass their beasts out of London back home again, or on to other shows. Of course spontaneous appearance or induction from excitement and suffering, would be utterly absurd explanations of the outbreak at Islington, and yet further than this there is not an atom of evidence.

In the collateral business of the past week the meeting most in season with the cattle show was that at the Farmers' Club, where breeding facts and principles came under consideration at the instance of Mr. Fowler, of Aylesbury. The "facts" of the opening address must have been tolerably well known to everybody; nor was any very particular principle from these premises put with much emphasis. Still the paper will do good if it only induce people to think more of the subject, although the occasion was certainly not up to the standard of a show-week discussion. The dinner of the Farmers' Club was far more successful, the company being held together to the

last, always a sure sign of people not having wearied of an entertainment. But we, of course, give full reports of both these meetings. At the Society of Arts on the contrary, whither sewage failed to attract the farmer, Mr. Bailey Deaton delivered himself of an almost interminable essay, the reading of which occupied some hour and a-half, and necessarily interfered with any further debate, as these meetings are limited to two hours each.

The chief matter for congratulation in the report from the Council of the Central Chamber of Agriculture is the organisation of branch Chambers. Indeed, as we have from the first maintained, the most useful feature of this scheme has been the establishment of local Chambers, which are simply Farmers' Clubs with occasionally more scope. And a country Club has with few exceptions, ever had something ephemeral in its character. How many have we known flourish and fade, as we notice that the non-paying indifferent members have already become a difficulty with some of these local institutions. The question of ways and means, however, would seem to be a yet more serious case with the Central Chamber itself, where, according to the financial statement, "the arrears are very heavy," in spite of the "repeated applications made by the Secretary for payment." This does not sound well for a comparatively young Society, if something of the cause of any such apathy should be tolerably apparent. The world soon grows weary of people who are always begging under some plea or other, and local taxation, cattle diseases, travelling expenses, and so forth, have been tolerably well worked in this way. On the other hand the Royal Agricultural Society has, we believe, now brought its arrear list under reasonable control; while by the Report, "the arrears of the Farmers' Club have never been more closely collected." The Royal Society, however, has been losing money of late, chiefly from the protracted trials of implements, a business of which none are probably now more sick than the implement makers themselves. At Wolverhampton the very useful results could have been obtained at half the cost of labour, time, and funds; while the public evinces the very slightest interest in the proceedings; and further, we have little doubt but that if the Council does not deal resolutely with this preliminary part of the programme, the competition will gradually fall away. In a word, this business "does not pay"—anybody, and Lord Vernon's Committee must reform it altogether.

A WHOLESOME MOVEMENT.—At the meeting of the Banbury Agricultural Association, a premium was offered by Mr. Perry for the best general crop of swedes from seed supplied by, and on land manured with artificial manure purchased from Mr. Perry. The prize was awarded to Mr. N. Stilgoe. Mr. Z. Stilgoe asked why Mr. Perry could not offer his prize like Mr. Bartford without any restriction whatever. Mr. Davis: They should be invited to throw them open. Mr. Smith: They will be safe to decline. It will be in a manner refusing them if you don't accept them on their conditions. Mr. Rusher: If you carry out this you will have to go back upon your ploughing prizes. Mr. Berridge said there was not so much expense incurred in judging the ploughing as the roots. It was agreed that it was not advisable to continue to receive prizes for root crops containing restrictions as to the purchase of seed and manure after the present year, and the donors should be invited to offer them for open competition.

THE SMITHFIELD CLUB SHOW.

THE OPENING MORNING.

At the November meeting of the Council of the Smithfield Club a letter was read from Mr. Robert Wortley, a well-known exhibitor, suggesting that no animal sent to Birmingham should be eligible for entry at Islington. Of course the most manifest effect of any such a condition would be to reduce the standard excellence of either meeting; while no question the Midland Society would suffer the more of the two from such an arrangement, as "the best of everything" proverbially comes to London. However much or little the Club may feel inclined hereafter to entertain such a proposal, the principle has this year, from mere force of circumstances, been adopted by the management. A number of the beasts sent in from Birmingham have been pronounced by Professor Simonds and his fellows to be labouring under disease, and to be consequently inadmissible at Islington. As we have already said, a crowded building and continual excitement are probably more conducive to the development of such disorders as those our stock now suffers from than we have so far been disposed to allow; but it is very noticeable that up to late on the Thursday afternoon no case of disease had been discovered in Bingley Hall! The veterinary inspector, was, as we are assured, very zealous in the discharge of his duties, where he found nothing wrong; and yet no sooner do the same animals, after a few hours' journey by special train, come again under official examination than they are declared to be unmistakably diseased. It is said, on the one hand, that any such ailment is of the slightest and most superficial character, as, on the other, that many of the beasts are actually *recovering* from severe attacks. It is only to be hoped that the fullest possible report will be presented to and published by the Club at the very *earliest* opportunity. Were the veterinarians of the Midlands at fault? or, can disease be developed in a few hours' journey? or, are we more or less the victims of a Panic?

Even further, some animals which had been sent direct from their home stalls were also condemned, while in some of the divisions, such as the Shorthorns, and more especially the Herefords, the original entries were below those of last season. It was consequently fortunate that more of the Birmingham beasts were not east, as these served materially to strengthen, if not to "face" the show with its chief ornaments. Thus Mr. Stratton's white ox was still the first of his class, with Mr. Farthing again second, as it may be as well to say here that the judges divided over the best of all at Birmingham, the pretty general opinion in the Hall this morning being in favour of the Shorthorn. Mr. Bruce's Polled heifer, however, held her place here again at the head of the class, but was manifestly amiss. Again, the best Shorthorn steer in the middle-class, Mr. Bruce's beast, was also first in Birmingham, where Colonel Lindsay's second was then third; but disease had cut down the competition to the three prize animals. The best Shorthorn cow was also the best at Birmingham, while the third, Rose of Windsor, a purchase at the late Mr. Foljambe's sale, was a winner in the breeding shows last summer at Brigg, Peterborough, and Liverpool. Saving in the second class of steers, there were not many Shorthorns absent, while we must borrow from our last number something of that which we have already said of the best of this breed: "Mr. Richard Stratton's 'walking advertisement' for the Burderop herd,

has gone on famously. He is a particularly handsome beast, and has continued to feed very level, as in fact for his weight and size it is not often that a better balanced ox has been brought out. He is very good to meet, has a neat bloodlike head, and, a great point, is better out than in his stall, so gay is his carriage and so smart his appearance. His touch is wealthy enough for that of a Hereford, or, as some superfine connoisseurs might call it, rather strong, but in our times this is a fault in the right direction. Moreover, the white steer is 'well-connected,' for his grandam on the sire's side, Diadem, was a gold medal cow at the Smithfield Club, and his half-sister, Village Rose, 'a very sweet lengthy heifer, with every promise of growing into a handsome cow,' was the first prize calf at the last All-Yorkshire Meeting, where she beat the second prize calf from the Wolverhampton Royal. By Bude Light out of April Rose this ox is a twin, but the other went wrong and died young. As is well-known his breeder, Mr. Richard Stratton, died a few months since, and the ox was entered here by one of the sons, Mr. Joseph Stratton, so that he was ineligible for the combined fed-and-bred premium. Otherwise, up to a certain point, he won everything he could easily enough, as, beyond his class, when it came to the best of all the Shorthorns, the judges had the winners in the several classes paraded just for form's sake, and then arrived at an instantaneous decision. We quite expect to see the white ox do as well in London as he did at Birmingham, if not even better, for with three Shorthorn judges against a mixed bench, the Shorthorns have now always 'the pull' at the Smithfield Club when it comes to a comparison of breeds. Further on it was not by any means a great show of the sort. The best beast at Oakham, Colonel Reeve's great red ox, was not here—not that he could have made any great mark."

Colonel Reeve's ox is at Islington, where, as we expected he has made no mark. Of the cows we said at Birmingham that Sir Walter Trevelyan's "winner was a long way the best of them; and a good straight heavy-fleshed cow, with a capital touch and a broad back, but somewhat steery in her character. The Princess of Oxford, for so is she called, is a half-sister to the Princess of Yetholm, the best cow in Birmingham and the cup cow in London, two years since, and the one bears a striking resemblance to the other, having just the same flashy red-and-white markings in her coat, and the like beefy look about her—a sort of animal which you fancy more in the stall than on the pastures." And Princess of Oxford is again the best here.

Numerically the Devon was the best filled section in the Hall, but much of the collateral interest was destroyed by certain disqualifications. Thus, Mr. Senior's best of all the Devons at Birmingham was out of it from disease, and hence no line from previous performances could be taken. Her Majesty's young steer, however, was first in the Midlands, where Mr. Smith's first in the next class was second to one of Mr. Taylor's not entered against him here. Neither the first nor second Devon heifers were at Birmingham, where Mr. Senior's senior third was first. The famous old Actress from Flitton was at eleven years and a-half old the best cow, although she has quite gone in her quarter, with the better butcher's beast, Musk, as her second.

The Herefords ran up to a very short show, where one of the best was a fresh cultry from Mr. Heath of Mr. Meire's breeding, a very handsome ox forward, with a good touch, but mean in his quarter. The best of all the Herefords at Birmingham was not here, and the third in the old class, was, as we expected, no prize-taker in London. There seemed to be question of age hanging over the youngest class of Hereford oxen, as no placards had been put up when we left; but in the next division Mr. Groves' third at Birmingham, and a nice animal out, was now first, his conqueror in the Midlands, Mr. Pike's steer being well out of the way in the preceding class; and Mr. Bettridge's second here displaced. Her Majesty's heifer was still the best of her class, as no doubt one of the best of a moderate display of Whitefaces.

Mr. McCombie's famous dun Highlander was fairly beaten by a better beast, and at most points a good one from Luton Hoo; while the best Polled ox at Birmingham also found his superior in a more stylish beast, bred and fed in Norfolk; Messrs. Martin's entry being scratched. A good show of Sussex we did not see out; there were a few red Polls and fewer still Longhorns, one Welsh ox in the entry, and two Irish, where the winner looked like a Shorthorn. The Crosses were better than in the Midlands, but what kind of a cross is that between a Shorthorn bull and a Lincolnshire cow? It certainly seems to run all one way.

As usual, the Keythorpe flock has a long lead with its beautiful high-bred Leicesters; while four Cotswolds in two classes and four Lincolns in two classes can scarcely command either hasty or deliberate notice, but Mr. Byron's wethers are really good. The Southdowns were much above the Birmingham entry, and the Prince of Wales' pen in the first class never caught the eye of a judge; Mr. Rigden's good backs reviving the Hove repute in the first class, and Sir William Throckmorton's thoroughbreds having deservedly the call amongst the light weights. The Shropshires and Oxfords both ran to short entries; it being a very near thing between the first and second pens of Oxfords, although ultimately the better quality of the Blenheim pen carried the award.

The three classes of white pigs were all moderate, and the blacks and other breeds far better; two or three small classes being generally commended. In our report of the Birmingham show we said that "far away the best were Mr. John Biggs' Berkshires, which might have taken any extra premium as the best of all, instead of merely the best of two classes;" and at the Smithfield Club this same pen of Berkshires takes the Cup as the best of all.

DURING THE WEEK.

It is becoming more and more apparent that the stewards of stock shows have occasionally graver duties to discharge than merely putting the animals in their places, or ordering them out again for the inspection of the judges. As we have already attempted to demonstrate, the evils attendant on the exhibition of pigs can only be corrected by far more resolute action on the part of the management, as some closer supervision of the entries will be clearly necessary in other directions. At the recent meeting in the Midlands an ox took a prize as a cross-bred beast, being described in the catalogue as by a Shorthorn out of a Lincolnshire cow; on inquiring as to what a Lincolnshire cow might be, we were informed by the exhibitor's representative that this was an old Longhorn breed, whereas we had imagined that the Lincolnshire cow had been beyond the memory of man to all intents and purposes a Shorthorn. Attention was, we believe, called to the case by one of the stewards at Birmingham, but he was over-ruled, and

the same ox came on to Islington, where on Monday he again took a second prize, when, as our readers will remember, we pertinently put the question in our opening report of the same afternoon, as to "what kind of cross is that between a Shorthorn bull and a Lincolnshire cow? It certainly seems to run all one way." Subsequently the stewards took the matter up, and on the day following the prize placard was removed, and the subjoined notice substituted: *Disqualified by the stewards—breeder's certificate incorrect.* This is perhaps not so precise as could be desired, as assuming that the certificate had been satisfactory, would an animal by a Shorthorn bull out of a Lincoln cow be passed by the Club as a cross? As we take it, a Lincoln is much the same thing as a Yorkshire cow, that is, a Shorthorn sometimes with, and sometimes without a pedigree. We are induced to dwell the more upon this matter, because it is affirmed that beasts have won before now as cross-bred, when these were in fact bred all one way. At a fat stock show none are more interesting than the entries in these classes, as many of these experiments result in the best of butcher's meat; but it is of course as requisite that the particulars as to how such animals have been produced should be as correctly given, as is required in the case of the pure breeds.

Having already said so much of many of the animals exhibited here, it is not our purpose to go again very minutely over the small show of the Smithfield Club in 1871; as whether from subsequent misapprehension or original intent, small this was in many of the leading classes of both cattle and sheep. Indeed some of the general commendations which appeared in the first list have since been struck out, as such an appendix had often little or no actual meaning. Thus in the youngest class of Hereford steers there were but two beasts in competition, one of which received the first prize and the other second, as precisely the same thing happened with the Hereford heifers, which was again reduced to match between her Majesty's and Mr. Allen's nice lengthy heifer. There was more competition amongst the Hereford oxen, where Mr. Heath's best, who never had a chance for the Champion plate, was still so immeasurably superior to the others brought out against him, that a general commendation seems as inexplicable as that over the Shorthorn cows at Birmingham. The fact of such a thoroughly moderate patchy animal being put second does not say much for those behind him; and Mr. Bettridge's "best of all the Herefords" was not entered at Islington. Although alarmingly short of numbers, the Herefords, thanks mainly to some fresh white faces, made a better show than they did at Birmingham: the first and second cows in Bingley Hall being amongst others here deposed by a far more comely cow, which has in turn been a winner about home in Shropshire, and later on in Norfolk; though Mr. Wortley declines to risk a trial immediately previous to the London week.

Amongst the Shorthorns there was but little new blood of much mark, and there is consequently little more to be said of this section than that we have said already, and this was no great deal. In fact, had the Wiltshire white been kept out in the cold by the veterinarians, it is difficult to see where the Shorthorn judges could have gone for their champion. In the heifer class there were, no doubt, some nice well-bred and well-fed animals, led off as these were by Mr. Kennard's really sweet heifer Christabel, against whom Mr. Tidy's Birmingham first had not the ghost of a chance. The Midlands award, however, was no doubt a mistake, for, as we wrote at the time, "the winner is the plainest and commonest of the three prizes, as we should doubt very much her holding her own in London;" and at Islington the Tamworth heifer was not even com-

mended. As something of a curiosity in these steam-plough-times, it was stated that the third prize Shorthorn ox had been put to plough.

Still fated to be near, if never to be quite first, the Devons, as a breed, either for general merit or numerical strength, made up the best section in the show, and this notwithstanding the banishment of "the best of all the Devons" of the previous week; while his second in the class and "the best ox bred and fed by an exhibitor" at Birmingham, now took no prize whatever, although his great opponent was so conveniently out of the way. The class here was certainly commended, and deservedly so too; but then the judges put at the head of it a beast that was only third in the Midlands, where he never seemed to be put in comparison with Messrs Senior's and Smith's entries; as we must hold that the Exeter ox was overlooked by the London judges. As placed against the Somerset, we infinitely prefer the previous award, and as we should go still stronger against the great, patchy, coarse steer put second. In judging a Devon, under any circumstances a man must keep in his mind's eye a certain neatness of frame and "best beef" quality, which the Young Exeter possesses in a very eminent degree. On the face of it there is something incongruous in a third prize beast from Birmingham being selected by a set of judges as their champion in London, and of course there was virtually no race when it came to trying conclusions with the Shorthorn. Otherwise, the Islington trio held very much to the Midland line, save where interrupted by accessions or omissions. It should be mentioned that Mr. Pope had to stand aside in the class of Devon heifers, being the breeder of Mr. Jefferys' second prize, and that for a similar cause Mr. George Smythies took no part in placing the old class of Hereford oxen. This reads rather awkwardly when a man selected as one of three specially appointed for his knowledge of a particular breed has no voice where probably his influence is more particularly required. For instance, was the class of *Hereford* oxen generally commended by the *Devon* judges?

The casting out of Messrs. Heasman's and some other entries told much against the show of Sussex, of which, however, the oxen and cows ran to two very good classes. Mrs. Coote won with a very stylish beast, and the best cow from Beckley is a straight, clean, good animal, which has not lost her feminine character, and the class was commended, but then it only reached to four entries. The best Norfolk Poll had done but badly, and his place did not say much for the sort; and although the judges added a commendation to the awards in one class and found no merit in the other, the "other Scotch breeds" are more or less of a failure. The first prize ox of this other breed is described as a "Scotch Highland," but then, what is the difference between a Scotch Highlander and a Highland Scot? As we said in our Birmingham report, Mr. Bruce's Poll rather lacks scale, as this may stay her from reaching quite to the top of the tree in London; but beyond this she was clearly "off" at Islington; although under any circumstances we do not think that the previous reading would have been confirmed. There was certainly some threat of calling in an umpire between the two sets of judges, but public opinion went all with the decision in favour of the Shorthorn, not the best steer in the late Mr. Stratton's opinion which he ever bred, although he serves to make a very good beginning for the son. In fact, the younger Strattons and Seniors threaten to quite eclipse the old hands. One of the prettiest crosses was, by the way, that shown by an uncle of the Plate winner, Mr. Joseph Stratton, who put the pure Shorthorn on to a mixed Brittany-and-Jersey cow with a very successful result. It was one of the very pets of the week. Mr. Linkwood Brown's big blue ox, the best of this same cross-bred class, was at one

time rather fancied for the finish; and from the same stalls came a Shorthorn and Highland "nick," very happily blended, which was assumed to be the second-best cow in the Hall; so that all the honours in this way went due North.

At Oakham the Keythorpe Leicesters beat Mr. Byron's Lincoln, as many maintain they should have done at Islington; but never was the Champion sheep plate so open a race. There were good judges who would have given this to Lord Chesham's capital pen of Shropshires, even if they were not quite sorry; there were a few who preferred Mr. Morrison's really good-looking Hampshires, so far in front of their own class, where the Kent-Hampshires were miserable seconds; while the shortwool bench had out Sir Robert Throckmorton's light-weight Southdowns, but two very mealy faces ruined their appearance, and so Mr. Turner and his fellows had to depend on the good backs and trim frames of Mr. Rigden's best pen, though with a sour-headed sheep amongst them. Still here, too, there was for some time a dead-lock between the two sets of judges, until ultimately Mr. Little "went over," and the fine fleeces of the Lincoln for once carried the day. It was, however, not by any means a strong entry of Southdowns, the Duke of Richmond winning in the old class with a pen of very plain sheep; and putting public opinion against that of the judges, we believe that Lady Berners' beautiful Leicesters should have been the champion sheep of the show. However, Mr. Lynn and his fellows had settled their fate before it came to a division, although a decision might have been sooner arrived at had the Leicesters been left in. As we said last week, the show of some breeds of sheep was very limited, as without "going to book" we should say the Cotswolds, the Lincoln, the Shropshires, the Oxford, and the crosses were all numerically below the average of the last few years, as the crosses were also in merit. And yet a few days before the opening, rumour, assuming a semi-official tone, spoke out as usual about the show being in almost every way larger than ever.

The £100 Champion Plate has been won year by year since its establishment by a Shorthorn, while the silver cup for the best pen of pigs in the Hall has now gone for four shows in succession to blacks. The judges had, indeed, a very poor opinion of the whites generally; and though they threw in a commendation here and there, or more properly but *two* commendations in *three* classes, they generally commended the three classes of "other breeds," or, in point of fact, Berkshires, where the three first prizes were taken by Mr. Biggs, who had already shown the strength of his hand at Birmingham; but the competition here was stronger, as evinced by the displacement of Lord Ailesbury's and Mr. Bailey's good pigs. It was, in fact, all through a capital show of Berkshires, led off by some of the most useful farmers' pigs ever exhibited. The smaller black pigs, apparently crossed and re-crossed and "improved" out of any especial breed, also made up a very excellent although limited exhibition, and the white "fancy" will clearly have to look to its colours, or these will go fast out of fashion. There is plenty of room for the Yorkshiremen to make an impression at Islington.

May we protest against the abominable way in which the catalogue is brought out, with sheet advertisements under the pretence of plans of the place, stitched in here and there throughout, an annoyance and an impediment only to be got over by straightway tearing out not so much this superfluous as ill-disposed matter? We are glad to see that Mr. Leeds, the new chairman of the Hall Company, has had the good taste to order his own name and that of the Hall secretary to be struck off the title page of the catalogue, where, as we have said before now, such titles

had no more right to appear than on the catalogue of the Royal Academy. Let the Agricultural Hall Company advertise itself and its officers by all means in the proper place; but if, as we take it, the Council of the Smithfield Club has some control over the arrangement of its own material, might we ask why every page of this work is introduced and disfigured by a flash bill-sticker's notice, about the Islington Horse Show? Is it to be inferred that the Council is desirous of having it understood that these two exhibitions are joint concerns? If they are not, the appearance of such advertisement in such a place is simply an impertinence. The Club might as consistently head and tail every page of the catalogue with Hengler's Circus, or any other mountebank performance in preparation at the Agricultural Hall.

THE IMPLEMENT DEPARTMENT.

If, as was recently shown in our columns, the annual value of the live stock of the United Kingdom is about 75 millions, the tillage-crops, grain, roots, grass, flax, &c., rank far higher in value, reaching to nearly three times that amount; hence the implements and appliances required on the farm, and the samples of seeds and roots shown, have a special interest both for producers and consumers. Every year some improvement is made in existing implements, machinery, and vehicles for transport; therefore a tour of the implement galleries, to see what novelties or improvements there are, whether prices have gone up, or what reduction competition has led to, becomes essentially necessary to large classes of the community.

Here congregate not only metropolitan visitors, many of whom perhaps scarcely know the use of a plough or harrow, or the purposes for which a cake-breaker is required; but here also through the practical men, who expend large amounts on the best improved tillage or harvesting implements; and here also come the foreign and colonial agriculturists who are following steadily in the track of that science combined with practice, which the old Royal has so long and so steadily promoted by its annual shows. True, the limited area of the Agricultural Hall affords scant space for the ambitious implement and machine makers, many of whom could cover readily the whole arena with specimens of their handiwork, but cabined, cribbed, confined within a few yards of space they are obliged to be content to show but one or two of their best and most approved machines or engines, so as to keep their names before the agricultural world, and have at least the chance of booking orders. It is remarkable how year by year the agricultural machinery and implement trade has grown, until in this business there have arisen giants in the land, whose works are veritable towns and whose implements are found in use in every country of the habitable globe where agriculture and its collateral branches are carried on. Not only have limited liability companies been formed to carry on many of these great undertakings, but some are obliged to disencumber themselves of minor affairs by handing the manufacture of these over to smaller firms, so as to confine themselves to big things—steam engines and steam ploughs, and all the other great appliances of steam to cultivation, forming now an enormous portion of the machinery and implement trade. Only those who look into the figures even of our export trade can have a conception of the magnitude to which the business of the agricultural engineer has grown.

There are just upon 2,000 factories in the United Kingdom employed in the construction of machinery, about which 167,000 hands are engaged, and those occupied with agricultural machinery and implements form a very large portion of the number. To say nothing of the large amount of implements and machinery now in use at home for the 46 million of acres under all kinds of crops, bare, fallow, and grass, the value of which it is difficult to estimate even on the farm, we know that the quantity sent abroad is getting larger year by year. The value of the machinery of all kinds exported in the past three years has averaged 3½ millions, and that of the steam engines about two millions more, whilst the special agricultural implements make up another quarter of a million.

After these few preliminary remarks, we proceed to the business of the Show, and mark with satisfaction in the first place that the Council has made a clean sweep from the hall and galleries of all articles not properly of agricultural utility, banishing all such outsiders to the arcade and the concert hall. Indeed, so restrictive has the line been drawn

at last that many exhibitors complain of the exclusion of legitimate articles. However, we think it far better to err on the right side in determining what shall not be admitted, as there is thus the more room afforded in the body and gallery of the hall for engines and implements purely agricultural. Having made as careful a survey of each individual stand as the crowded condition of the hall would admit, we are now prepared to give a brief notice of what was really shown, preferring this to the preliminary notices sent us by exhibitors, many of their exhibits being often left out for want of space or other cause. It was evident from the way orders were being booked in all directions, and cheques passed, that a good general business was done on all sides. This is not the time to criticise or comment upon the respective merits of the implements shown, which have been tested during the season just ended, and we must be content in most cases to give a mere enumeration of the specialities of each manufacturer.

Amies, Barford and Co., Peterborough; specimens of their prize apparatus for steaming food; several oilcake and corn-grinding mills, patent steam-ploughs and a model of Campain's anchor for steam cultivation; and a model of an elevator.

Ashby, Jeffery and Luke, Stamford, a fine collection of chaff cutters, with covered cog-wheels; a vertical engine on high wrought-iron road wheels, a strong self-moving traction engine adapted for the Fiskeu ploughing tackle, and some of their well known horse-rakes and hay-makers.

Aveling and Porter, Rochester, an 8-horse power agricultural locomotive, a 12-horse steam-plough, and a 20-ton steam road-roller. The excellence of these engines, &c., are too well known to need comment.

John Baker, of Wisbeach, one of his blowing, winnowing, and screening machines.

Thomas Baker, Compton, some liquid manure and water carts.

George Ball, North Kilworth, near Rugby, carts and waggons, chaff-cutters and horse gear.

Thomas Ball, Northampton, a potato-plough, improved criterion double-furrow plough, and a reaping machine.

W. Ball and Son, Rothwell, a good collection of prize waggons, carts, double and single furrow ploughs, harrows, and iron seuffers or scarifiers.

A. C. Bamlett, Thirsk, several of his mowers and reapers, including his new self-raker, in which the position of the corn side wheel enables it to be easily turned at the corners of the field, and his combined mower and reaper, with an arrangement by which the speed of the knife can be instantly reduced or increased.

Barrows and Stewart, Banbury, a combined thrashing and finishing machine with a 4ft. 6in. drum, and a portable 6-horse steam engine; the steam-jacketed cylinder being placed on the smoke-box end of the boiler greatly economizes fuel. The Oxfordshire wrought iron cattle crib and swing water-barrow were also shown.

E. H. Bentall, Maldon, varieties of his well-known chaff cutters, oil-cake mills, turnip cutters and pulpers; Gardner's cutter, the only one that did not choke in the Oxford trials.

Beverley Iron and Waggon Company (Limited) had on their stand some grass mowers, two 1-horse reapers, a double self-acting swathe delivery reaper, a cattle cart with shafts to attach to either end, an improved liquid manure distributor, some market carts, clod crushers and rollers.

Robert Boby, Bury St. Edmund's, a display of corn screening and dressing machines, double action hay-making machines, and self-acting horse rakes.

W. Brenton, St. Germans, Cornwall, combine 1

reapers and mowers, and a dressing and blowing machine.

Bristol Waggon Works Company (Limited) a good display of their agricultural carts and waggons suited for various purposes.

Brown and May, Devizes, an 8-horse power portable Oxford prize steam engine, and a 2½-horse power improved vertical steam engine.

Burgess and Key, a collection of their direct thrust reapers and mowers; in one the driver's seat is now placed at the side of the main wheel. This is also applied to a 1-horse reaper. A new combined machine was also shown for the first time by this firm. A simple system of oilers is applied to the principal bearings of these machines, ensuring a good supply, and excluding dirt.

Charles Burrell, Thetford, an improved patent agricultural road locomotive, similar to that shown at Wolverhampton. The driving wheels are fitted with cross plates instead of plain tires, which render them less liable to slip on soft ground.

Cambridge and Parham, Bristol, chain harrows, Seaman's harrows for general purposes, land presser, clod crusher, scuffle drags, horse rakes, chaff cutters, and horse gear.

Carson and Toone, Warminster, chaff-cutting engines, Moody's turnip cutters, horse hoes, clod crushers and rollers, and cheese presses, haymakers, lamb cribs, and horse hoe.

Clayton and Shuttleworth, Lincoln, an 8-horse and a 6-horse power portable engine, an improved horizontal 12-horse power fixed engine with self-acting differential motion; a 10-horse power traction engine; a double blast-finishing thrashing machine, and a stacking machine or elevator; screw and lever jacks, and other articles.

Coleman and Morton, Chelmsford, a new potato digging machine, two patent cultivators, a liquid manure distributor, the hop syringing machine which took the prize at Wolverhampton; and an adjustable rotary corn screen.

Thos. Corbett, Shrewsbury, "Excelsior" single and double-furrow and pulverizing ploughs; blowing, winnowing, and corn dressing machine, which has taken 46 Royal and other prizes; economic sheep rack, cake-breaker, and an excellent clover drill with an adjustable arrangement of rack and pinion.

W. Cottes and Sons, Epping, chaff-cutters and ploughs.

Crosskill and Sons, Beverley, one of their Manchester prize pair horse waggons, several one-horse carts, a liquid manure cart and some of their well-known clod crushers.

Corcoran, Witt, and Co., of Mark Lane, a fine collection of mill stones, and apparatus for mills, lubricators, wire, and other articles in which they specially deal.

John Davey, Croft-hole, near Devonport, several of his patent "Excelsior" turn-wrest ploughs, in which all the moving parts are turned at once, one breast being placed in proper position, while the other is raised clear of the beam; they have also the patent share stop and coulter adjustment.

Davey, Paxman, and Co., Colchester, their patent steam corn dryer, which took the Royal medals at Derby and Manchester, and the first prize at Essex and Leicester; also, their patent vertical engine and boiler.

C. Dening and Co., Chard, exhibited several of Spencer's patent prize chain corn drills, which are alleged to have several advantages over the cup drills.

W. and S. Eddington and Co., Chelmsford, an improved standard portable 9-horse engine.

Thomas Fardon, Leighton Buzzard, corn and seed drills, Turner's cultivators, horse hoes, chaff cutters, oil-cake cutters, and ploughs.

John Fowler and Co., Leeds, had on view a 12-horse single cylinder traction and ploughing machine, an 8-horse

engine suitable for thrashing and traction work, a patent turning cultivator and harrow, and other apparatus similar to those tried so successfully at Wolverhampton.

Richard Garrett and Son, Leiston, Suffolk, three of their well-known portable engines, corn and seed drills adapted for every country, lever horse hoes, manure distributors, and corn winnowing and dressing machines.

P. and H. P. Gibbons, Wantage, exhibited a portable steam engine and thrashing machine.

W. Gilbert, Shippon, near Abingdon, an improved Suffolk corn, seed, and manure drill.

G. O. Gooday, Stansted, Bishop's Stortford, a multiple needle sewing machine for making thatch.

John Gray and Co., Uddingston, near Glasgow, a double-furrow plough combining Gray's and Pirie's patents, which has been very successful recently in trial matches.

Hayes and Son, Stamford, harvest carts, general-purpose waggons, and other farm vehicles.

Holmes and Son, Norwich, a portable engine and thrashing machine, corn and seed drill, and barley hummeller.

R. Hornsby and Sons, Grantham, several of their mowers and reapers, especially the "Governor" and "Progress" self-rakers, the "Premier" back-delivery reapers; the "Paragon" and "Manchester" mowers and combined mowers and reapers; an 8-horse portable steam engine and thrashing machine, a 12-row corn and seed drill, adjustable corn screens, turnip cutters and root pulpers. Their double-furrow plough has recently attracted much attention, being of the kind now constructed, and as a proof of its efficiency at the great contest at Reepham, Norfolk, Sept. 27 and 28, it carried off the two silver cups for the double-furrow plough which should produce the best and most highly-finished work, and the best general purpose plough. It stood the severest test of the dynamometer, turns easily at the end of the furrow, and has the anti-friction wheel at the rear.

J. and F. Howard occupied a large space with specimens of their various machines and implements, including their well-known steam cultivating apparatus. Important recent improvements having been introduced into their steam ploughs, the beams are made of a section of steel, the framework of wrought iron firmly bolted together, and the wheels of wrought iron. Among their ploughs was the "Champion," suited to every kind of soil and depth; a two-wheel single plough, fitted with hind friction wheel, so that the slade is dispensed with; and a single plough with grabber tines behind, very useful for root ploughing, as the tines thoroughly remove the pan. They also showed double-furrow ploughs, now so much in demand, the draught of which, as tested at the Reepham contest, was very satisfactory; turnover ploughs, and turn-wrest ploughs. There was also a newly-patented harrow, with double-flanged beams, into which the teeth are securely fastened without screws or nuts. Among the harvesting machines were their self-delivery international reaper, brought out last season, which has been improved and strengthened, fitted with two wrought-iron driving wheels of larger diameter, which considerably lessen the draught; their double-action haymaker, and self-acting horse rake. The Howard safety-boiler of this firm, which is now coming into extensive use on land, as well as for marine purposes, must not be omitted. It is built up solely of wrought-iron tubes, the bursting pressure of each of which is at least 1,000lbs. per square inch.

Edward Humphries, Pershore, showed a thrashing machine.

Reuben Hunt, of Earl's Colne, horse-working-power gear, cake breakers, turnip cutters, and other machines. With the new year Ransomes, Sims, and Head

hand over to Reuben Hunt the manufacture of all the food-preparing machinery which they have hitherto constructed.

Hunt and Pickering, Leicester, two-horse grass-mowing machine, combined mower and reaper, a patent raker with anti-frictional crank movements, oilcake breakers, corn crushers, horse-gear, and root-pulpers.

I. James and Son, Cheltenham, a stone or bone crusher, to work by hand or power; an improved chain pump, a gapping drill, liquid manure and water carts.

H. and G. Kearsley, Ripon, a grass mower and combined mower and reaper.

B. Kittmer, Fulston, near Louth, one of his combined dressing and blowing machines.

J. L. Larkworthy and Co., Worcester, Seaman's patent Excelsior ploughs, duck-footed scuffle drags, root pulper, and patent cattle-crib.

Josiah Le Butt, Bury St. Edmund's, patent self-cleaning corn screens, malt screens, Champion double-action hay-making machine, hand seed drills, malt plough, humane lamb hurdles.

T. Lloyd and Son, Old-street, London, prize flour mills, and dressing machines.

Marshall, Sons, and Co. (Limited), Gainsborough, had several of their horizontal and vertical engines and thrashing machines.

Robert Maynard, Cambridge, patent portable steam and horse power sifting chaff engines, which cut the chaff as fast as the straw can be thrashed.

Melburn and Co. (Limited), London, showed their desiccated grains, which have now been in repute for some years as a cattle food.

Murton and Turner, Kenninghall, Norfolk, some improved prize drills, horse hoes, corn dressing machines, and a hand-seed drill.

Nalder and Nalder, Wantage, one of their thrashing machines.

W. and N. Nicholson, Newark, had one of his combined vertical steam engine and boiler complete on foundation bank, some oil-cake breaking machines, disc turnip pulpers, sack elevators, hay-making machines of various kinds, winnowing and corn dressing machines, horse rakes, and chaff cutters.

E. Page and Co., Bedford, adjustable tooth drag harrow, new adjustable knife disc root pulper, corn grinding mill, steel roller, bean mill, and chaff cutter. They also exhibited Mellard's mould-board plough.

A. E. Peirce, Oxford-street, had a fine collection of tubular wheelbarrows, step ladders, feeding troughs, pails, and other utensils.

Penney and Co. (Limited), Lincoln, expanding rotary corn separator with adjustable wires, seed and flour dressing and winnowing machines, lime and malt screens, sack lift, patent draught preventer, root washer.

Picksley, Sims, and Co. (Limited), Leigh, Manchester, had a fine collection on their stand of mowers and reapers and combined ditto, their self-acting side-delivery reaping machine, and their patent reaper with additional crank movement, very light in draught and clean in cut; also some of their prize chaff cutters and root pulpers.

Thomas Perkins, Hitchin, patent strong double-furrow and three-furrow ploughs, patent folding shafts for reaping and mowing machines, and prize drag harrows.

Priest, Woolnough, and Michell, Kingston-on-Thames, Suffolk corn drills, horse hoes and manure distributors, hand clover and grass seed barrows.

Ransomes, Sims, and Head, Ipswich, had on their stand an 8-horse portable steam engine, a 10-horse economical portable steam engine, a patent double-blast finishing steam thrashing machine, a patent double-speeded back-action "Star" haymaker and horse rake; a variety of their well-known ploughs, including the light

general-purpose plough, Newcastle prize plough, turn-wrest plough, subsoil plough, and double-furrow ploughs; and of crushing mills, a combined mill, a steel oat mill, a bean cutter and a universal mill.

Reading Iron Works (Limited), a new series of small-power fixed engines, an 8 and a 10-horse power fixed condensing engine, a thrashing machine, 1 and 2-horse power clipper mower, horse rakes, barley mower, horse gear, and other articles.

R. J. Reeves and Son, Westbury, corn and seed drills, &c., for small occupations; manure and water cart, Andrews' patent stacker and elevator, manure distributor, and other articles.

Benjamin Reid and Co., Aberdeen, disc corn and seed drill, winnower, broad-cast sowing machine for corn and seed, patent drain-cleaning rods, press drill, adapted to cultivation by irrigation, and good models of drills, and of a wire bridge for parks and pleasure grounds.

Riches and Watts, Norwich, disc root pulpers with adjustable cutters, oilcake mills, American and Eureka grist mills and a model engine.

Richmond and Chandler, Salford, a fine collection of their celebrated chaff cutters, the endless feeding web to these is of great use and safeguard to the man at the mouth; two lengths of cut and a stop motion are added to the power machines. Several sizes of corn-crushing machines were shown, a 1-horse power horse-gear for small machines and some excellent steaming apparatus.

E. and H. Roberts, Stony Stratford, exhibited grist mills, chaff cutters, cake breakers, bean mills, root pulpers, horse works, and a portable mower and reaper knife stand, also a novel self-feeding sheep cot.

Robey and Co., Limited, Lincoln, specimens of their portable engines with expansion apparatus worked directly by the governor, and of their vertical high pressure stationary engines, thrashing machines and straw elevator, and a wheel of one of their road steamers for hauling waggons on common roads.

J. G. Rollins, of London, a fine collection of hay and manure forks and spades, grindstones, weighing machines, pumps, and lawn mowers.

Ruston, Proctor and Co., Lincoln, a fixed engine, 2 portable engines, a saw bench and other articles.

Samuelson and Co., Banbury, had a fine collection of grass mowers, reapers, lawn mowers, and turnip cutters. With regard to all these machines, it appears that little novelty in principle must be looked forward to at the hands of these makers, their reaping and mowing machines having now reached a fixed standard, and become in this respect almost similar to the turnip cutter. In the self-raking reaper we observe several improvements of this kind, including an improved sickle-pin slide, which permits the sickle pin to be taken out very easily without removing a bolt; improved means of raising the off side, changes in the mode of putting in and out of gear, new method of locking the nuts, change in the form of the fingers for discharging all cloggy matters beneath the knife bar, a broader off-side wheel, and an improved head lifter. In the grass mower and combined machine there is less change, one or two minor details only appearing to have demanded alteration; while the Eclipse reaper, which has reached the tenth year of its manufacture, comes before the public without any change in its construction.

W. Sawney, Beverley, a winnowing and blowing machine, a sheep rack, and a sack lifter.

Smith & Grace, Thrapston, gave special attention to chaff cutters, bean mills, and grist mills, which with root pulpers and cake breakers, are the chief objects of their manufacture.

W. Smith, Kettering, had a display of horse hoes, grindstones, and other useful articles.

Southwell & Co., Rugeley, showed a good collection of

chaff cutters for hand or power, corn crushers with roller faces of solid steel, oil-cake breakers with covered cog-wheels, and disc root pulpers, strippers and slicers, and grist mills with chilled surfaces.

G. Stacey & Sons, Uxbridge, had a few chaff cutters.

W. Tasker & Sons, Andover, had of their corn dressing machines, which took the Royal prize at the Bury meeting, an eight-horse portable engine with patent adjustable eccentric and an efficient feed water heater, with thrashing machine, and one of King's drop drills for dibbling seed and manure.

E. R. and F. Turner, Ipswich, several roller mills for crushing corn, malt, seed, and grinding beans, oil-cake breaker, hand and other grinding mills, an engine and combined thrashing and dressing machine.

Tuxford & Sons, Boston, exhibited their prize cultivating windlass, and portable eight-horse engine, and two small improved portable engines, with which they have generally stood the trial tests so well.

W. S. Underhill, Newport, a vertical engine, two-horse double-furrow frictionless ploughs, and single ploughs, horse rakes, four-furrow turnip drills for large occupation root growers.

Vulcan Iron Works (formerly T. Smith), Ipswich, showed counterbalance horse rake, wrought iron cultivator, or broad-share scarifier and harrow combined, new patent beam and Excelsior harrows, and an improved portable sheep rack.

Wallis & Stevens, Basingstoke, an eight-horse portable engine with a fifty-four-inch combined finishing thrashing machine, and slow motion automatic folding elevator, with one-horse gear for driving it.

Joseph Warren, Maldon, chaff machines, an adjustable cultivator and scarifier, horse rakes, ploughs and harrows.

T. W. Wedlake & Co., Hornchurch, a 3½-horse portable glandless steam engine, a portable corn mill with grey stones, horse gear.

J. Whitmore & Co., London, a large collection of wheat grinding and dressing machines, malt and seed crushers.

W. A. Wood, London, some of his well-known mowers and reapers, particularly the Champion self-delivery.

Woods, Cocksedge & Warner, Stowmarket, samples of their root pulpers, cake breakers, and crushing and grinding mills; combined vertical steam engine and boiler, which, put on wheels, is handy for moving, and will consume any kind of fuel; horse gear, and other articles.

THE ROOTS AND SEEDS.

The leading seed merchants vied with each other on this occasion as to who should make the most effective and startling display of mammoth mangolds, cattle cabbages, prize potatoes, and other Brobdignag wonders, and considering the limited gallery space, they monopolised a considerable share. Among the most prominent as regards arrangement and samples shown were certainly Sutton and Sons, of Reading, whose long red sweet mangolds weighing half a cwt. each, yellow globes of 45lbs., champion swedes, and intermediate mangolds of 26lbs. and 28lbs. weight, attracted general admiration from the crowds of visitors. James Carter and Co., of Holborn, also ran very closely with mammoth long red mangold and other prize roots and seeds. Thomas Gibbs and Co., the old-established seedsmen to the Royal Agricultural Society, London, had also a noble display of roots, comprising yellow globe mangolds, kohlrabi, swedes, globe and stone turnips and carrots, besides grasses for pastures and meadows. To go over the exhibits of the other leading seed firms would be but to enumerate the objects, and we must content ourselves therefore with naming the houses, and stating that they

all sought to merit a continuance of support by the excellence of the seeds, agricultural grasses growing, and other objects shown: George Gibbs and Co., London; Radclyffe, Dick, and Co., London; Raynbird, Caldicott, and Co., Basingstoke; Wheeler and Son, Gloucester; and J. R. King, Coggeshall. The latter had on his stand roots which were shown by him at Smithfield last year, at the meeting of the Royal in July, and at other shows, and they were as sound as when first shown.

THE SMITHFIELD CLUB ANNUAL MEETING.

The annual meeting of the Club was held on Tuesday in the Show week, at the Agricultural Hall, the attendance being numerous. The chair was taken by the President, the Marquis of Exeter.

The Honorary Secretary, Mr. Brandreth Gibbs, after reading the minutes of the last meeting, which were confirmed, read the following report of the Council:

The Council beg to lay before the general meeting the report of their proceedings during the past year. The Council have held three meetings, which have been well attended, and in addition to the ordinary routine of business the following subjects have had their careful consideration:

1. The detention for some days at the close of the last Show of a large number of animals, purchased to go into the country, in consequence of foot-and-mouth disease having broken out in the yard. The Hon. Secretary was requested to point out to the veterinary department of the Privy Council the inconvenience and loss that accrued to the owners of the stock in consequence; and to request that if possible some definite arrangement might be made to meet such a contingency if it should again occur. The Council have the satisfaction of reporting that the application has been successful, and that in granting the licence for the present Show, the Lords of the Council have provided for the same as follows:

Cattle moved out of the Show and then out of the Metropolis shall be moved only in manner and subject to the conditions following:

- (1.) There shall be a licence of the Commissioner of Police of the Metropolis for the movement.
- (2.) Such licence shall only be granted on a certificate of health signed by one of the veterinary surgeons for the Show, and a certificate of the pass-master of the Show of the cattle having been exhibited in the Show.
- (3.) If the cattle are moved out of the Metropolis by railway, they shall be conveyed in properly constructed cattle-vans, without stopping, to the railway-station, and there be transferred from the vans directly to the railway-truck.
- (4.) If the cattle are moved out of the Metropolis otherwise than by railway, they shall be conveyed without stopping, from the Show out of the Metropolis, in properly constructed cattle-vans.
- (5.) Provided that if any cattle being so moved, while in the metropolis, come accidentally or otherwise in contact with any cattle not having been exhibited at the Show, they shall not be moved out of the Metropolis, but shall be slaughtered in the Metropolis.

Therefore the healthy animals will not be detained.

II. The Right Hon. Lord Peurhyn, who was chosen as President-elect at the last general meeting, intimated to the Council his regret that advancing years would prevent his discharging the duties of President; but his lordship by presenting the handsome donation of £100 has manifested the interest that he takes in the welfare of the Club. The Council voted their best thanks for the same, and they have elected the Right Hon. Lord Tredegar V.P., to fill the office of President for the year 1872.

III. The Council have to lament the loss by death of the Right Hon. Lord Berners, the Right Hon. Lord Walsingham, and the Right Hon. the Earl of Aylesford, Vice-presidents of the Club; and, also of Mr. John Clayden, the Chairman of the

Agricultural Hall Company, and Mr. Richard Stratton, both members of the Council. Mr. Clayden would have retired by rotation at this meeting, and therefore the Council have not filled the vacancy caused by his death. They have elected Mr. Joseph Stratton in the place of Mr. Richard Stratton.

IV. The Council have revised the prize-sheet for the present Show, and the following alterations have been made: In the division for Scotch polled cattle a new class has been established for cows separate from the heifers. In the Irish division the wording has been amended so as to keep the classes exclusively for Irish breeds. The class for light-weight cross-bred sheep has been discontinued. The rule restricting any animal once exhibited at the Club's Show from being again shown, except as extra stock, has been expunged, and in lieu thereof the following substituted: No animal exhibited at any previous Show of the Club can again compete in the same class. Several minor alterations and emendations have been made.

V. The Council resolves, that in consequence of the inconvenience and risk attending the animals being led out before the judges by the men provided by the Hall Company, and who were strangers to the animals, in future the men in charge of them should perform this duty.

VI. The Council has taken into consideration suggestions made by some members at the last general meeting relative to the preparation of the house list of the members to be recommended for election on the Council; and the Council arrived at the decision that it would be inexpedient to make any alteration in the bye-laws in this respect.

VII. The Council have increased the number of the Judges Selection Committee by the addition of such of the eight senior members of the Council (*i. e.*, those who will retire this year) as are not exhibitors. The Committee therefore now consists of the President, the six Stewards of Live-stock, the eight senior Members of Council.

VIII. In consequence of great inconvenience having been experienced relative to the prize tickets and the placards placed over the animals being taken away by unauthorised persons, the Council determined that means be taken to prevent their removal, and arrangements have been made so that the exhibitors' servants in charge will receive a copy of the prize card to take home with them, and that the butchers purchasing animals will be supplied with a clean ornamental placard and prize ticket (when so awarded), in order that these authentic documents may be placed upon the carcasses when exhibited publicly in the butchers' shops.

IX. The Council have determined that in addition to having every animal weighed and its live weight published, the butcher purchasing each shall be invited to send in a return of the dead weight, and that the name and address of the purchaser shall be published in conjunction therewith in recognition of the wishes of the Club having been complied with.

X. The Council having received a communication from the Agricultural Hall Company to the effect that the publication of an implement catalogue entailed a pecuniary loss, the Council resolved to accept the offer of the Company to add to the stock catalogue a list of implement exhibitors, with the address and trade of each, the number of the stand, and a plan of the building, indicating the position of each stand.

XI. The Council have again voted their thanks to the Rector of Islington, for the special divine service on Sunday last for the herdsmen and shepherds.

XII. The Council lay before the meeting printed copies of the annual balance-sheet duly audited, showing balances in hand on the 1st of December, £2,863 11s. 10½d., and stock invested in the Three per Cent. Consols, £4,664 18s. 11d. This statement will as usual be appended to the prize sheet for the coming year, and sent to each member of the Club.

XIII. The Council have to express their deep regret that the severe and protracted illness of his Royal Highness the Prince of Wales has prevented his being able to carry out his intention of honouring the Club by visiting the Show yesterday afternoon, as had been previously arranged.

XIV. The Council regret to have to report that 18 cattle found by the veterinary surgeons of the Show to be suffering from the foot-and-mouth disease, had to be refused admittance into the Show, in accordance with the conditions of the licence granted by her Majesty's Privy Council. Each of these animals was carefully examined by Professor Simonds, in the

presence of the Stewards of the Club. These animals were taken charge of by the local authorities.

The Council, having regard to the great importance of this subject as affecting the future exhibitions of the Club, and the necessity of all due precautions being taken for the protection of exhibitors' interests so long as the disease shall continue to be prevalent, have determined to endeavour to ascertain the feelings of the members of the Club generally by inviting a discussion at the general meeting on the following point, viz.: "Whether animals exhibited elsewhere within a limited period before the date of the Club's Show, should, or should not, be admitted in future, during the prevalence of the foot-and-mouth disease?" The Council will take the opinions then expressed into final consideration at the February Council meeting. The Council will then discuss whether any, and if so, what modifications shall be sought to be obtained from the Privy Council in reference to the regulations affecting the foot-and-mouth disease generally.

By order of the Council,

(Signed) B. T. BRANDRETH GIBBS, Hon. Sec.

In accordance with the new regulation on the subject, the balance-sheet was laid on the table for circulation among the members present.

Lord Tredegar having moved, and Mr. Turner having seconded, the reception and adoption of the report,

Mr. HEATH said he should like to say a word on the subject of the cattle in the adjoining yard, which were suffering from foot-and-mouth disease. He was unfortunately one of those exhibitors whose cattle were locked up, and he thought it was hard that he should not be allowed to go and look at the bullock himself. He had made application to be permitted to do so several times, but without success. He had seen people running in and out of the yard, and in his opinion they were quite as likely to carry the disease as he would be if admitted. He believed that if he had seen his animal on the previous day he could have thrown the whole of the fever off him in four-and-twenty hours. Only ten minutes ago he saw a bullock standing within a short distance of his Hereford, slaving at the mouth, and just as likely to be dangerous to the cattle around him as his own animal that was locked up would be in the same position.

Mr. GIBBS said perhaps he might be allowed to explain that the animals placed outside the showyard were in the hands, not of the stewards or officers of the Club, but of the local authorities. They were completely out of their jurisdiction, and under the control of the local authorities.

Mr. HEATH asked if the Secretary could give any information as to how he should make application with regard to his ox.

Mr. GIBBS said that no doubt the necessary information would be obtained from Mr. Allen, the veterinary inspector of the district.

The CHAIRMAN then, in accordance with a recommendation in the report, invited the expression of opinions on the following point: "Whether any animals exhibited elsewhere within a limited period before the week of the Club Show should or should not be admitted in future during the prevalence of the foot-and-mouth disease;" adding that the Council would be glad to hear any remarks which might be made on that subject.

Mr. R. WORTLEY (Norfolk) thought it was safer during the prevalence of the disease not to admit the animals. It was better that they should be shut out than that so many exhibitors should suffer from the spread of the disease.

Mr. E. WORTLEY (Rutland) did not think that any restriction on exhibitors was necessary beyond having the proper certificate of health to show.

Mr. SMITH (Exeter) said his servant had told him that a beast which had come direct from the farm was almost the first set aside by the veterinary surgeons. It would be as well, therefore, to ascertain where such animals came from, because there was perhaps too great a tendency to throw the blame upon the Birmingham Show.

Mr. BEASLEY, one of the stewards, said it was true that some of the animals affected had come direct from the farm, but a very large proportion of them had come from Birmingham.

Mr. E. WORTLEY said the proportion of beasts from Bir-

mingham was itself large as compared with what came from any other quarter.

Mr. BEASLEY: We do not want to quote Birmingham alone. Some of them may have come from Oakham.

Mr. SMITH said he had been informed that the servants employed by the veterinary surgeons to open the animals' mouths when they were being examined did not wash their hands before proceeding from one beast to another.

Mr. BEASLEY said that so far as they were under the control of the Club the servants did wash their hands after opening the mouth of one animal before proceeding to another, having had a fresh bucket of water brought them for the purpose.

Mr. TURNER suggested whether it might not be advisable to have the beasts inspected before they were removed from home.

Mr. GIBBS said the plan had been tried during the cattle plague, but exhibitors complained of the expense.

Mr. GIBLET hoped that the meeting would see the propriety, and almost necessity, of sending a deputation to wait upon the Privy Council to ask for a modification or the removal of many of the restrictions relating to foot-and-mouth disease. He represented not merely his own feelings, which were very decided on the subject, but the opinions of a great many influential men for whom he was engaged. Having travelled far and wide throughout the country, he found that foot-and-mouth disease was almost universal. He had seen it in almost every market he had been in. He believed it was the opinion of eight out of every ten men in the country that the present laws on the subject were calculated to perpetuate the disease rather than to suppress it. He had stated that in the highest quarters—to men who had to do with the framing of those laws—and he had had their concurrence in his views.

Lord BRIDPORT said in order that the proceedings might go on regularly, he would suggest, and indeed propose, that the question should be referred to the Council meeting in February, before which there would have been sufficient time to consider the whole matter. He was strongly of opinion that it was the interest of the Club that animals which had been exhibited within a certain period should be excluded.

Mr. TORR begged to second the proposal of Lord Bridport. He quite agreed with a preceding speaker that foot-and-mouth disease was giving the authorities as much trouble as the cattle plague did; but that arose from the circumstance that they never troubled themselves about the matter. He (Mr. Torr) went on the broad principle that foot-and-mouth disease was so prevalent all over England that if very strong restrictions had been adopted at that Show, they would have had a very few animals in the Agricultural Hall; and he thought it was rather unfair to tax Birmingham with a fault which they themselves might have committed if there had been any more Shows to follow. So far as grazing steers and growing stock were concerned foot-and-mouth disease did very little harm; but in the case of milch cows and sheep it was fatal to an extraordinary extent, as he knew from his personal experience. If forty three-year-old steers were offered to him he would not be disposed to give 10s. 6d. per head less for them on account of their having foot-and-mouth disease. He thought that Lord Bridport had taken a most sensible course in proposing that the matter should be referred to the Council meeting in February. The Council would be enabled to gather lessons from what they had seen of that Show, and of the Birmingham and other Shows; and perhaps the result might be something in the shape of a memorial to the Privy Council from the Council of the Smithfield Club, showing what harm had been done and suggesting a remedy.

A MEMBER asked whether there ought not to be a general meeting of the members early in the year?

Mr. TORR replied that there was no reason why there should not be a general meeting if one were desired.

Mr. HEATH observed that the number of members having increased so largely, he should be glad to see some new names on the list. There were now nearly 500 members, and of that number very few he believed had served on the Council.

Mr. E. WORTLEY did not wish to say one word against the Council, but thought it would strengthen its hands to have an expression of opinion from the members generally. Why not take the opinion of that meeting as to whether, if the foot-and-mouth disease existed another year, it would be necessary to do anything more than require the production of

the certificate of a properly qualified veterinary surgeon to the effect that the beasts were free from the disease when sent there?

Mr. TORR thought it would not do to let what was done one year rule what was done in another.

The proposal of Lord Bridport was then put and adopted unanimously.

The report was also adopted.

Mr. SMITH (Exeter) said he hoped a general meeting would be held, as the question was a very wide one.

Mr. TORR observed that the President of the Club had full power to convene a general meeting if he thought it necessary to do so, or on receiving a requisition signed by a certain number of members; but he had supposed that the adoption of the motion just passed was intended to be a substitute for that course.

Mr. GIBBS said, having had some experience in that Club for a great many years, he could testify that when they had endeavoured in cases of great importance to get a good general meeting of the members, there had only been about half a dozen, or seven or eight persons present. He thought that any expression of opinion on the part of that annual meeting would be of far more consequence in strengthening the hands of the Council than such an expression on the part of a meeting convened at a period of the year when probably only very few members would attend. He then proceeded to read a list of the chief prizes awarded for the Show.

Mr. BYRON said it had always been his ambition, ever since he first became an exhibitor, to win a £20 plate; but he never expected to win anything more.

Mr. RIGDEN said it was his good fortune to win the first silver cup that that Club ever awarded, and not having won one since, he was glad to find that it had come back again. He should have been more gratified had he succeeded in getting the Cup that went with the Lincolns; but he had no doubt that if the judges had had an opportunity of tasting the mutton in both cases, their decision would have been in his favour.

Mr. BIGGS briefly returned thanks for the silver Cup presented to him for the best pen of pigs in the yard.

Lord BRIDPORT said he had a proposal to make, which he was sure would be cordially adopted—namely, that his Grace the Duke of Richmond be elected President for 1873. They had, his lordship remarked, had experience of his grace's conduct in the chair already, and they must all recollect how ably he fulfilled the duties of President; and he felt certain that if his grace accepted the present nomination, his manner of fulfilling the duties undertaken by him would be equally satisfactory.

Mr. W. RIGDEN seconded the motion, which was at once adopted.

Mr. W. TORR, in moving the election of six new Vice-Presidents, said: Since the last meeting they had lost by death Lord Berners, Lord Walsingham, and Lord Aylesford, and they had also lost the services of Lord Penrhyn for the reason mentioned in the report. In selecting six new names, the Council had endeavoured to secure the best representation of six different districts of England, and he believed they would command the confidence of the members of the Club. He had to propose that the Duke of Sutherland, Lord Chesham, Lord Cowper, Lord Kesteven, the Hon. Col. Kingscote, M.P., and the Hon. Col. Loyd Lindsay, M.P., be added to the list of Vice-Presidents.

Mr. W. FARTHING seconded the motion, and it was agreed to.

On the motion of Mr. W. Rigden, seconded by Mr. Webb, the trustees were re-elected.

Mr. MOORE said he felt great pleasure in proposing the re-election of the Honorary Secretary. He was glad to have that opportunity of performing such a duty, having recently observed more than he had previously been able to do how much that Club was indebted to Mr. Gibbs for the able and business-like manner in which he conducted the business of the Club (cheers).

Mr. ELLMAN having seconded the motion, it was adopted; and Mr. Brandreth GIBBS briefly returned thanks.

Several new members were elected; after which, it was announced from the chair that there was a large majority in favour of the House List of the new members of the Council. The retiring members of the Council were Mr. H. Aylmer, Mr. J. Beasley, Mr. C. S. Bigge, Mr. J. Clayden (deceased), Mr. C. Howard, Mr. W. Ladds, Mr. C.

Randell, and Mr. J. Wilson. The following were elected in their places: Mr. J. Greetham, Stainfield Hall, Wragby, Lincolnshire; Mr. T. Horley, jun., The Fosse, near Leamington; Mr. H. W. Keary, Bridgenorth, Salop; Mr. R. Leeds, Castleacre, Brandon; Col. H. Lowther, Barleythorpe Hall, Oakham; Mr. J. Quartly, Molland, South Molton; Mr. J. Shuttleworth, Hartsholme Hall, Lincoln; Mr. H. Trethewy, Silsoe, Ampthill, Beds.

Lord TREDEGAR, in proposing a vote of thanks to the President, remarked that it was his good fortune to be present at the sumptuous entertainment given by his lordship to the Council on the previous day, and they all felt deeply obliged to him for his hospitality.

Lord BRIDFORD seconded the motion, which was carried by acclamation.

The CHAIRMAN, in returning thanks, said it gave him great pleasure to accept the invitation to become President of the Club, and he had found the duties not onerous, but pleasant, in consequence of the able assistance which he had received from the Hon. Secretary, Mr. Brandreth Gibbs. He was exceedingly obliged to that gentleman for the aid which he had afforded to him during his year of office, and he was sure that any future President, who was in the same position in that respect, would feel equal gratitude at the expiration of his term of service.

The meeting then separated.

THE METROPOLITAN GREAT CHRISTMAS CATTLE MARKET.

The Annual Christmas Fat Stock Market was held Dec. 11, according to custom. Although some very fine stock was exhibited, the general character of the show did not call for any particular comment. In point of numbers, the show was not so strong as on some recent occasions; but this must be attributed to the regulations still in force respecting the transit of cattle. At the same time, the losses sustained by the foot-and-mouth disease during the earlier part of the season had engendered much caution on the part of graziers, and in many instances stock has been sent forward to the market much earlier than would have been the case, owing to the chance of loss, or deterioration of quality through the foot-and-mouth disease. Unlike its predecessor, the past season has been decidedly favourable for the rearing and fattening of cattle. With seasonable weather graziers have been enabled to keep their stock in the field. They have also been blessed with more substantial advantages as a set off against the chances of loss from disease. The hay crop has been very large, and with the exception of the commencement of the season, when some grass was carried in damp condition, and some portion of it was only fit for the dung heap, in consequence of the rains, by far the larger proportion was satisfactorily got in. At the same time the root crops have turned out well. A heavy yield has been secured, and the quantity has been excellent. Graziers have therefore had increased facilities offered them for the rearing of stock, whilst the price of keep has been somewhat diminished. Last year the reverse of this was more directly the case. The hay crop proved to be an almost entire failure, and the partial success of the root crop but poorly compensated for the loss sustained in the graver respect. The actual weight of meat on sale to-day was barely an average. Those large heavy Beasts, until recently rather common in the market, are now gradually disappearing, and are giving place to the smaller, more symmetrical and weight carrying animal. On the whole the quality of the English stock excited admiration, and it testified to the excellence attained by home breeders in the art of rearing live stock. A noteworthy feature in the show was the improvement in the quality of the foreign stock. The success which has hitherto attended the attempts of foreign breeders to improve their stock, and to enable them to cope more successfully with their English brethren, has been great, and, indeed, is patent to anyone conversant with the condition of the foreign receipts some six years since and those now offered. However, foreign breeders have not as yet arrived at the acme of perfection, although they certainly have made some considerable strides towards that object.

The Scots carried off the prize in point of excellence and there was also a fine show as regards number. North

country graziers are not disposed to yield the palm for purity and quality. The show of stock to-day was in every respect satisfactory, although it must be admitted that the abundance and cheapness of food have enabled Scotch graziers to rear their stock at a minimum of expense.

Shorthorns were well represented, both as regards number and condition. Devons were not freely offered, but the quality was good. Hereford Cattle were not well represented, and there were very few Sussex beasts on the stands. Some choice Welsh runts were offered, and there were a few Irish beasts whose condition did not call for special comment.

As regards foreign stock a moderate supply was on offer, including French, Spanish, and Dutch beasts in improved condition.

The annexed return shows the number of Beasts exhibited, and the prices realised for them, on the "Great Days" during the last 30 years:

Year.	Beasts shown.	s.	d.	s.	d.
1841	4,500	3	8	5	0
1842	4,541	3	4	4	8
1843	4,510	3	8	4	4
1844	5,713	4	0	4	6
1845	5,326	3	6	4	8
1846	4,570	4	0	5	8
1847	4,282	3	4	4	8
1848	5,942	3	4	4	8
1849	5,765	3	4	4	6
1850	6,341	3	0	3	10
1851	6,103	2	8	4	2
1852	6,271	2	8	4	0
1853	7,037	3	2	4	10
1854	6,181	3	6	5	4
1855	7,000	3	8	4	2
1856	6,748	3	4	5	0
1857	6,856	3	4	4	8
1858	6,424	3	4	5	0
1859	7,560	3	6	5	4
1860	7,860	3	4	5	4
1861	8,840	3	4	5	0
1862	8,430	3	4	5	0
1863	10,370	3	6	5	2
1864	7,130	3	8	5	8
1865	7,580	3	4	5	4
1866	7,340	3	8	5	6
1867	8,110	3	4	5	0
1868	5,320	3	4	5	8
1869	6,728	3	6	6	2
1870	6,425	3	6	6	2

The following are the particulars of some of the best portion of this morning's market:

Mr. George Dickson's alley was well filled with Scotch Beasts, principally from the counties of Aberdeen and Banff, and which attracted much attention. The leading lots from Aberdeen were forwarded by Messrs. Knowles, Wishart, Mitchell, Reid, Frost, Beddie, Bruce, Wylie, and Lawson. Those from Banff by Messrs. Longmore, Stoddart, Milne, Pirie, Bartlett, and others.

Messrs. Giblett and Son also had for disposal some excellent Scotch Beasts, bred by Mr. McCombie, M.P., of Tillyfour, Aberdeen; but Messrs. Hicks and Son had one of the largest shows of Scotch cattle, many of these being of first rate quality, and sent from some of the principal graziers and dealers of Aberdeenshire, among whom may be mentioned:—Messrs. Jas. Reid of Grey-stone, A. Mennie of Huntley, A. Bruce of Mid Clova W. Wallace of Chapel of Seggat, A. Beddie of Newlands Hill, J. and W. Martin of Aberdeen, A. McDonald and A. Davidson of Peterhead, A. Stoddart of Munyfold, Geo. Wilson of Milton of Noth, A. Strachan of South Haddo. From Norfolk, Messrs. Postle, S. Gardner, and W. Salmon had some fine cattle at the same stand.

Mr. Duckworth had some choice stock forwarded by Mr. Hudson, and there were also some prime Beasts at the stands of Messrs. Maydwell and Hoyland, Hicks, Thomas Dixon, and Vorley.

The Sheep pens were not overstocked, but some fine breeds were offered. Mr. Collins had some good Downs and Half-breds forwarded by Messrs. Harris, Curtis, and Caird, of Essex.

At Messrs. Lintott and Son's stand were some choice Downs, the property of Mr. Hobgen. There were also

some good Leicestershire, Hertfordshire, and Dorsetshire animals.

Some of Mr. Foljambe's Sheep were in the market; but we failed to notice any sent forward by Mr. Overman.

At the stands of Mr. Stallibrass, Mr. Dodd, Mr. Walsh, and Messrs. Watton and Sons were some good Downs, Half-breds, and Leicesters.

STATE OF THE TRADE.

Notwithstanding the cold weather there has been an absence of animation in the trade. This is doubtless attributable to the fact that the time between this and Christmas is too long to suit butchers, and they have consequently exercised more caution in dealing. On the other hand, the general excellence of no small proportion of the supply has been the theme of universal comment, and has imparted a firm tone to the quotations. The best Scots and crosses have occasionally made 6s. 2d., but 6s. per 8lbs. has been the more general top quotation.

From Lincolnshire, Leicestershire, and Northamptonshire we received about 2,000 Shorthorns, &c.; from Norfolk, Suffolk, Essex, and Cambridgeshire about 1,500 Scots and Crosses; from Scotland, 1,190 Scots and Crosses; and a moderate supply from Ireland.

In the Sheep market there has been a quiet tone prevalent, but the shortness of the supply has imparted a firm tone to prices. For the best Downs and Half-breds 6s. 10d. to 7s. per 8lbs. has been paid.

For Calves there was more inquiry, and prices were higher.

Pigs were steady in value, with a moderate demand.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, December 6.*—

Present: Sir Watkin W. Wynn, Bart., M.P., President, in the chair; Viscount Bridport, Lord Chesham, Lord Tredegar, Lord Vernon, Sir A. K. Macdonald, Bart.; Mr. Baldwin, Mr. Barthropp, Mr. Booth, Mr. Bowly, Mr. Cantrell, Colonel Challoner, Mr. Clive, Mr. Davies, Mr. Dent, M.P.; Mr. Druce, Mr. Edmonds, Mr. Braudreth Gibbs, Mr. Hornsby, Mr. Bowen Jones, Colonel Kingscote, M.P.; Mr. Leeds, Mr. M'Intosh, Mr. Masfen, Mr. Milward, Mr. Pain, Mr. Randell, Mr. Rigden, Mr. Sanday, Mr. Shuttleworth, Mr. Stone, Mr. Thompson, Mr. Torr, Mr. G. Turner, Mr. Jabez Turner, Mr. Wakefield, Mr. Earle Welby, M.P.; Mr. Wells, M.P.; Mr. John Wells, Mr. Whitehead, Mr. Jacob Wilson, and Dr. Voelcker.

The following new members were elected:

Angas, George, Beeford Grange, Lowthorpe, Hull.
Baird, Alexander, Robeston Hall, Milford Haven.
Balston, Richard James, Boxley Abbey, Maidstone.
Bott, Joseph Fennell, Morrell Koothing, Dunmow.
Boucher, Charles, Caenby, Market Rasen.
Bradbury, G. E. Hobroyd, Longroyde, Rastrick, Yorkshire.
Cocks, Charles, Packington, Lichfield.
Eve, Frederick, Sherington, Newport Pagnell.
Fremlin, W. Arthur, Teston, Maidstone.
Hack, Algernon, Buckminster, Grantham.
Heneage, Edward, Hainton Hall, Wragby.
Hilliard, Rev. J. A. Stafford, Little Wittenham, Abingdon.
Huntley, W. V., Welsh St. Donatts, Cowbridge.
Leighton, Stanley, Sweeney Hall, Oswestry.
Mackenzie, James, Camden Quay, Cork.
Paull, James W., Knott Oak House, Ilminster.
Pogson, Frank M., Caythorpe, Grantham.

Pratt, Frederick, Greatford, Stamford.

Price, Henry, Undy, Chepstow.

Pybus, John, Court Farm, Magor, Chepstow.

Rowcliffe, E. Lee, Hall Place, Craunleigh, Guildford.

Stratton, Rev. J. Y., Ditton Rectory, Maidstone.

White, George, Hunton, Maidstone.

Wright, William, Fiskerton, Newark.

Wright, W. Twaites, St. Nicholas, Cardiff.

FINANCES.—Major-General Viscount Bridport (chairman) presented the report, from which it appeared that the Secretary's receipts during the past month had been examined by the committee, and by Messrs. Quilter, Ball, and Co., the Society's accountants, and found correct. The balance in the hands of the bankers on November 30 was £337 14s. 1d. The committee recommend that £500 be sold out of the reserve show fund to meet payments required. The committee recommend that the bye-law No. 76, relating to members compounding for their subscriptions, be extended to governors of the Society. The committee have met nine times, and made nine reports.—This report was adopted.

JOURNAL.—Mr. Thompson (chairman) reported that 19 competitors* had entered their farms for the prizes

*Campbell, John, Down Hanstephan, Carmarthen.

Culverwell, James, Penrose Farm, Abergavenny.

Falconer, Archibald, Berlandrywyll, Llandilo.

Hall, William, Ty Newydd, Brecon.

Hill, John, Llancayo, Usk.

Jones, Griffith, Trevigin, Cardigan.

Jones, John, Pant-y-Goetre Farm, Abergavenny.

Owen, Daniel, Ash Hall, Cowbridge.

Parsons, Valentine, Slough Farm, Caerwent, Chepstow.

Powell, William S., Eglwysnnyd, Taibach.

Price, Henry, Undy, Chepstow.

offered by the President and the Society; that Mr. Bowstead, of Eden Hall, Penrith, had accepted the office of reporting judge; that the President had nominated Mr. Thomas Jenkins, of Plasyward, as one of the remaining judges; and that the Secretary had been instructed to obtain the services of another judge on the list prepared by the committee. It was recommended that the application from the Viceroy of India for a complete set of the Journal, and from the Veterinary Department of the Privy Council for the numbers since 1864, should be acceded to. It was also recommended that the botanical report of Mr. Carruthers, F.R.S., be printed in the next number of the Journal, and that a Botanical Committee be appointed, as jointly recommended by the Journal and Chemical Committees. In reference to the protest of Messrs. Robertson and Richardson against the report of the judges of churns at the Oxford meeting, as published in the Journal, the committee, after consultation with the judges, see no reason to alter the report in question. This report having been adopted, Mr. Dent Dent, M.P., moved that the chairman of the French Peasant Farmers' Seed Fund (Lord Vernon) be requested to furnish, for publication in the Society's Journal, an account of the agricultural features of the work of that institution. This resolution having been seconded by Mr. Wakefield, was carried unanimously.

HOUSE.—Major-General Viscount Bridport (chairman) reported the recommendation of the committee, that a new arrangement be made with reference to the porter, and that in the meantime, pending such arrangement, the necessary temporary assistance in the household be procured.—This report was adopted.

LORD VERNON'S COMMITTEE ON RECEIPTS AND EXPENDITURE.—Lord Vernon (chairman) reported that the committee had arranged a schedule of questions to be referred to the several standing committees of the Council, and that it was recommended that comparative statistical tables in reference to these questions, comprising the receipts and expenditure for the last ten years, be printed for the use of the Council.—This report was adopted.

STOCK PRIZES.—Mr. Milward (chairman) reported the following recommendations of the committee: (1) That no second prize be given unless at least three animals be exhibited, except at the special recommendation of the judges, with the consent of the stewards; (2) that sheep unfairly prepared for show, by oiling or colouring, may be disqualified on the recommendation of the inspectors of shearing; and that (3) the conditions relating to cows and heifers producing living calves be modified in accordance with the resolution at the last Council meeting. This report having been adopted, it was moved by Mr. Jacob Wilson, seconded by Mr. Bowly, and carried unanimously, that the general rule No. 19 of the stock prize-sheet be amended to read as follows: "No animal can be removed from its place without leave from the director or stewards, and any infringement of this or any other rule will render the exhibitor liable to a fine of £1 by the stewards, and to the forfeiture, by decision of the Council, of any prize he may be entitled to; nor can any animal be taken out of the showyard without leave in writing from the director or stewards."

VETERINARY.—Mr. J. Dent Dent, M.P., reported that, in consequence of the death of Professor Spooner, the post of Principal of the Royal Veterinary College is now vacant; and that it is possible that alterations may be made in the staff and course of study at the College. Under these circumstances it was recommended that the Council do postpone its decision on the relations of the Society to the College until the committee are able to make a further report.—This report was adopted.

GENERAL, CARDIFF.—Lord Vernon (chairman) reported that the lists of prizes, proposed to be offered by the local committee of the Glamorganshire General Agricultural Society, had been revised, and were recommended for adoption; that the offer of some additional prizes by the Marquis of Bute be gratefully accepted; and that the following members of the local committee be added to the general Cardiff committee: The Mayor of Cardiff; W. Alexander, Esq.; J. S. Corbett, Esq.; G. C. Williams, Esq.; Major Turberville. The committee had also considered the proposition of the local committee that they should have a separate yard, in which hunters exhibited should be allowed to jump, but they did not recommend this proposal to the Council.—This report having been adopted, the stipulation attached to the prizes offered by the Glamorganshire Agricultural Society was taken into consideration, viz., that the subscribers to that society should be allowed to compete for those prizes on the same terms as the members of the Royal Agricultural Society. This proposal, having been moved by Mr. Randell, and seconded by Mr. Jacob Wilson, was carried unanimously, after a few words from Mr. Dent, who pointed out that this was admitting a new principle, and doing away with one of the inducements which the Society had hitherto held out to attract new members.

SELECTION.—Mr. Thompson (chairman) reported the recommendation of the committee that Mr. Rawlence, of Bulbridge, Wilton, be elected a member of Council, to fill the vacancy caused by the election of Mr. Holland as a Vice-President. This report having been adopted, Mr. Rawlence's election was moved by Mr. Thompson, seconded by Mr. Randell, and carried unanimously.

The Secretary was instructed to address letters relative to the country meeting of 1873 to the authorities of Darlington, Durham, Hull, Newcastle, and York.

The annual reports of the several standing committees were received, and the usual committees were appointed for the year 1872, with the addition of a Botanical Committee.

The report of the Council to the general meeting was prepared.

A communication from the Agricultural Society of New South Wales, in reference to a system of judging stock by points, was referred to the Stock Prizes Committee.

Letters from the Secretary of the Veterinary Department of the Privy Council, and from the Royal Agricultural Society of Ireland, in reference to the alleged diseased condition of Irish cattle imported into England, were laid before the Council, and the Secretary was instructed to forward a suitable reply to the latter communication.

THE CHEMICAL REPORT.

In his annual report, Professor Voelcker states that, whereas in the year 1870 the number of analyses furnished by him were 115 in excess of those of 1869, this year the unprecedented number of 730 analyses, or 150 more than in 1870, had been referred to him.

He calls attention to the further addition to his staff

Pybus, John, The Court Farm, Magor, Chepstow.
 Roberts, Thomas, Malthouse Farm, Lanedern, Cardiff.
 Roberts, W. B., Lovestone, Pembroke.
 Spencer, Michael, West Aberthaw, Cowbridge.
 Thomas, John, Ty Du, Cardiff.
 Thomas, John, Eastfield House, Cowbridge.
 Thomas, Rees, Saint Athan, Cowbridge.
 Till, James, Caerwent, Chepstow.

which this amount of work entails, and takes the opportunity of mentioning that his staff consists of only well-trained paid assistants, several of whom have been in his service for many years.

The following is a summary of analyses made for members of the Society from December 1870 to December 1871 :

Guano	78
Superphosphate, dissolved bones, wheat manures, and similar artificial manures	202
Bone-dust	36
Refuse manures	31
Nitrate of soda, sulphate of ammonia, and potash salts	31
Marls, limestones, fireclays, and other minerals	20
Soils	44
Oilcakes	212
Feeding-meals	24
Vegetable productions	12
Waters	36
Examinations for poisons	4
Total	730

Dr. Voelcker states that several of the samples of manures sent were found all but worthless, and he reiterates his advice that purchasers of artificial manures should always obtain, if possible, a guarantee by analysis of their composition and fertilising quantities. The practice of buying superphosphate of a guaranteed strength is, he adds, gaining more and more ground, and he recommends the stipulation that a proportionate deduction be made if the bulk of manure on delivery do not contain the guaranteed percentage of soluble phosphates.

With respect to bones, they have become scarce and dear, and few manufacturers supply genuine dissolved bones; nine-tenths of the bulk of what is sold as dissolved bones is a mixture of ordinary superphosphate with more or less of bone-dust. Such mixtures should be sold under a name which expresses more fairly the real character of the article.

Most of the samples of bone-dust analysed in 1871 were pure and of good quality.

Sulphate of ammonia has risen much in price this year, the present price being £21 to £22 per ton, and it is very necessary to have the percentage of ammonia guaranteed, which in the first quality should be 25 per cent., and in the second not less than 23 per cent.

The quality of the guano from the Guanape Islands has not improved; three-fourths of the samples of guano analysed by Dr. Voelcker were from the Guanape Islands, and the majority were too wet and lumpy for direct application to the land. Many samples contained from 23 to 24 per cent. of water, and but few more than 10 per cent. of ammonia. In former years such guano would have been sold as sea-damaged, varying according to the intrinsic value of the cargo. During the last season Guanape Island guano has all been sold at one uniform price, and importers would not allow samples to be taken of the quality of the various cargoes, so that analyses might be made before purchase. The sales of guano have consequently fallen off very much.

There is reason to believe that the Peruvian guano which will be offered in future, when the Government sales in this country are undertaken by the new contractor, will be of a superior character. The supply of good guano, Dr. Voelcker adds, is of the greater importance, because, whilst phosphatic fertilisers are being constantly discovered, and the supply from phosphatic rocks and minerals is practically inexhaustible, the sources from which ammonia can be obtained are limited. The supply therefore of guano from the Ballestas Islands, which may

be looked-for next year, and samples of which Professor Voelcker has already analysed, will be most welcome.

The accompanying table shows the analysis of 17 different cargoes of Ballestas Islands guano, an abundant supply of which may be looked forward to for a good many years.

As respects feeding cakes, the Professor again calls attention to the adulteration of linseed cake with earthen cake; and of rape cake, including green German rape cake, with mustard seed.

Five or six cases have been brought under his notice

in which decorticated cotton cake was alleged to have caused the death of sheep and lambs; as, however, some of these cakes were of a superior quality, and none of them contained any poisonous ingredients, it is Dr. Voelcker's opinion that the animals probably partook too freely of the cake, and could not digest the large proportion of nitrogenous compound contained in good cotton cake and he suggests the admixture of Indian corn or some similar starchy food.

Out of the 36 samples of water sent for examination, Dr. Voelcker found many largely contaminated with sewage, and he earnestly invites attention to the serious injury which may be produced to health by the use of such impure waters.

The following are the papers contributed by Professor Voelcker to the February and August numbers of the Journal for 1871:

1. On sugar-beets and beetroot distillation.
2. On the best mode of preparing straw-chaff for feeding purposes.
3. On field experiments on root crops.
4. On the composition and nutritive value of the prickly comfrey (*Symphytum aspernum*).
5. Quarterly and annual reports.

The following is the quarterly report of the chemical committee:—

1. Dr. Voelcker reports the analyses of three samples of guano sent to him by Mr. H. W. Hollis, Estate Offices, Keele, near Newcastle, Staffordshire, in May, 1871.

These three guanos were found to have the following composition:

	No. 1.	No. 2.	No. 3.
Moisture	7.56	7.02	15.55
*Organic matter and ammonia- cal salts	21.67	21.91	40.23
Phosphate of lime	14.85	15.34	23.06
Carbonate of lime	9.67	10.31	—
Alkaline salts	8.08	7.20	6.06
Insoluble siliceous matter	38.17	38.22	15.08
	100.00	100.00	100.00
*Containing nitrogen	4.56	5.01	9.55
Equal to ammonia	5.54	6.07	11.59

The prices of the three samples were—No. 1, £14; No. 2, £12 15s.; No. 3, £16.

The first and second samples are adulterated, for both contain as much as 38 per cent. of sand, and about 10 per cent. of carbonate of lime (chalk); and the one yields only 5½ per cent. of ammonia, and the other 6 per cent. of ammonia, in round numbers.

The composition of these two samples is pretty much the same, the second being slightly better than the first, although it was sold at 25s. less money per ton than No. 1. The third sample is genuine guano, but of an inferior character, inasmuch as it contained 15 per cent. of insoluble matter and yielded only 11½ per cent. of ammonia. Such guano is not worth £16 a ton, and the adulterated samples, No. 1 and No. 2, sold respectively at £14 a ton and £12 15s., were not worth more than £8 a ton.

Dr. Voelcker wrote for the names of the sellers of these guanos, but obtained no reply in answer to his inquiries.

2. A sample of artificial manure, sent by Mr. J. Reeve, Snetterton Hall, Thetford, on analysis, was found to have the following composition:

Moisture	13.53
*Organic matter	25.06
Oxide of iron and alumina	10.35
Phosphate of lime	1.70
Carbonate and sulphate of lime	16.74
Magnesia and alkaline salts	2.01
Insoluble siliceous matter (sand)	30.61
	100.00

*Containing nitrogen87
Equal to ammonia	1.05

This artificial manure, it will be seen, contained only 1½ per cent. of phosphate of lime, and yielded only 1 per cent. of ammonia. It contained 30½ per cent. of sand and a large proportion of oxide of iron, alumina, carbonate of lime, and similar worthless materials.

No information could be obtained respecting the names of the vendors or the price of the manure, which hardly deserves the name.

3. Mr. Edward Taylor, Whitton, Leintwardine, sent a sample of manure, which he purchased as genuine dissolved bones.

This manure on examination was found to contain no more than 10 per cent. of green loam at the most, and consequently was not genuine dissolved bones. The name of the dealer of these so-called dissolved bones could not be obtained.

4. Dr. Voelcker had previously reported on the composition of a sample of fish and bone manure sent by Mr. Nathaniel Baskett, Braines Hall, Wetheringset, Stonham, Suffolk, as follows:

Moisture	11.93
*Organic matter	8.83
Phosphate of lime	3.43
Sulphate and carbonate of lime	51.06
Magnesia and alkaline salts	2.70
Insoluble siliceous matter (sand)	21.93
	100.00

*Containing nitrogen31
Equal to ammonia37

This manure was sold at £5 a ton, but is scarcely worth 10s. a ton, delivered free of cost on the farm.

In answer to the inquiry made as to the vendors, Mr. Baskett wrote on July 6:

"You applied to me for the name of the manufacturer of some fish and bone manure I sent you for analysis a short time since, and which you valued at the low sum of 10s. a ton. I beg to state that I had it from H. Marshall & Co., Wivenhoe, Essex; also from the same firm the guano sent to you at same time for analysis, and which you stated to be adulterated, and not worth more than £7 10s. a ton, and for which I paid £12 15s.—I am, yours faithfully, NATH. BASKETT."

5. Mr. Baskett sent again in July two samples of manure, marked No. 1 and No. 4, which were both sold to him at £5 a ton cash, delivered, by Messrs. H. Marshall and Co., Wivenhoe, Essex.

The two manures had the following composition:

	No. 1.	No. 4.
Moisture	7.51	9.68
*Organic matter	16.25	11.85
Oxide of iron and alumina	1.40	.80
Phosphate of lime	2.46	5.72
Carbonate and sulphate of lime, &c.	67.15	63.46
Insoluble siliceous matter	5.23	8.40
	100.00	100.00
*Containing nitrogen44	.49
Equal to ammonia53	.59

No. 1 manure was scarcely better than the sample of fish and bone manure which Mr. Baskett sent before, and which was valued at 10s. a ton in comparison with Peruvian guano.

This manure it will be seen, contains but little phosphate of lime, and yields only $\frac{1}{2}$ per cent. of ammonia.

No. 4 is very similar to No. 1, but somewhat richer in phosphate of lime, and worth about 7s. more per ton than No. 1. Both these manures consist principally of gypsum and carbonate of lime or chalk.

6. The next case is a sample of blood and bone manure, which was sent by Mr. T. H. Saunders, Watercombe Farm, near Dorchester, who states that it was manufactured by Messrs. Festine, Brothers, near Weymouth, and sold at £5 a ton. On analysis its composition was found to be as follows :

Moisture	22.72
*Organic matter.....	19.97
†Phosphoric acid.....	1.82
Oxide of iron and alumina	11.59
Lime, carbon, and sulphate	8.85
Alkalies, &c.	5.73
Sand	29.32
	<hr/>
	100.00
	<hr/>
*Containing nitrogen.....	.88
Equal to ammonia.....	1.07
†Equal to tribasic phosphate of lime.....	3.97

This so-called blood and bone manure, it will be seen, contained only 4 per cent. of bone-phosphate, and only 1 per cent. of ammonia, and as much as 22 $\frac{1}{2}$ per cent. of moisture, and 29 per cent. of sand. Dr. Voelcker reported it to be worth not more than £1 10s. a ton, but Mr. Saunders thinks 20s. a ton.

In the course of their inquiries, the Chemical Committee frequently find that the vendor agrees to abide by the analysis of Professor Voelcker, and so, the purchaser being satisfied, there is no opportunity for further investigation. Two samples of cake, for instance, were submitted to Professor Voelcker; one, stamped pure, contained seeds of some 20 different weeds, and was made of some very dirty seed. Another contained castor-oil beans, but the purchaser wrote that he was in correspondence with the vendor, and did not wish to have any further analysis.

In presenting their annual report to the Council, the Chemical Committee beg to observe that they have had very serious responsibility thrown upon them, in consequence of the publication of Dr. Voelcker's analyses in their quarterly reports. The Committee offer their sincere thanks to the Council for the support they have received, and the confidence that has been reposed in them. They are thoroughly satisfied of the good that has been done by these publications, and they trust that, while continuing them as usual, the experience they have acquired may render the reports equally valuable to the public, and at the same time not provoke any legal proceedings.

The half-yearly meeting was held on Thursday, at noon, in Hanover Square; the president, Sir Watkin W. Wynn, M.P., in the chair.

The SECRETARY read the following Report of the Council :

The Council of the Royal Agricultural Society of England in presenting their half-yearly Report have to state that since the last General Meeting in May, 6 Governors and 53 Members have died, and the names of 33 Members have been removed from the list; on the

other hand, 1 Governor and 252 Members have been elected, so that the Society now consists of

69 Life Governors,
72 Annual Governors,
1,622 Life Members,
4,030 Annual Members,
14 Honorary Members,

making a total of 5,807, showing an increase of 198 Members during the year 1871.

During the past half year the Council has lost some of the oldest of its members, the ranks of the Trustees having been thinned by the death of Sir Thomas Dyke Acland and Lord Berners; the list of Vice-Presidents by the decease of Mr. Samuel Jonas; and the general body of the Council by the death of Mr. John Clayden. These vacancies have been filled up by the following elections: Mr. E. Holland as a Trustee, in the place of Lord Berners; Sir A. K. Macdonald, Bart., as a Trustee in the room of Sir Thomas Dyke Acland, Bart., and Mr. B. T. Brandreth Gibbs as a Vice-President, in the room of Mr. Samuel Jonas. Mr. M'Intosh, of Havering Park, Essex, has been elected to fill the vacancy in the Council caused by the death of Mr. John Clayden, and the vacancies caused by the previous elections have been filled by the election of the Hon. Wilbraham Egerton, M.P., of Rostherne Manor, Knutsford; and Mr. James Rawlence, of Bullbridge, Wilton, Salisbury.

The half-yearly statement of accounts to the 30th of June, 1871, has been examined and approved by the Society's auditors and accountants, and has been published for the information of the members in the last number of the *Journal*. The permanent funded capital of the Society remains the same as at the last half-yearly meeting, namely, £20,000 New Three per Cents., but the Reserve Show-fund has been reduced by the sum of £500, and therefore now stands at £4,112 7s. 8d.

The financial results of the country meetings at Oxford and Wolverhampton having been a loss to the Society of about £4,000, owing chiefly to the extensive and costly nature of the trials of implements, the Council have appointed a special committee to consider the whole question of the receipts and expenditure of the Society, and the possibility of securing equal results at less cost.

The extensive nature of these trials also presses with great severity on the local committees in years when land has specially to be hired for the purpose. The Council have therefore resolved that when the trials of implements at the country meetings are not held in the show-yard, one-half of the expense of providing trial-fields shall in future years be borne by the Society; but to enable the Council to know the extent of its engagements it has been stipulated that the competing localities shall state the maximum cost of the land required for the trial of implements, the acreage wanted being furnished by the Society.

The Wolverhampton meeting was distinguished from previous exhibitions of the Society by the extensive trials of steam cultivating machinery and traction engines, full reports on which have been furnished to the members in the last number of the *Journal*. Notwithstanding a long continuance of unfavourable weather, the Council are able to congratulate the Society on the practical results of these trials. They have pointed out to the agricultural communities the best combinations of machinery for the cultivation of the land by steam-power, not only by the medium of the most powerful sets of tackle, but also by means of less expensive machinery within the reach of individual farmers in districts where no system of hiring is in force. The competition for Lord Vernon's Prize-cup, offered for a set of machinery not to exceed £700 in cost, and that for the Society's prizes for sets of tackle in

which the weight of the engine was restricted, as well as for others to be driven by ordinary portable engines, produced results which will be practically useful to farmers of every class who may be desirous of cultivating their land by the aid of steam.

The trials of traction-engines were an entirely new feature, and the exhaustive report of the Engineer Judges has placed on permanent record the valuable additions which they made to our knowledge of the principles of steam-traction on common roads, and the inferences which they suggest to the practical engineer.

The competition for the prizes offered in the section of hop-machinery was not so extensive as the Council had hoped to excite, but this disappointment has been to a great extent overcome by the fact that the trials exposed to exhibitors and other implement makers many striking defects in the existing machines.

The exhibition of Live Stock did not in some cases equal that of last year, but the show of Shropshire Sheep was the largest that has ever been held under the auspices of this Society. The liberality of the Local Committee in offering Prizes for numerous additional classes of Horses did not meet with an encouraging response from exhibitors, but it is to be feared that the charges for conveyance by the railway companies have a very prejudicial effect on this department of the Society's Show. Although the Council have frequently endeavoured unsuccessfully to obtain concessions from the railway companies for the conveyance of Live Stock, and more especially of Horses, they have recently placed themselves once more in communication with the railway authorities with this object in view.

The Farm-prize competition in connexion with the Wolverhampton Meeting excited great interest in the counties of Shropshire and Staffordshire, as well as in other parts of the kingdom. A full report on the successful farms, written by Mr. Wheatley, one of the judges, has been published in the Society's *Journal*, and it is hoped that it may aid in producing results commensurate with the liberality of the landowners in the two counties in offering the first prizes, the enterprise of the competing tenant-farmers, and the careful investigation of Mr. Wheatley and his colleagues.

The series of Farm-prize competitions will be continued next year, a silver cup, value £100, having been offered by the President of the Society (Sir Watkin W. Wynn, Bart., M.P.), and a second prize of £50 by the Council. These prizes will be awarded to the two best managed farms in South Wales and Monmouthshire which shall conform to the following conditions.

- 1.—That they are not less than 100 acres in extent.
- 2.—That not less than one-fourth of the land (not including sheep-walk) is under tillage.
- 3.—That they are held (a) by a tenant-farmer paying a *bona fide* rent for not less than three-fourths of the land in his occupation, or (b) by a landowner occupying his own farm, the total extent of whose property in agricultural land (exclusive of sheep-walk) does not exceed 200 acres, and whose sole business is farming.

Nineteen farms have been entered to compete for these prizes.

The implement prize-sheet for the ensuing country meeting to be held at Cardiff has received the careful attention of the Council; and prizes have been offered for portable steam-engines, thrashing machines, straw and hay elevators, corn serecons, corn dressing machines, and seed drawers. The regulations of the trials and the instructions to the judges have been revised, especially in reference to the points representing perfection in thrashing machines: and further restrictions have been imposed on exhibitors with a view of keeping the exhibition of implements within moderate limits.

The regulations affecting the awards of medals to miscellaneous articles have also been once more under the consideration of the Council, and such modifications of them have been introduced into the Cardiff prize-sheet as will insure that the medals are awarded either to implements belonging to the classes to be tried at that meeting, or to those which have an entirely novel construction, and which are not included in the Society's classification.

The Council have renewed the education grant for the year 1872, on the same conditions as were attached to the examinations this year, feeling that more time must elapse before the advantages arising from success at these examinations can be generally appreciated.

Since the commencement of the publication of the quarterly reports of the consulting chemist, the number of analyses made by Professor Voelcker have increased during 1871 by 150 in excess of those made in 1870, and 265 over those of 1869; and the Council are satisfied that the publication of these quarterly reports has caused agriculturists more to appreciate the value of chemical research, and has aroused a spirit of inquiry in this department of agriculture, which cannot fail to produce very satisfactory results. They trust, therefore, that the continuation of the publication of these reports of the consulting chemist may not be less advantageous to the members of the Society than they have hitherto been.

The Council have to announce that they have appointed Mr. W. Carruthers, F.R.S., chief of the national botanical collection of the British Museum, to be the consulting botanist to the Society. In making this appointment the Council have endeavoured to secure the services of a competent botanist, whose duty it will be to examine plants, seeds, &c., for the members of the Society; to report on the principal work performed by him during each year; and from time to time to furnish papers to the *Journal* on special subjects of botanical interest. The following schedule of charges has been provisionally fixed by the Council for the examination of plants and seeds for the use of members of the Society:

No. 1.—A general opinion as to the genuineness and age of a sample of cloverseed (each sample)	5s.
2.—A detailed examination of a sample of dirty or impure clover-seed with a report on its admixture with seeds of dodder or other weeds (each sample)	10s.
3.—A test examination of turnip or other cruciferous seed, with a report on its germinating power, or its adulteration with 000 seed (each sample)	10s.
4.—A test examination of any other kind of seed or corn, with a report on its germinating power (each sample)	10s.
5.—Determination of the species of any indigenous British plant (not parasitic) with a report on its habits (each species)	5s.
6.—Determination of the species of any epiphyte or vegetable parasite, on any farm-crop grown by the Member, with a report on its habits, and suggestions (where possible) as to its extermination or prevention (each species)	10s.
7.—Report on any other form of plant disease not caused by insects	10s.
8.—Determination of the species of a collection of natural grasses indigenous to any district on one kind of soil (each collection)	10s.

The prevalence of foot-and-mouth disease in English herds has induced the Council, on more than one occasion during the past half-year, to draw the attention of the Government to the existing regulations in reference to the importation of both foreign and Irish cattle, and to

the restrictions which it is desirable to impose in order to diminish the risk of their conveying contagious or infectious diseases to English stock. The correspondence between the Veterinary Department of the Privy Council and the Secretary of the Society, together with a *précis* of the various acts and orders in Council relating to the importation of foreign animals, has been published in the last number of the *Journal*; and, with regard to Irish stock, the Council have received the assurance of the Government that measures are being taken which, it is hoped, will be found satisfactory.

The existence amongst lambs of a wide-spread disease of home origin, has been brought under the notice of the Council by the Lincolnshire Agricultural Society, during the past half-year. The nature and origin of this disease have been previously described in the *Journal* of the Society, but in view of the great losses which it has this year caused to Lincolnshire flockmasters, the Council have requested Professor Shirds to make a thorough and immediate examination of the nature of the disease and the circumstances under which it most commonly occurs, and to give suggestions for its treatment and prevention.

The relations between the Royal Veterinary College and the Society are still under discussion by the governing bodies of the two institutions; but the Council are still hopeful that the result will be to extend the usefulness of the veterinary department of the Society in accordance with its increasing importance to the English agriculturist. In consequence of the death of Professor Spooner, the post of principal of the Royal Veterinary College is now vacant; and it is possible that alterations may be made in the staff and course of study at the College. Under these circumstances the Council have postponed its decision on the relations of the Society to the College.

By Order of the Council,
H. M. JENKINS, Secretary,

The CHAIRMAN said it would be seen from the Report that the number of members was increasing, and he trusted the Society would continue to prosper. The financial results of the Wolverhampton meeting were not quite as successful as could be wished; but it was impossible to provide suitable ground for the trial of the steam ploughs without incurring enormous expense. In agriculture, as in other things, everything had now to be carried on upon a large scale when the object was to ascertain experimentally how the greatest results might be secured at the smallest cost. He believed that the money expended at Wolverhampton had been well laid out; that the effect was likely to be appreciated throughout the country, was shown by the fact that the tenant-farmer in Stafford, on whose farm the steam trials took place, had purchased the set of Fowler's steam tackle which won Lord Vernon's prize. There was a man who, having seen the advantages and disadvantages of the machinery employed, was led to become its purchaser, and there could be no better proof of its value. They must all regret that the weather during the Wolverhampton week was such as to prevent many of those who were called holiday folks or sight-seers from attending the Show. Having been present himself he could declare that he never saw ground in a heavier condition, or more difficult to get across. He wished to lay before the meeting a few interesting facts connected with the question of the adulteration of manures, the information having been supplied by Dr. Voelcker. In 1871 Dr. Voelcker made 730 analyses for members of the Royal Agricultural Society, amongst which were 78 guanos, many of an inferior character, and not a few adulterated; 202 superphosphates, bone manures, and other artificials; 36 samples of bones; 31 refuse matters, such as shoddy; 31 nitrate of soda; 212 oilcakes; 24 feeding meals. Manures sold at £5 were found to be worth only 10s. a ton, and others worth the cartage to the field. Some of the oilcakes caused the death to valuable animals, and were found to be mixed with

downright poisonous substances. Since the publication of the quarterly reports of the Chemical Committee the number of analyses for members has increased nearly by 300, and in the last five years the analytical work has been more than doubled. He might add, with regard to the law-suit in which the Society had been engaged during the past year, and which ended in a compromise, that the Council did not stop because they were at all inclined to shirk their duty, but because Counsel thought it advisable that they should do so. The question of railway accommodation for the country meetings of that Society was one of great difficulty, though, generally speaking, the railway companies with whom they had had to deal had been enabled to recoup themselves for any additional outlay by increased traffic. After that meeting had terminated he was going to Paddington, with the Secretary, to see whether better arrangements than those adopted recently could not be made for the meeting at Cardiff. One word with regard to foot-and-mouth disease which now prevailed so extensively throughout the country. The officers of the Society had been in communication with the Committee of Council on that subject, and the question was under the consideration of the Council meeting held last month. The condition of the Irish boats employed for the conveyance of cattle had been under their consideration. It was their wish that those vessels should be examined in the same way and subject to the same conditions as regards cleansing and disinfection as foreign ones, and he hoped that the Government authorities would give directions to that effect. Trusting that the meeting would excuse him for having taken up so much time, he would now remind those present that they might introduce any subject that was connected with this report which was consistent with the charter and not political (cheers).

Mr. W. BOTLEY, in moving the adoption of the Report, said that after the excellent prefatory remarks of the Chairman it could not be necessary for him to say much in performing that duty. The Report seemed to him, on the whole, of a very satisfactory character, and, as regarded the two or three subjects for regret, no fault rested with the Council; while, if they were not so successful in a pecuniary point of view as could be desired, the £20,000 invested in Government securities, as reported at the last half-yearly meeting, still remained intact. The opening paragraph of the Report showed that they had good cause to congratulate each other on the increase in the number of members. Some time ago it was remarked that the number of members ought to be at least doubled, and he entirely concurred in that opinion. There was, however, a steady improvement in that respect, and considering, among other things, how much more readable the *Journal* had become than it was a few years ago, and how many articles it contained of great general interest to farmers, he could not doubt they would continue to improve (cheers). As regarded the prizes for hop machinery, he might remark that as that was quite a new feature it was not to be expected that the result would be more satisfactory. No one could have read the accounts given in the *Journal* of the prize farm competitions without feeling that the results were exceedingly satisfactory, and it was clear that the prizes offered for the best farming tended greatly to the advancement of agriculture. Several years ago he advocated the encouragement of education among farmers by that society, and he was glad to find that the Council had renewed the education grant for 1872. Having recently seen some of the results of sewage irrigation on the farm at Aldershot, and on another farm, he must say they were most extraordinary. On the 4th of November he saw men cutting rye grass for the fifth time this year at the rate of 16 tons per acre, and it appeared that on some of the best parts of the land which he saw no less than 90 tons of rye-grass had been cut within the present year. The land also produced excellent carrots and potatoes, and out of seven acres of the latter there were only about three bushels diseased. The cost of that kind of cultivation was necessarily very great, the manager of one of the farms which he visited stating that it amounted to about £40 per acre; but, notwithstanding that large expense, the results were remunerative.

Professor COLEMAN, in seconding the resolution, said he considered the Report to be most satisfactory, as showing that the members of the Council were anxiously endeavouring to keep the Society up to the mark in the progressive age in which they lived (Hear. hear). The recent financial loss has no doubt in one sense to be regretted, but, on the other hand,

he believed that the money expended on the shows was admirably laid out, and conduced to the advantage of agriculture and of the country. He trusted the Finance Committee would not feel discouraged even if the next show entailed some loss, and he felt certain that the approaching meeting at Cardiff would leave its mark behind in the Principality (Hear, hear). He congratulated the Society on the liberal and handsome prizes offered by Sir Warkyn Wynn, as a continuation of that new feature the farm prizes (cheers). Considering that Cardiff was—he did not wish to use these words disrespectfully—somewhat out of the world, he thought that feature would be a matter of special interest at the meeting. He attached great value, in a practical point of view, to the reports on the farming competitions which appeared in the Society's *Journal*.

Sir J. H. MAXWELL could not help congratulating the Society on the course pursued by the Council with regard to the adulteration of manures, the great object being to protect tenant-farmers against sham guano merchants. There would, of course, always be both rogues and fools in that case as in others, but he was happy to say that the number of respectable guano dealers and manure importers were increasing, and he believed that that, combined with the action of the Council, would put an end to an evil which had been a very serious one to the cause of agriculture.

Mr. NEILD would have been glad if the financial statement had shown how much of the £4,000 loss was incurred at Oxford, and how much at Wolverhampton. He thought that each show should stand on its own merits, because in the one case there were natural causes, and in the other there were causes which had often been in his own mind to account for the loss. He knew he was on delicate ground when he mentioned anything approaching trials of horses, and that he should be exceedingly at fault if he spoke of leaping prizes; but one thing which must commend itself to that Society was the result of the judicious and practical course pursued in that respect at Liverpool. At the Liverpool show there were trials of both driving and draught agricultural horses, and the greatest interest was manifested. He was forcibly impressed with what was said in the Report respecting the adulteration of manures and of cattle food. He believed that if ever the day arrived when farmers had fair-play with regard to malt, and could feed their stock with malt of their own growth without its being taxed, that change would sweep off, as it were, half the remaining adulteration, while it would at the same time confer great benefit on the community in general. He believed that if malt were made free to the farmer, the price of beef would be 1d. per lb. lower within a twelvemonth. As to the railway arrangements for Wolverhampton, he must say that their niggardly and beggarly character seemed to him a disgrace to that part of England. The result of such a state of things might be that that Society would presently be compelled to hold all its meetings in two or three central places; but he congratulated the meeting on the prospects of the Cardiff meeting, and would add that his Welsh friends had assured him that it would be a bumper.

Mr. ARKELL would suggest that in future farmers should send all the particulars to the secretary, stating of whom they purchased manures, the cost price, and so on, and that the sample should be handed over to Dr. Voelcker for analysis without his being told where it came from or anything which could tend to prejudice his mind. He feared that it was only in that way that the practice of adulteration could be exposed to the full extent required; and he hoped, therefore, the Chemical Committee would take his suggestion into consideration. As a rule rogues were very bold and honest men very timid (laughter). The last paragraph but one in the Report referred to the wide-spread disease among lambs. On that subject he had to suggest the appointment of an entomologist. It was agreed on all hands that the disease which prevailed among lambs, as well as among horses, was caused by a small red worm in the gullet and pipe. The existence of that worm could be easily discovered by a veterinary surgeon, but an entomologist was required to trace out the cause. There was great difference of opinion as to whether the worm was picked up on the land, in sheds and stables, or by over-feeding; but farmers had to cultivate their land and produce stock at great expense, and when they got to about seventy they knew how to live (laughter). He well recollected reading the articles of Mr. Curtis in some of the earlier numbers of the *Journal*

with regard to the various insects which destroyed crops; but after Mr. Curtis' death that subject went to the dogs; there had been nothing worth reading since, and he thought the labours of an entomologist would prove of great service to agriculturists. At present no one seemed to know how the parents of the worms got into the pipes of lambs. He hoped the Council would deal with that question in such a manner as to entitle them to increased confidence from farmers as a body.

The Report was then adopted.

On the motion of Col. Challoner, seconded by Mr. Kimber, a vote of thanks was given to the auditors.

Mr. TORR, in moving the re-election of the auditors, said the expenditure on the steam trials at Wolverhampton seemed to him perfectly justifiable. Such trials inevitably cost the Society a large sum of money. They could not work steam machinery with hundreds, but must spend thousands upon thousands. A paragraph in the Report referred to the prevalence of disease among lambs in Lincolnshire. He himself had lost 100 lambs; but that was a mere fraction of the aggregate loss. The disease had extended to almost every county in England, and must not be regarded as having a special tendency to develop itself in Lincolnshire. Having been instrumental in bringing the subject before the Council of that Society, on the previous day he formed part of a deputation of six or seven Lincolnshire farmers who had an interview with Professor Simonds in relation to it. In that interview the Professor gave them an elaborate, sensible, and clear definition of almost every worm in existence, and told them how they affected sheep; and when he (Mr. Torr) had returned home he was to send him some of the grasses and of the earth in which those worms existed in a parasitic form. It was difficult to find out their haunts, as they were on some farms continually and on others only occasionally; but the Professor thought that they existed in a parasitic form in winter, and reappeared in the spring. He also said that they were taken up by lambs in such minute forms that they could hardly be discerned even with the aid of a microscope. Their existence was known, but the great object was to trace them out, and to begin early enough in the spring to detect them where they existed as parasites ready to develop themselves into the worm, so that the worm would become an animate instead of a dead substance. Such was the great object of inquiry; and as the Council of that Society had been liberal enough to make a grant for the expenses, he would engage that in Lincolnshire they would lose no time in doing their part towards discovering the source of the evil, acting on the broad principle that while benefiting themselves they would also benefit the nation.

Mr. LIDDELL, M.P., having seconded the motion, it was put and carried.

The CHAIRMAN having then, in conformity with custom, invited the members present to offer suggestions for the consideration of the Council,

Sir J. H. MAXWELL wished to say one or two words in allusion to the regret expressed that the members of that Society were not more numerous. At the last meeting he observed that he thought the Scotch Society had succeeded better in that respect, and that there was a large proportion of tenant-farmers. In order to obtain definite information on that point he had written to the excellent secretary of the Society to which he referred, and he would read the following extract from the reply: "In 1850 we had only 2,700 members on our list, only 239 of those being tenant-farmers, nearly all of them life members. In that year it was resolved that tenant-farmers should be admitted on a subscription of 10s. per annum, or £5 5s. for life, instead of £1 3s. 6d. per annum, or £12 12s. for life—the ordinary rate. The number of tenant-farmers is steadily increasing. We have now 4,033 members of all classes, and 1,784 of these are tenant-farmers. In 1861 we had 1,541 tenant-farmers; in 1866, when I became secretary, we had 1,684; and in 1871 we have 1,784. I have no doubt it has benefited this Society as well as the country, reducing the subscription to tenant-farmers; so much so that I have induced the Society to add a number of other classes to the same list."

The CHAIRMAN said he understood Sir John to throw out the suggestion that the Council should consider whether any means could be devised for popularizing the Society a little more.

Sir J. H. MAXWELL: Yes.

Mr. WELLS said as chairman of the Chemical Committee he wished to remark that he had felt great pleasure in listening to what had been said respecting the analyses made for the members. He must confess that he had been a little afraid lest they should be rather severely criticised at that meeting on account of the legal expenses which had been recently incurred (No, no). If mistakes had been committed it was certainly through no want of industry or care on the part of the committee. There had generally been very full meetings; everything had been done by them which seemed likely to ensure success; and he was glad that the course which they pursued met with the approval of the members. Mr. Arkell's suggestion should have due consideration, but he thought there would be some difficulty in the sending of manures in the first instance to the Secretary instead of Dr. Voeleker.

Sir G. JENKINSON, M.P., alluding to what had been said respecting the number of members, said that he himself had pointed out to tenant-farmers the advantages arising from membership, especially as regarded early admission to the exhibitions, and he believed that if others pursued a similar course, that would lead to an accession.

The SECRETARY wished to observe that the proportion of tenant-farmers to other members was far larger in the case of that Society than in the case of the Highland Society, and that the members of the latter were not entitled like those of the former to the privileges of chemical analysis without any addition to their annual payment.

Sir J. H. MAXWELL, in moving a vote of thanks to the Chairman, said he was always glad to see an old agricultural name connected with the Presidency of that noble Society, and expressed a hope that Sir Watkin would witness a great success at the approaching meeting in Wales.

Col. CHALLONER, in seconding the motion, spoke of the care and attention bestowed on the Society's affairs by the Chairman ever since he became President.

The motion having been put by Sir J. H. Maxwell, and carried by acclamation,

The CHAIRMAN, after returning thanks, said it was not to be expected that the Cardiff Show would bring as large an attendance as some others had done, as it would not be in so central a position; but it would be held in a very important part of Wales, and would he trusted prove satisfactory. It was very important to show how the largest amount of food could be grown on the smallest extent of land. There was a large class of men in Wales who farmed their own land, as their ancestors had done for generations, and who were very little removed in point of income and capabilities above tenant farmers, and he had suggested that such persons should be allowed to compete on the same conditions as others, not intending to include in that privilege those who farmed merely for amusement. He was very glad to hear the suggestions which had been made that day, particularly those that chiefly concerned the Chemical Committee, which had been engaged in exposing those who had for years been in the habit of—he would not blink his meaning—robbing the farmer. They all knew that the farmers of England were a little too fond of buying in the cheapest market. It was the business of the Council to try and protect them; and although in endeavouring to do that they had incurred a loss of about £600 in the case which had been mentioned, yet he did not grieve from what he had heard that the meeting disapproved of the manner in which the Society's money had been expended.

The meeting then separated.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

At the December meeting of the directors, Major Ramsay, and afterwards the Marquis of Tweeddale, in the chair—

The board agreed, on the suggestion of the Chemistry Committee, to offer a premium of £50 for a report on "What has Chemistry done for Agriculture by Improving or Increasing the Produce of the Soil?" A suggestion originating from the Chemical Committee that the Society should establish a model farm was remitted to the committee, their proposal not being yet matured.

The report by the Committee on the Transit of Animals by Railway was submitted. It embodies the whole proceedings of the Society from the time the subject was first taken up by the directors in 1867, and proceeds as follows: "After carefully considering the documents submitted, and the Act to which the Order of Council has reference, the committee beg to recommend that the board should again communicate with the Lords of the Privy Council, through Dr. Alexander Williams, specially pointing out—1. That the Order of Council (300) called "The Transit of Animals Order of May, 1870," for providing trucks with spring buffers and supplying water to animals carried by railway, is not only systematically evaded, but is defective in respect that provision is not made for supplying animals with food; and that a new Order of Council is urgently called for. In the new Order it should be specially provided—(1) That animals should be supplied with water when trucked and untrucked; and during the journey both with food and water. The necessary food to be provided by the owner of the animals, the water by the railway company. The Act says that if animals are allowed to be in trucks without water for a period between twelve and thirty hours (to be fixed by the Privy Council), the railway company will be guilty of an offence. A rule of the same kind should be adopted for food against the owners. (2) That in addition to the spring buffers stated in the Order of Council (300), it is absolutely necessary to provide covered waggons, closed at the ends, and 18 inches along the sides from each end, with an arrangement of troughs for the proper supply of the animals with water, and racks for supplying hay in the trucks during the journey. II. That many important railway stations where animals are trucked and untrucked are not included in the schedule at-

tached to the Order of Council (324) called "The Transit of Animals (Water) Order of March, 1871." (Here follow the list of additional stations suggested; but the committee consider that should the Privy Council issue an order that water be supplied in the trucks, it will not be necessary to have it at all the stations enumerated). The committee further suggest that should the Privy Council not give effect to the representations proposed to be made to them, an influential deputation should be formed to wait on their Lordships. The report was approved of by the directors.

The following report upon the trial of Fiskens steam cultivating machinery, which took place on the Marquis of Tweeddale's home farm of Yester Mains during the week ending 11th November last, prepared by Mr. Swinton, Holywell Bank, Gifford, was submitted to the board:—

Lord Tweeddale being desirous to see this system of steam cultivation at work, and to give the agricultural community an opportunity of inspecting it, arranged with the Ravenshorpe Engineering Company of Mirfield, near Leeds, to send the patented part of the machinery to Yester, and hired from Mr. David Roughead, Myreside, a traction engine and balance plough, made by John Fowler and Co., of Leeds. This engine is stated by Messrs. Fowler and Co. to be of fourteen horse-power, but several practical engineers who saw the engine at work expressed doubts about the engine being of this power, and the price paid by Mr. Roughead for it (£420) indicates a smaller horse-power, although Mr. Roughead states he got a good bargain of it. Mr. Roughead has used this engine for over three years, in working a set of roundabout tackle on Howard's system. The only alteration which this engine required in order to adapt it to the Fiskens tackle was the fixing of a grooved rim on the flywheel to receive the driving rope. The plough hired from Mr. Roughead was one of Fowler's ordinary balance four furrow ploughs, but with mould boards made according to a pattern of Mr. Roughead's. This plough was only adapted for a furrow not exceeding 9 inches deep, and had to be considerably altered to enable it to turn a 14-inch furrow. This it did not do very satisfactorily, and a trial was made to fit on mould boards of the common horse plough in use at Yester, but as the head of the plough and the mould

board were not adapted to each other, the furrow was not so well turned as it might have been. The Fisken tackle is not, however, in anyway answerable for deficiency in the quality of the ploughing, as this was wholly the fault of the plough. The field to be ploughed contains 75 acres, and had been under a crop of oats in 1871, and was wished to be deep ploughed in preparation for a crop of turnips in 1872. The part of the field operated on consisted of soil of various kinds, from stiff clay to sand and gravel, and a narrow hollow or glen passed through it into which the plough had to descend and ascend at each turn across the field. This part of the field was chosen in order to test the working of the machinery on uneven land. The field had during several previous rotations, been ploughed by horses to a depth of from 14 to 16 inches and all the large stones removed. A full description of the Fisken method of steam cultivation is given in the pamphlets issued by the patentees and makers of the apparatus and need not be here repeated. The Fisken tackle, consisting of 2 patent windlasses, 6 corner anchors, 1 tension anchor, 30 light rope porters, 2 claw anchors, 2 rope porters for steel rope, 2 wood levers, crowbars, and tools, 1,200 yards of hemp driving rope, 800 yards steel rope, 100 yards steel rope for anchors, and weighing in all about 8½ tons, arrived at Had-dington Station on Saturday, 4th November, and required 9 horses and 2 carts to convey it to Yester, six miles. The windlasses were set down in the field near their position for work, and a portion of the field 400 yards long and 200 yards wide, and containing about 16 acres, was marked off, and the anchors and porters for the driving rope were set up round about it. The engine and plough arrived in the field on Monday, November 6, and about three o'clock on the afternoon of that day commenced to plough. Several hours were spent in getting the engine into position, in consequence of the wheels having sunk in the soft headland, which was very wet from the heavy rains on the previous days. Tuesday, 7th November, was spent in making sundry alterations on the plough, and adjusting some parts of the Fisken tackle which had not been properly fitted. Wednesday, 8th November, the tackle was fairly started this morning, and the number of people employed was as follows:—1 engine-driver, 2 windlass men, 1 ploughman, 1 lad at wire rope porters, 1 man and horse driving water to engine, 1 man and 2 horses driving coals (eight miles). Not long after the starting the bearing of the pulley of the corner anchor, nearest to the engine on the tight rope, became heated, and the anchor had to be removed and another one substituted. About three hours after starting, the small pinion on the first motion of the patent windlass stuck fast on the shaft on which it runs loose when not in gear. The work had to be stopped and part of the machine had to be sent to the blacksmith's shop to be adjusted and the shaft ground, thereby causing a delay of three hours. Both of these stoppages occurred through sufficient provision not having been made for lubricating the bearings, and can be very easily remedied. With the above exceptions, no faults or deficiencies were observed in the patent tackle while at work at Yester. It was, however, remarked by several persons conversant in such matters that the bearings of the corner anchors, and also of the patent windlasses, would be improved by being lengthened, so as to spread the pressure over a greater surface; and that better provision for lubrication was required, as most of the bearings are vertical. Lord Tweeddale having required the land to be ploughed 14 inches deep, which is the depth ploughed by three horses at Yester, the balance plough was altered accordingly, so as to plough three furrows of the required breadth and depth; and although the land was not so well turned as was desirable, still the soil was moved to the depth required, except where the land was light and gravelly on the slope of the glen or hollows, where the tendency of the plough was to throw out of the ground. On several occasions, and in order to test the strength of the tackle, the plough was loaded with men and forced into the stiff clay so as to stop the engine. No breakages occurred. It was found that with three furrows 14 inches deep, one hour was required to plough an imperial acre, with the steam gauge of the engine, showing a pressure of eighty pounds of steam per square inch. On Saturday, 11th November, the work was inspected by the Directors of the Highland and Agricultural Society, the Steam Plough Committee of the Society, and several other gentlemen. The registering dynamometer of the society was in the field, but in consequence of

the non-appearance of Mr. Slight till late in the afternoon there was not sufficient light properly to apply the dynamometer. This is much to be regretted, as there is no record of the power expended in dragging the plough, or the driving rope and windlasses without the plough. At the desire of the directors the tackle was removed and set to work in a different part of the field. The engine moved itself to its new position. Three horses were required to move the windlasses, and two horses and carts to move the anchors, porters, and other apparatus. The time occupied in this removal was one hour and thirty-five minutes from the time of commencing the removal till the plough was again at work. Some delay was caused by the coiling up of the hemp-driving rope on the reel, which, instead of being on the engine (its proper place), was temporarily fixed on a cart. The engine driver, who has had charge of Mr. Roughhead's engine for the last three years, states that the power required from the engine to drive the Fisken tackle is as near as possible the same, and certainly not more than is required to work the tackle on Mr. Roughhead's farm, and that the consumption of coal and water was also the same. The engine was found to consume 2½ cwt. of coal and 16 cwt. of water per hour. The coal was got from Fountainhall colliery, and though not of the best quality of steam coal, is the coal commonly used for engines in this part of the country. The oil and tallow required for the lubrication of the windlasses, anchors, and porters, after these got into proper working order, was 1 imperial pint of sperm oil per day, and about 1 pound of tallow per week. The working strain on the hemp-driving rope is said to be a fourth part of the strain on the wire rope which drags the plough, so that, supposing the strain on the wire rope with the plough turning 3 fourteen-inch furrows to be 25 cwt., the strain on the driving rope would be 2 cwt. The driving rope when new will stand a strain of 20 cwt., and the wire rope 14 tons. The working of the Fisken tackle during the week it was employed at Yester was very closely watched, and after the tackle was fairly started, notes of everything that occurred were taken. The only defects observed in the tackle were those already mentioned. They were easily remedied, and with a little more care in manufacture would not have occurred. The management of the windlasses is apparently within the capacity of any ordinary working man, and the facility with which these can be put into and thrown out of gear, and the plough thereby stopped, without communication with the engine driver, seemed to have reduced the danger of any accident almost to a minimum. The use of the friction clutch for setting the windlass in motion is also considered a great advantage, as the risk of breakage from the plough coming in contact with setfast stones, is much reduced. The tackle was examined by many practical agriculturists during the week, and they were unanimous in expressing their approbation of the apparent suitability of the tackle to perform the work required of it. It is to be hoped that the eminent consulting and practical engineers of the Highland Society will express their opinion as to the mechanical arrangement adopted on this system, and as to the probable endurance of the windlasses and other parts of the machinery. No statement of the cost of working the Fisken tackle has been given here, as this must vary very much according to the rate of wages paid in different parts of the country, and the distance from coals and water. Nor has any comparison been made as to the economy or advantage of this system in comparison with any other, as there has not been sufficient experience of it to warrant any such comparison. An attempt was made to have another system of steam cultivation at work in the field, in order to contrast this system with another, but in consequence of the conditions laid down by the agent of the other system, it was found to be beyond the means of a private individual to conduct such a trial as he insisted on, and Lord Tweeddale is of opinion that such a trial could only be carried on in Scotland by the Highland and Agricultural Society.

The board instructed the Secretary to convey the thanks of the Society to Mr. Swinton for his able report, and to communicate with Professor Macquorn Rankine and Mr. Slight, with the view of getting a report from them of the mechanical arrangement, and to the probable endurance of the windlasses and other parts of the machinery adopted in Mr. Fisken's system.

A committee was named to read and report on the papers

ldged for Lady Burdett Coutts' prizes for essays on the most efficient method of inculcating in primary schools the duty of humanity to the lower animals. Mr. Menzies reported the forty-three essays had been received.

A communication from the Secretary of State for India, addressed to the president, requesting the Society to forward direct to the Government of India such papers and information as may be published by the Society so soon as they are

issued, and also to direct the attention of the Government of India to such points as may be deemed useful for them to be acquainted with, was laid before the board. The secretary reported that a similar application had some time since been made for the Transactions on behalf of the agricultural department of the India Government of Calcutta, and that a complete set of the new series had been forwarded in November last, which had been reported to the India board.

THE LAND QUESTION IN WALES.

At a meeting of the United Counties Chamber of Agriculture held at Carmarthen, Mr. J. L. G. P. Lewis, of Henllan, in the chair,

Mr. B. T. WILLIAMS, M.A., of the South Wales Circuit said: In coming here to address you, the landowners of these counties, upon the land question, I feel that I occupy a position in which I must claim your indulgence. I tread upon dangerous ground.

Incedo per ignes
Suppositos cineri doloso.

But while I claim from you full liberty to express my opinions, however much they may differ from your own, I promise you impartially to consider the views which you will advocate after I have done. The political writers, who are now seeking to direct public attention to what is termed the "Land Question," may be divided into the usual two classes of extreme and moderate. The views of the extreme class imply either the confiscation of all rights of private property in land, or the purchase by the State of such rights for the benefit of those who have no land at present. Those views are mischievous because they instil into the minds of the working classes notions that they may make themselves rich by political agitation, whereas all that the State can do for any class in this country, is by destroying monopolies and favouritism, to give it a fair chance for the exercise of its skill, enterprise, and virtue. Their views are also impracticable and need not therefore be discussed by me here. English common sense will never sanction confiscation, and is not likely to adopt its modified form of purchase by the State, which, in truth, means the enrichment of one class out of the pockets, although indirectly, of another. The views of the moderate school are put forward by Mr. John Stuart Mill and his Land Tenure Reform Association. Their programme contains some suggestions that are good and well worthy the attention of law reformers. It also contains others that are unjust and dangerous. Mr. Mill's treatise upon the land question is well worthy of a moment's consideration, not only on account of its distinguished authorship, but also because it is fairly indicative of the plan of reform which is now urged upon the attention of the people by a school of reformers. There are one or two points in their programme about which you, as well as myself, may justly have some hesitation. It is rightly assumed that land increases in value every year. Now, Mr. Mill thinks that as a great part of this increase is due not to any effort or outlay by the proprietors, but merely to the growth of population or wealth, it should be intercepted or secured for the benefit of the State. When this principle is to be applied to landowners, Mr. Mill is good enough to suggest that if they do not wish to submit to it, they may be allowed to relinquish their property to the State at the market value acquired at the time. This appears to me the most unjust and impolitic proposal that has been submitted to the people by a public man for many years. Railway shares, consols, and all properties of which a man may be possessed, may and frequently do rise in value without any effort or outlay on his part. The likelihood of this taking place is the reason why he invests in some securities in preference to others. Above all men the landowner, especially if he is a poor man, submits for years to the inconvenience of poor returns, often at a miserable interest of 2 per cent., in the fond hope that in future years his children by the increase of the value of his estate will be repaid for his self-denial and forethought. If this principle is to be applied to any investment, why is it not applied to all? Further, if the State takes the profit, will it also take the loss? "Qui

scilicet commodum sentire debet et onus" is a maxim of our law and of universal justice. A landowner, after the efforts and outlay of years, may find his estate diminished in value. He may discover his plans fail. The flow of wealth may be directed to other districts. It is only a just part of the bargain that the State should pay him for his loss if it is to stand by, waiting to seize any increase in his profits. If such a proposal were ever adopted, it would check enterprise and stop improvement by taking away the strong incentive to both. It is patent, therefore, that it is as impolitic as it is unjust, and I think I may also say that it is as impracticable as either. I will not refer to the alternative of selling their land to the State, which Mr. Mill is good enough to offer to those landowners who refuse to submit to this injustice. The State has no right to compel a man to adopt a course which he does not voluntarily select by threatening to do him a wrong. The next proposal made by Mr. Mill to which I shall refer, is that all waste lands and commons that require an Act of Parliament to authorise their enclosure shall be retained for national uses, compensation being made for manorial rights and rights of common to those who are now entitled to them. This proposal is made for a good object. The land that is actually lying waste in this country ought to be made productive. The nation with its millions struggling for bread cannot afford to allow means of profitable employment and of increased wealth to lie undeveloped. If Mr. Mill had inaugurated a movement for the compulsory enclosure of commons, he would have done a good act. As matters now stand, the enclosure of commons is a cumbersome and expensive proceeding. Rights in some districts are supposed to be imperfectly ascertained, and a fear of legal dispute encourages delay. Consequently, a person is not easily found who will take the initiative in the enclosure of commons. The result is, that notwithstanding our surplus population and the high price of land, large tracts of country are allowed to lie useless and unproductive. If Parliament took this matter up with a strong hand, and made the enclosure of commons obligatory throughout the United Kingdom of Great Britain and Ireland, a new and large field of industry, enterprise, and investment would open up before the people. But there is a fallacy and also a wrong in Mr. Mill's word "retain." The commons and waste lands of the country are not now vested in the State, and are not the property of the State, but of the various lords of manors, and of those who have rights upon the same. If the State wishes to possess itself of the commons and waste land she must buy them of their present proprietors at a cost which with reference to their present value and future contingencies may be just. This suggestion and some others to which I need not refer are based upon the desire that Mr. Mill and his friends have to increase the class of small proprietors. How far is this desirable? How far is it possible? I have no hesitation in saying that the interest of the nation is greatly concerned in preserving the race of small landed proprietors. The country has so far supplied England with its best men—with those who were strongest in mind and body, and bravest in heart. If I belonged to the Conservative party, I should watch with jealousy and regret the decay of a class of men who have been the most hearty upholders of English institutions, principles and prejudices. But, however much we may wish to preserve the race of small landed proprietors, there are now laws of political economy in operation, which, subject to one qualification, are making their gradual extinction inevitable. The price of land increases every year. It returns the lowest percentage. The local charges of rates and tithe-rents are burdensome. The consequence is, that a poor and small landed proprietor

cannot afford to give up the advantages which a sale of his estates would bring to himself and his family. I think I may say that every landowner in this room, who is not a farmer of all the land that he owns, holds his land at an annual loss to himself. If he brought his land into the market, he would obtain such a sum of money for it, that would with perfectly sound investments return him a much larger income than that which he now gets from his tenants, and that would give him a surplus over, far more than sufficient to compensate him for the yearly increase in the value of his estate. Rich men cannot afford to make this sacrifice for position, for sentiments, love of home and old traditions; but the poor man must submit in the long run, and must endeavour to get the most he can for his money. I refer now to those who hold land as an investment, and not to those who buy land for the purpose of farming it and improving it themselves. I hold the freeholding farmer still to be in a hopeful position. If he farms well, he may yet hold his own against the encroachments of our large landed monopolists, and preserve to this country the traditions and character of a class of brave and useful men. The legal changes proposed in the tenure and transfer of land are well worthy of consideration. We have a relic of the law of primogeniture in the rule that when a person dies intestate, his eldest son succeeds to the whole of his real estate, to the exclusion of all other claims, however near and dear. The feudal notion of giving all the land to the eldest son has firmly rooted itself in the Welsh national mind. It is acted upon by the squires as well as by the small landed proprietors. The rule may be defended upon some grounds of public policy, but upon no principle of social justice and right. I trust in time—although the day now appears to be far off—that the conscience of the nation will be educated out of this feudal wrong and that all traces of its influence will disappear from our wills and deeds. In the meantime, the law ought to set a good example and to provide that the landed estate of anyone who dies intestate shall, like personal property, go according to the statutes of distribution among the next of kin. If the law and custom of primogeniture were to cease in this country, many of the difficulties now involved in the land question would cease also. We should then not have as much reason to complain of large landed monopolies. The land market would offer more frequent and better opportunities for advantageous investment than it does now. As things are, the land is so tied up that it is frequently in possession of persons who have only a shadowy interest in it. Improvements consequently are not made, leases are not granted, and the land is left comparatively unproductive. The expensive mode of transferring land which now prevails, is also made a subject of complaint. But as long as property in land may be subject to its present qualifications, as long as it is possible to create tenancies for life, in tail, in fee simple, and for terms of years almost at discretion, the title to landed estate must require the skill of learned men whose services must be adequately remunerated. The way to simplify our real property law and to make dealing with land cheap and expeditious is to do away with varied limitations. I do not think that an owner in fee should be allowed to create tenancies in tail. I fear we cannot go farther than this at present. But even if nothing more were done than the abolition of estates tail, the law of landed property would be somewhat simplified. Until limitations are fixed to the power of settlement, it is positive nonsense to talk of selling land like a piece of ribbon. On account of the cumbrous and expensive system of registration of title adopted under Lord Westbury's Act there was considerable doubt with regard to making registration compulsory throughout the kingdom. The present Land Registry Office in Lincoln's-inn-fields has not been a success. It is a difficult and expensive matter to satisfy all the requirements of the officials with regard to title and boundary. If such a registration of conveyances and mortgage were made compulsory, the small freeholder would suffer great hardship. He would have then to pay a bill not only to his own solicitor as he does now, but also another bill to a town agent, and yet another to the officials of the Registry Office in the way of fees or otherwise. If, however, a cheaper and better mode of registration were devised, the desirability of making it compulsory throughout the kingdom may well be considered. I think I may ask you to infer from what I have already said, that I hold none of the extreme views which are now propounded with regard to property in land. But still landowners must not forget that in a far wider sense than that given to the term in our law books,

they are the trustees of the nation. Private property in any thing, and still more private property in land, is subject to the general interest of the public. *Salus populi suprema lex.* If landowners exercise any of the powers now vested in them by law, to the detriment of the general good, the State will, as it is its duty, interfere, and will protect the public even at the sacrifice of private right. This general principle underlies all law and all government. It is a part of the compact of society and no class of men can with safety close their eyes to it. The Irish Land Act was passed, although it undoubtedly cut down private rights, because its provisions were necessary for the well-being of the people. It is right, therefore, that we in Wales should see if our own house is in order. It is useless to shelter ourselves behind vague verbiage and old prejudices. The eye of an enlightened public is upon us; and the severe scrutiny of that eye and the consequences of such scrutiny we cannot escape. In our history there never was a time in which it was more incumbent upon landed proprietors to do their duty than this. If they do their position is secure. But if, on the other hand, they are neglectful of the interests of the people—if they are unjust and arbitrary to those who occupy positions under them, with the certainty of fate they will have to account for such conduct before the bar of national justice. I think the miserable cottages in which we crowd our labourers one of the worst features of the Welsh country. Many farm-houses, too, are but little better, and are scarcely constructed with a proper regard to cleanliness, decency, and comfort. We erect school-houses to educate and elevate children whom we send back to homes which are often calculated to injure and degrade. Now the evil is patent. How is it to be remedied? I know well that it will take time to set this matter right. Many landowners are not rich enough to adopt at once a course of which their consciences approve. In the first place, the rich proprietors ought to set their poorer neighbours a good example, and erect convenient and healthy cottages and farm-houses upon their estates. In the next, labourers and artisans ought to be encouraged and permitted to build houses for themselves; and in order that they may do this, the landlords may help them by granting them long leases and by giving their support and superintendence to sound local building societies. A good land and building society, guaranteed by the names of the best men in the neighbourhood, ought to be established in every county in Wales. But while I urge the landlords to provide good houses for their tenants, the tenants must not forget that they have corresponding duties upon this subject. The cottagers in Wales fairly do their duty, but the farmers of the really Welsh districts are greatly to blame for their negligence in looking after their landlord's property. A landlord spends money upon a farm-house; he makes the rooms airy, comfortable, and neat. He boards and papers them, and puts in them good grates ready for cheerful fires. He returns a year afterwards. He finds the paper hanging from the walls, a grate eaten up with rust, and a pool of water and a heap of potatoes in his best room. This is intolerable. With the progress of education, the Welsh farmer must arise to something beyond the kitchen fire. I cannot upon an occasion like the present pass over the evils that result to the landlord, the tenant, the agricultural labourer, and to society at large, from the farmer's insecurity of tenure. All difficulties on this subject arise from the idea that there are, or ought to be, even in these days, feudal relations between landlord and tenant, and that their contracts ought not to be subject to the rules and considerations of ordinary commercial transactions. But views like these cannot obtain much longer. A tenant cultivates his farm not for the sake of improving it for his landlord's benefit, but in order that he may by his skill, labour, and the judicious use of his capital, do the best during his life for himself and his children. Such being the case, it is not to be expected that he is to invest his money upon the property of another, unless he has the safe opportunity of getting it back again. The proper cultivation of land requires the foresight of years, and the timely expenditure of money. A farmer must have years upon which he may base his agricultural plans and operations. If he has not, he must keep on drawing from the land every year. He must leave it in a state in which it produces about one-half or less of what it is capable of producing—the state of a great portion of the land in South Wales. A yearly tenant has in truth no chance of doing what is right with his

land. Indeed, he would be criminally neglectful of the interests of his family if he did. Then we hear that foolish suggestion of servile flattery on the one hand, and of pompous conceit on the other, of trusting to the honour of the landlord. For myself I would trust much to the honour of the landed gentlemen of Wales. But when we talk of business, we must have business relations made safe in a proper manner. When landlords lend money to each other, they require, I suppose, proper legal securities. And if a farmer invests the money of his children in a farm, he ought for their sake to have legal security for it. Landlord and tenant may differ about various matters—life is uncertain—trustees may come in during minorities—the heirs may not adopt the views and feelings of their ancestors. Against these and many other contingencies the tenant who probably invests his all in the land ought to be protected. I know that an occasional Welsh tenant sometimes says that he prefers relying upon the honour of his landlord to getting a lease. There is a little bit of servile cunning about this. What he really intends is that he prefers a yearly tenancy with the landlord's honour at the back of it, to a short lease of seven years, which simply means that his rent is to be raised at the end of it. The system of letting that appears to me to be best is that which places a good tenant upon a farm, and which enables him by honestly paying his rent and farming well to remain there for the rest of his life. I think a system of life leases the best both for landlord and tenant, with the arrangement when proper that the rent should be gradually raised on a scale proportionate to the increase in value of the farm. If the landlord grants a life lease he has the best guarantee from the tenant against the drawing away of the resources of the land, which, I regret to say, too often attends the termination of short leases, because the holder of a life lease knows not how long it may last. Before granting the lease the landlord should secure a good man in whom he may repose confidence. The tenant ought to be bound to farm well, according to the rules of good husbandry; but his free action ought not to be hampered by minute and vexatious covenants. Good farming depends upon accident of soil, season, and various other events, which cannot be determined in a solicitor's office. I object to all vexatious covenants with regard to rotation of crops, consumption of straw, and manuring. Confidence ought to be reposed in the tenant to farm well, and if he does not farm well the landlord can resort to his remedies at law or in equity. In every farming lease the tenant ought to have full power to destroy hares and rabbits. With the present game laws it is in the power of the landlord by an over preservation of game to ruin any tenant upon his estate. A good landlord will not of course do anything of the kind; but as there are bad landlords as well as good ones the tenant farmer has just cause of complaint that such a power should by the law be vested in their hands. It appears to me that the law ought now to step in to protect the tenant from the ravages of ground game. The over preserving of game tells, too, unfairly with respect to local taxation. The owner of one estate may over stock it with game and rabbits so as to reduce the yearly value to one-half. The consequence is that it is assessed to that amount only. It follows, therefore, that half of its proper burden of the rates is thrown upon their property. Game, as we know, is not rated at all. It seems very unfair that land over-stocked with game should be relieved from local rates at the expense of other lands, the landlords of which do justice to their tenants and to society by keeping the game down within the limits of legitimate sport. I think that in all leases the tenant should be protected against the destruction brought to the results of his industry by hares and rabbits. I trust that in addition to this the law will step in and protect him when such protection is refused by the landlord. I am not against sport; I believe its disappearance from the country would be a great loss, but I still think sport to be consistent with doing full justice to the farmer, and with the proper development of the resources of the land. The country requires that the land should be made as productive as possible. London and Manchester, Birmingham and Liverpool, and all the great towns and cities of this kingdom, require the landowners to permit their tenants to make the most of their land. As I have already said, for this purpose they are the trustees of the nation. It will not do for them to fall back upon old feudal notions which will not bear the light of this day. They must give over ideas of servile obedience in

all things from those who occupy land of them, and must seek only to enter with their tenants, as independent men like themselves, into such relations as are calculated to get the most out of the land for themselves and for the country. Their chief duty is to make as far as in them lies every nook of this country productive. They ought to seek to make the farmers and agricultural labourers prosperous. These are the landowners' duties. The country imposes on them these sacred trusts; will they discharge them faithfully? The country is standing aside, is waiting, is giving them a chance. Nay, it has done a great deal more, it has given them a positive warning in the Irish Tenant Right Act. If long and liberal leases are not granted, such as are required fairly to develop the resources of the land, you may rest assured a Tenant Right Act will be passed for Wales in the course of a few years. I do not think the typical Welsh landlord will read the signs of the times. I dare say he will smile complacently at what is now said. He will stick to his yearly lettings, his game preserves, his feudal authority over his tenants; he will, like Mrs. Partington, seek to do battle with the Atlantic ocean, which, with the certainty of fate, is coming on to sweep away his insane prejudices and the monuments of his injustice. A Tenant Right Act is soon to settle these questions, if he will not. I wish to speak in no unfriendly way of Welsh landlords. The system, the prejudices, the faults, of which I complain, they have not created, but have inherited with their estates. As far as I have any personal interest in this question, that interest is on their side. But it would be blind folly for us to close our ears against the demands of the time upon us, to refuse to listen to the thundering that is already at our gates, to cry out peace when there is no peace. In ways that I entirely condemn the land question is now being universally discussed. Theories wild and dangerous are propounded with regard to it; the grievances which exist are unfairly magnified, and by certain classes in this country every effort is made to cast blame upon the landed proprietors. All I wish is that the landed proprietors should not deserve it, but that by freely developing the resources of their land, by doing right to their tenants and agricultural labourers, they may be ably boldly to court inquiry into their conduct and position, and appeal with confidence to the justice of the British people!

Mr. PHILLIPS (Bolshau) said I think that the feeling existing between landlord and tenant, where the tenant holds from year to year, is much better than Mr. Williams represents; and that if he goes to London and listens to those gentlemen talking there of the feeling that exists between landlord and tenant in Wales, he goes to the wrong place. Now that he has come to Carmarthen, if we could bring a lot of landlords and tenants together and have the question actually discussed amongst them, he would find there is a great deal better feeling amongst them than he represents. I think that is the only point on which I object strongly to what Mr. Williams has said. With regard to leases, I can tell you that there are many tenants in this county and elsewhere in Wales who infinitely prefer holding their land from year to year to having a lease, because there are a great many objections to a lease. In the case of a lease for seven years Mr. Williams says at the end of seven years the landlord looks forward to an increase of the rent. But perhaps if the landlord gave a lease for 14 or 21 years the circumstances would be such that there would be an increase of the rent. There are times when land rises and falls in value, and I think it is but right that the landlord should have the benefit of the times as well as the tenant. But if you enter into the question thoroughly you will find that the tenants have no more reason to complain of the landlords than landlords have of tenants in the matters of a lease. If a landlord give a tenant a lease he is a great deal more in the power of the tenant than the tenant would be in the power of the landlord. You say the tenant invests his cash, his all on the land. I say he does not. And I say that the tenant can go on from year to year trusting to the times and the good faith of the landlord, and remunerate himself so as not to be a positive loser in the case of an emergency. I will not say he would benefit by giving up his tenancy, but I mean to say he can so cultivate his land for a few years that he can leave his farm with a positive benefit to himself. I am not going to occupy the time of this meeting by discussing the whole question, but I think I ought to say these few words in the interest of the landlords as well as the tenants. I consider

myself a landlord as well as a tenant; my interest goes with the tenant as much as the landlord. If my tenant fails so do I; if my tenant improves himself I consider I am sailing in the same boat.

The Rev. LATIMER M. JONES said I agree with Mr. Phillips that there are many tenants in this country who do not desire a lease of their farms, who would rather have a yearly tenure than a lease. They want to enjoy freedom, and if they had a lease for 14 or 21 years they would feel themselves bound for 14 or 21 years. They feel that if they are only tenants from year to year they are at liberty almost at any time to take their stock and crop to another farm. I have the control of a great many farms, very small ones I am sorry to say, but I tell this meeting that there is not a lease on one of them. Nor have I ever been asked for a lease; nor do I know of a single tenant on the estate who wants to have a lease. Yes, there is one exception; and in that instance it is the proprietors of a Dissenting chapel who are very anxious to get a lease. That I can understand; and I tell you they shall get it too. We have heard a great deal of rhapsodical nonsense about evictions in Wales, and it has been attempted to show that landlords here in Wales are a great deal worse than landlords in England. Now I think this meeting is pretty generally agreed that landlords in Wales are as good as the great body of landlords in England; so that the land question in Wales if it comes into prominence at all will be connected with the land question in England.

Dr. NORTON said: The entailing of land, he held, prevented a large number of people who would otherwise buy land, from doing so, because of the great expense attending the disentailing of it. There were many people in this country, he believed, who owned land who would be only too glad to disentail it; and there was an immense number of people who were desirous to invest their savings in land who were hindered from so doing by the expenses apart from the conveyance. An ordinary conveyance in this country was exceedingly expensive, but what was the expense when connected with entail? That meeting was not the place for a man to mention his own private affairs, but he might say that some time ago he was himself unfortunate enough to buy a little bit of land that was entailed. It was a portion of an old estate, and the person who sold it was descended from an old Welsh family. Well he bought this land and without going into the minutiae of the matter, suffice it to say, that there was enormous difficulty experienced in the disentailing of it. When he went to the lawyer's office after receiving the bill of charges the difficulties connected with it were pointed out to him, although the purchase money was only a few hundreds of pounds. Now it was wrong that such a state of things should continue to exist in a country so highly civilised as ours; it placed barriers in the way of the sale and purchase of land in all parts of the country, for the possession of land even in small farms elevated the status of the men who obtained them. And he maintained that they could not do better than sub-divide the land into small farms. Although he remembered reading in a great number of instances that the learned men of this country have said that the division of land is a bad thing, yet he would say that by putting a man in possession of a small plot of land you give him a stake in the country, and it could have no other effect than that of making a better citizen, a man that would stand against revolution, a man that would endeavour to make good laws for the community of which he was a member. Therefore he contended that the first thing to be done was to simplify the title to property. He believed with his late father that the system of registration that exists in America—of course they did not like to be Americanised—was very much better than here. There the cost of registering the title would not amount to more than three or four dollars for 100 acres of land. And when a person purchased property in America on those terms, it could be transferred to another in as easy a manner. And he could not see why an easy system could not be devised for the registration of property in this country by the general public, to which the lawyers themselves should be compelled to agree. Because it should be remembered that lawyers like doctors would not willingly do anything against themselves. It was not likely that they would willingly consent to a plan which would relieve them from the trouble of reading through deeds and charging so much for it. Now he did not grumble at them at all on that account. If privileges were conferred on any class, that class would use those

privileges for its personal benefit, and not for the benefit of the general public.

A Voice: Disestablish the lot.

Dr. NORTON said that need not be done. He knew it was said that if cheap litigation, for example, could be had, that it would be the means of causing more litigation than at present. But there would be no room for litigation if matters were carried on fairly.

Mr. BUCKLEY (Penyfa) said it would appear by the title given to the very able essay that had been read, that there was something peculiar in the land question in Wales, something different from the land question in England. Now, he was pretty well acquainted with a good deal of land and farms in England, and had returned only the previous night from Warwickshire where he had a good deal of intercourse with farmers, and had gone over a good deal of land. The peculiarity of the land question in Wales, if it existed, hinged chiefly upon the Welsh farmers not having capital to invest in their land to carry out cultivation as was the case in most parts of England. The question would therefore arise how was capital to be directed into the land in Wales. And there he agreed very largely with the opening address which had been delivered, that there must be security for the investment. The remarks made by Mr. Williams respecting leases should, however, be very much qualified indeed. The man who was going to take a farm in a very dilapidated state, who intends to drain excessively, and was going to build, and almost to treat the farm as if it were his own, such a man would lay out 20 or 30 per cent. of the fee simple in the land, and he ought to have a long lease. But such instances were very rare exceptions to the general taking of land. Now he would mention the instance of a letting that he was familiar with, which took place last Michaelmas. It was not the case of a small farm, for the rental was nearly £100 per annum. The person who took it wanted a security for his outlay, and he took it for his son; being a wealthy man, he gave his son down at once £2,000 to go into the farm with. His son would have a good deal more if it was required. His wish was that the capital invested in the land should be productive, so that he did not want a lease so much as security. Now there he came to the point. He believed, as had been stated, that a large proportion of the Welsh farmers did not want leases, but they required such an agreement as would give them security. Now, what security did this man to whom he had been referring ask for and what security did he get? because he himself happened to be familiar with the provisions of the agreement that was made. Well, if he drained on a certain principle, and his landlord gave him notice, he would be paid in full for his drainage. In liming the land he would be paid for all the lime put in during the last year, for one half of the lime put in the year before, and one quarter of the lime for the year before that. Then as to manure; he would be paid for one half of the artificial manure, and one half the value of the farm-yard manure that went into the land the year before, on his showing the bills. Then as to the in-coming tenant taking to the crop on the land, he knew that the landlord and tenant walked all through the fields just before harvest, and both being admirable judges, they easily put an estimate on the value per acre of the wheat, barley, and oats, and soon came to an agreement as regards that. And the same thing it was agreed should take place at the end of the tenancy on the landlord giving notice. But if the tenant gave notice, there would be a qualification to some degree. But there were no restrictions as to cultivation further than that none of the meadows or pastures or anything of the kind were to be ploughed up. With such provisions as those that had been mentioned no tenant would hesitate to lay out his money. He ought to have mentioned something about going through the roots, because on that farm there were something like 30 acres of roots, or even more than that. They were very heavy crops, and the valuation came to a large sum; so that if a man cultivated in that kind of way he would have a large sum whenever he went out of his farm. And he could cultivate in that way with perfect security, yet without a lease, having only a good agreement. And he believed that to either Welsh or English farmers having capital an agreement of that kind would be more preferable to them than a lease by which they would be bound up for a length of time. He ought also to mention something about arbitration in the case to which he had referred. In the agreement there was a

provision for arbitration should not the landlord and tenant be able to come to terms. In that instance they did come to terms, because they were both good judges. It was a large farm. The farm was let on liberal terms by the landlord, and he had no doubt that the tenant would do well, and he had no doubt that the tenant would not feel greater hesitation under his agreement than under a lease in doing everything for the land that would promote production and improvement.

The Rev. Mr. CAUTLEY said there had been a comparison drawn between England and Wales with regard to agriculture; but it had not been fairly drawn. There were great difficulties experienced by agriculturists in Wales which were not encountered in England. One of the difficulties was produced by the humid climate, and the wetness of the land necessitated a great deal of drainage. Again, there was an enormous quantity of boundary fences to the land, which required a great deal of expense to keep them in repair. As an illustration he would mention that on his little property of about 700 acres there were no less than thirteen miles of boundary fences. That seemed to be a most exorbitant quantity, but it was a literal fact. Therefore he felt a deep sympathy with the landlords and an equally deep sympathy with the tenants, who often found their land overrun by the cattle of their neighbours; in fact, his own shepherd was often employed in hunting up his own stock and driving the cattle of others off the land. Such were some of the difficulties that had to be contended with in Wales, and the consequence was that the conditions which landlords here had to make with their tenants differed in a very great degree from those made in England. Now in the first place it would be most unreasonable, particularly when the tenants as a class were notoriously poor, to require them to meet those difficulties single handed. He felt that the tenants in Wales required very great assistance from their landlords; and that without such assistance the improvement that was so much desired by Welsh agriculturists must be exceedingly slow, until the two—both landlord and tenant—put their shoulders to the wheel and worked together in an united and liberal spirit for the promotion of the one general good. To do that what each party required was security. The landlords as far as he could see would easily be got to give their tenants security if the latter had much money that they were willing to lay out. But he perceived that the farms throughout the district were to a considerable extent occupied by tenants exceedingly poor, who never cared to keep up their fences, who had no chance from want of means of dealing liberally with the land, who would rather send their cow to a poor narrow black bull that fed on the mountain, the use of which might be obtained for nothing, than to a well-fed bull for which they might have to pay ten shillings. What under such circumstances was a landlord to do? He was bound to bring his own will to bear on the tenant, and reduce the evil as much as he can. Now all that kind of thing arises in a large measure from the smallness of the holdings in Wales. He dare say there were gentlemen in the room who sympathised with small holdings. Now he lived in a parish of 18,000 acres of land, and the land was divided among 80 tenants, every one of which had an excellent farm. But if the holdings had been small there would not be half the quantity of corn or half the quantity of meat which was now produced there, simply because the farmers would not have the money wherewith to do it. Now in Wales oil-cake and artificial manures were very little used, and that was because the tenants had small holdings and also because they stood in fear in case they expended money on their farms. He must be permitted to say that his conviction was, from conversation with the people with whom he mingled, that in Wales there was a very strong fear in the mind of every farmer of having his rent increased should he in any measure improve the cultivation of the soil. They might meet the question as they please, but he would tell them plainly that was the fact as far as his experience went, and he had inquired a great deal on that point. And he knew not only that the fear existed but that there was even ground for it. He knew that the rent had been increased in instances where the farmer cultivated more liberally and produced a little more corn in his stack-yard. Surely such a thing as more corn, &c., in a tenant's stack-yard was just what a landlord ought to desire to see. A landlord ought to desire to see his tenant's stack-yard containing plenty of stacks, an abundance of roots, and as big roots as he could grow. But for a tenant to do that he must have security as

had been said. He was able to speak very clearly on that point. He knew the circumstances connected with one of the best farming districts in England, viz., Lincolnshire. He did not suppose there was any part of England where farming was better than there. And he learned from a great friend of his who lived in that county, an agent who had the management of many large and valuable estates, that he gave infinite preference to a yearly occupancy with perfect security to the tenant. Now again, he had with him from another friend of his, who was well known to all present at the meeting—it would not be right to mention his name—a copy of a lease which that friend intended to give to his tenants, and which, unless they accepted, they would have to go out of their farms. They had discussed together the provisions of that lease over an excellent glass of port wine, and in that way things could be discussed pleasantly, in fact he found there was no place where a thing could be discussed more pleasantly than at a dinner table. Now, he would just give the meeting an idea of the nature of that lease by reading one of its requirements—"A certain quantity of poultry, turkeys, eggs, and skiffs of coal are to be brought at a certain time at the squire's house." Surely the tenants would not accept that. As he said to his friend that was only imposing on them an additional rent. And why, therefore, could it not be put into the lease in its right form at once? Then, again, there were other conditions requiring the tenants to keep up the river bank, to keep up the fences of the plantations, in fact to keep everything in order. In that lease there were about thirty covenants; and he would defy his friend to get his tenantry to carry out these covenants. And if the tenantry could not carry them out what was the use of the pretended attempt to make them: what was the use of tying up the tenantry to a lot of covenants which were not intended to be carried out. Why could there not be a more distinct understanding between the tenant and his landlord, the landlord saying to the tenant, "You trust me in some things, and I will trust you, and will not interfere with your farm." The landlord might ride his horse on the snaffle, yet still have the curb ready in case it were wanted. He would just refer them to what that eminent author Arthur Young had said about the state of Scotland when he paid it a visit. At that time the state of Scotland was infinitely worse than anything now existing in Wales. Arthur Young said that nothing could be worse than the state of farming in Scotland at that time in the Lowlands; and it was produced and maintained by the landlords giving their tenants leases, binding them down for twenty-five years with stringent covenants. The fact was the Scotch tenantry at that time were like children, and did not know how to farm. This system of long leases was altered there; and as soon as the farmers saw it was to their interest to farm well they quickly began to improve; still it was necessary that covenants should be imposed suitable to circumstances, otherwise tenants might take undue liberty with the land they occupied. He knew an instance of a farmer who used some 400 pounds of cake every year in the feeding of his cattle; but he had a neighbour who did not use anything of the kind. Did anyone suppose that one of these farms would produce as much as the other? No. Well, then, the two tenants required to be differently treated. Now, protection for both landlord and tenant must be obtained by one of two things, either by leases or annual agreements. There were great objections to leases, although he did not wish to dwell on the subject. It was said that in a twenty-one years' lease there would be seven years of getting a farm into good condition—a succession of seven years of good farming; but, then, there would be seven years of drawing out of the land as much as possible. That would be the effect unless the tenant was stringently tied up during the last seven years. It would be according to human nature, that a man after putting something into the land should try to take it out again. In nine cases out of ten tenant-formers did it. Now, he did not think if he were a large landlord he would give a lease on a single farm unless the covenants were very strict. He would say, "Now, Thomas, here is a lease for you, if you like. If you do not like the covenants, there is an annual agreement, take which you please." Now, in looking at the covenants in the copy of an annual agreement which he had received from Lincolnshire, he was struck with the hard way in which they pressed on the incoming tenant. The incoming tenant was to pay for a large quantity of oilcake, of bones, and a quantity of other things which were called

permanent improvements, and it would bear very hard on a young man who went into a farm, perhaps with no more capital than was necessary for him to stock his farm with, and yet was required to pay down £1,000. That would cripple him. What would be the consequence? He would go to the bank. Now, they had heard something about the lawyers' consciences, but bankers had consciences too. They were very accommodating, no doubt, but when they got people into their hands they generally pinched them very tight. His object in referring to that was to show that the landlord should stand in the stead of the incoming tenant and arrange with the outgoing tenant what was to pay. Generally speaking, there was some difficulty about an arbitrator between the outgoing and incoming tenant, and why should not the method be adopted which he had suggested? He would prevent those two men, the outgoing and incoming tenants, from coming together by letting the landlord himself make whatever arrangement was necessary with the outgoing tenant. He recommended to the meeting a book containing papers read on the tenure of land by Mr. Masfen, at a meeting held at Birmingham on the subject, when the leases of Lord Lichfield were discussed. Personally, he was of opinion that the question of leases and the question of covenants should be separately discussed, for the whole subject was one of great importance, and not easy to solve. With regard to the land question in Wales, he had heard two or three strictures made on points to which he had intended to refer. There could be no doubt that the land in Wales was capable of very great improvement, although he was not going to discuss the improvement of land; but still he would say that it was capable of being much improved by an improving class of tenants. Owing to the number of small farmers in Wales, the land did not produce as much as it was capable of producing. He did not wish to see small holdings extinguished, but they should be reserved on estates as a sort of beginning to young farmers, who might be advanced to a higher position as they deserved it. Again he would say that small farms for that reason ought to exist, and he hoped they would continue to exist. Still, if a landlord wished to have a tenant of whom he might be justly proud, he must get a man of capital, a man of enterprise—a man who with capital and enterprise would cultivate his land on the most improved modern system, one who would not hang back, but keep up to the advanced state in which we were now living. Now, he had brought implements into Wales, and the labourers have not known how to use them; they have no understanding of them. Reference had been made to the question of cottages, and so he was brought to that subject also. And he would say that until a set of good labourers could be found in Wales, there would not be a set of enterprising farmers. A farmer could not farm without the labourer. The system of cottages in Wales was excessively bad, and it was a matter to which landlords, he felt sure, must pay attention. For what was the consequence of the present system of cottages? The result of it is that the labourers have no care for their homes; they go into Glamorganshire, or into England, or emigrate to one of the colonies, because they have nothing to attract them to the home in which they have been born. Labourers might spend a whole winter in this part of the country, and get only a day's work now and again. He could say more on that subject; but would only remark that it was everything in considering the land question in Wales to see how a good class of agricultural labourers could be got. He would rather have three men at 15s. a week than four men at 11s. per week, who were neither able nor willing nor careful to do their duty. Now, he said, that, after having some experience in the employment of agricultural labour in Wales—for at the present time he was paying about £20 per week for labour in the Principality—the labourers of Wales were quite capable of being trained; but the truth was they had no thought, and the whole system of labourers was but a makeshift system. The labourers left this thing here and that thing there, and they acted in such a way as would half ruin a landowner in time unless he could take care of himself. A few words in conclusion. There was a most happy country. He himself lived in Cambridgeshire, yet nothing did him so much good as to come down into Wales, and breathe the fresh air for a few weeks every year. If he carried a gun in his hand he need not go far from home, and he should like to go some time for a few cock pheasants

over the land of his friend the Rev. Latimer Jones, and it was his delight to go over their arable lands. Indeed, he might say that he would rather make two per cent. in Wales than five per cent. in Cambridgeshire. And not only so, but he had met in Wales with great kindness and hospitality. His duties in his Cambridgeshire parish were large. He kept two curates; but now they insisted upon his return home, flattering him by the compliment that they could not do without him. For that reason he feared he should be reluctantly compelled to return in a short time. One word more with regard to the capabilities of the land in Wales. He feared its capabilities were undervalued. The land in Wales only wanted energy and drainage and deep cultivation and well manuring with the growth of as little corn as possible to make it yield well. He had been just selling three and a-half acres of turnips on land which two years ago was comparatively exhausted. He could have hunted a mouse all over the corn crop on it, and never lost sight of it. Now, he had obtained £21 7s. per acre for those turnips, and the land was capable of producing a great deal more.

Mr. LEWIS BRISNOB would say the same as Mr. Buckley and other speakers that leases were not required in this country, and that leases would have the effect of encroaching on the rights of property, and for the reason that they were dangerous in that respect he objected to them. And therefore tenant farmers ought to accept agreements. Besides there was the danger of tenants not being able to carry out the leases which they had obtained. A tenant might also get a bad lease, say twenty-one years, and after expending the whole of his money in connection with it he might be obliged to fulfil its conditions at a loss. But on the other hand, if a man had a yearly agreement he might back out of it at any time, and instead of being obliged to spend a large sum of money in connection with it, might put that money by, for those who came after him. That was one reason why a lease should not be forced upon a tenant. A yearly agreement was far better for a tenant farmer; and this would be better for the landlord also, because if he had a bad tenant he would then quickly get a better one in his place. Now, he did not go so far as the rev. gentleman who had just sat down in respect of arbitration. In such a case as he had suggested the landlord could not help favouring the incoming tenant. He would be tempted to discard the interest of the one who was about to leave him. For every lease in this country twenty agreements would be found, and he looked upon that as something like a testimony that agreements were found to be better and more advantageous. Another question mentioned by Mr. Williams was that of entail. Now what he understood to have fallen from Mr. Williams on that point he also considered to be dangerous. Moreover, he thought on that subject Mr. Williams somewhat contradicted himself. He asked for fixity of tenure for the tenant, and yet he objected to entail which gave fixity of tenure to the landlord. He himself held that entails in the abstract were good. Everyone knew that there were persons who were disposed to squander their property, leaving their children after them penniless. For that reason he contended that the entail of estates ought to be upheld. And now as to the expense of conveying estates that were entailed, to which Dr. Norton had referred. It was his opinion that the expenses incurred in the case Dr. Norton had cited, must have resulted from the investigation of a long title, a totally distinct matter. His own experience was this, that the cost of barring entail was only some £3 or £4, anyhow it was not many pounds. With regard to the game question mentioned by the Rev. Latimer Jones, he was in favour of some law by which it should be embodied in an agreement between the landlord and tenant that the landlord is to permit the tenant to destroy the rabbits, the tenant giving the landlord two or three days' notice of his intention to do so.

Mr. BUCKLEY explained that he was in favour of the landlord and tenant making every arrangement they could, and that an arbitrator should be called in should such an attempt fail.

Dr. NORTON also said that he spoke of the expense and difficulty of barring entail being an obstruction to speculation in land.

Mr. BRODIE (Tyrdail) considered it was bad to agitate what he called the first part of the land question, touching the rights of property. At the same time he could not understand the objection against leases. Those who objected to leases were labouring under a mistake. He himself came from a country where leases were universal, and it was hardly possible to cal-

culate the improvement that had been effected in Scotland under them. It might easily be believed that a tenant farmer was as proud of his profession as a clergyman or a doctor was of his, and he contended that the way to make a tenant farmer thrive was to give him security under a lease. It was a matter of pride to a tenant to walk over his land after he had drained it. But he contended that if a tenant farmer was continually liable to six months' notice he would never care to effect improvement. Disguise it as they might, leases were the only and the great security for improvement. Something had been said about entail and large properties. Now, he could tell them as a fact that tenants preferred to be on large properties. And this point had struck him that it was generally the large landed proprietors who were the foremost in effecting improvements. What did they find in the county of Carmarthen? They found Earl Cawdor draining and improving in every possible way. They found Lord Dynevor also draining in full force. In his own neighbourhood the same thing had been begun. Now those whom he had just named were some of the great titled gentlemen of the county, and what were they but descendants of Welsh princes and Scottish chieftains? On the other hand, there were many of the smaller landowners who suffered their property to remain in the same state as Julius Cæsar left it. There could be no doubt about it. There was another fact, whether it would please Mr. Bishop or not, that land let on lease would fetch a higher rent. That had been found out. And it was a foolish idea that a tenant if he had a lease for 14 or 21 years was altogether at the close of it at the mercy of the landlord. There was no such feeling. A tenant, if he was a good tenant, had nothing more to do, on the approaching expiration of his lease, than to apply to his landlord two or three years before its termination, and ask that it might be renewed. And generally speaking it would be renewed. In his own case, when he left Scotland, he asked the agent not to let the farm for a short time, and he did not let it for more than twelve months. As for tenants not wishing for a lease, that was a pity; in that case they should trouble themselves with some other profession.

Mr. LEWIS (late of Llwynfedwen) also spoke in favour of leases.

The CHAIRMAN: I said it appears to me we have been wandering away a good deal from the subject this evening. The question as I understand it to be, was not the interest of the landlord or tenant, but the land question in Wales, and what is the best way of making the land most productive. Now, gentlemen, the tenant's interest has been most ably advocated that he should have fixity of tenure. I believe that the landlords in Wales are honest men, and that they wish to do no injustice to their tenants; I believe they would be most anxious that their tenants should have every security that the money invested in the land should be returned to them. But I think this also, that the landlord should have security that the tenant should not rob his land. We know very well, gentlemen, that a tenant may go into farm while it is in good condition, and that he may wrong that farm, and leave it to his landlord at half its value. Now the landlord should have some security to prevent the tenant doing that. Now the point to which I have the pleasure of directing your attention is that of

justice to both landlord and tenant. I think before we tie up land a commission should be appointed to take into consideration the value of the land at the present moment. We should have a kind of machinery, something similar to that under which surveyors are appointed under the Dilapidations Act for the clergy. Landlords should have the power of calling in a surveyor, and ascertaining whether the land is cultivated according to the terms upon which it is let. And the tenant should also have the power of calling in the surveyor to say whether the landlord was coming down upon him, and requiring him to do more than the covenants of his agreement compelled him to do. I think if you interfere with free trade in land, and you do not allow it to be a mere agreement between the landlord and tenant, you must have some machinery of this kind. I am only suggesting this in case you are going to carry out Mr. John Stuart Mill's theory that there is to be 'fixity' of tenure, and the landlord is to have no control over his land. I think, however, that it will be much better that the whole matter should be left as it has been left, a matter of arrangement between tenant and landlord. I must confess I agree with Mr. Brodie in saying that there is nothing like a lease, provided you have something of the kind of machinery I have suggested, whereby a surveyor should be called in to see that the lease is carried out. There should be an impartial person whom either the landlord or tenant should be able to call in. And I would not have the choice of the arbitrator left to the two persons; I would have a public arbitrator. The Rev. Latimer Jones has said you must have good tenants. It is all very well to say that, but the landlord may get a good tenant, and if he has a lease his son who may be called upon to carry it out may be a bad one. Therefore if you have fixity of tenure you must have some power to compel the person who takes the land to fulfil the covenants of his agreement. I have thrown out this suggestion because I think it is of the utmost importance that the question of the holding of land should be thoroughly discussed. There can be no doubt that it is one of the most important questions. Nobody can go through this country without seeing that there is a great deal of land lying idle that is capable of a great deal of improvement. If we are to have the question left to vexatious cogitation it will paralyse the action of both landlord and tenant, so that the sooner it is settled the better. For I am sure there are many landlords at present who have stopped improving because they do not know whether they will ever recover the money they have laid out. On the other hand the tenants are afraid. I trust before long that the question will be effectually settled, and that we shall know what our interests are. This is essentially necessary now, when wild suggestions are made as to land, as if it was not similar to any other kind of property. There are people who look at the matter as though persons who have been receiving 1 or 2 per cent for their land are to be deprived of it and not receive the value of it. I am delighted that my friend Mr. Williams, who I thought would have introduced this question in some extreme manner, has not done so.

Mr. WILLIAMS replied, and a vote of thanks was passed to him amid much applause.

THE FOOT-AND-MOUTH DISEASE.

LOCAL RESTRICTIONS.

At a meeting of the local authority for the county at Elgin, Mr. McLean of Westfield presiding,

Mr. MACKESSACK (Ardgye), in terms of previous notice, moved, "That all regulations made by the local authority with the view of preventing the spread of foot-and-mouth disease be recalled on and after 1st December, 1871." He had not made this proposal without having consulted other farmers. He had spoken on the subject to twenty or thirty gentlemen, and they were all agreed on the point that something should be done in the way of changing the regulations and restrictions of the local authority. It was well known that foot-and-mouth disease had existed in this county for a very long time. On

some farms it existed so long back as twenty-eight years ago; and it existed on his own farm eighteen years ago, though he (Mr. Mackessack) did not know of it at the time. About eight or ten years ago, a great many of the farms in the county were infected; indeed, it went from one end of the county to the other. Well, what did the farmers do at that time? There was no word about cleansing the byres or putting out the dung as they did now when the place was declared free; and the result was that there was not one case for ten now. He remembered perfectly well that at that time the disease existed on his farm at this period of the year. Well, he drove out his dung in the spring following on the lea fields, put fresh cattle out,

and there was not one of them infected with the disease. Most of the farmers did the same at that time. Now, however, before a farmer could get his place declared free, he must cart out his dung as soon as the place was declared free of disease, and incur a great many other expenses. There could not be a more effectual way than this of spreading the disease. A farmer told him, the other day, that he had not the disease on his farm, but his neighbour had had it, and as he was carting out the dung in terms of the regulations, it was certain to spread to his farm. Then there was another restriction which he considered very bad, viz., that which prevented the removal of animals from any field or place where they had been discovered to be infected with the disease. At Carsewell, in the end of harvest, fifty cattle grazing in a field were discovered to be labouring under the disease. It was the time of the bad weather; they could not be removed, and he was quite convinced that the owner of the cattle must have lost 50s. per head, which was a very serious matter. Having met the owner one day, he remarked that it was cruelly to animals to keep the cattle outside. He replied, "I am not allowed to move them. The local authority will not allow me to drive them only one or two hundred yards along the turnpike road." He was sure that, had the owner of these cattle been allowed to put them into his steading, he would not have lost 5s. a head, instead of 50s., or about £120. The cattle stood there during a long run of bad weather; and, indeed, it was a wonder that some of them did not die. They were next the public road, and could be seen putting their heads over the dyke, and, consequently, it was almost impossible for any cattle to pass along the road without being infected; whereas, if they had been kept comfortably in the stable, there would have been no chance of infection. It was his opinion that the Privy Council made quite enough of restrictions without the local authority making any at all. By the Orders in Council, they could fine people who were found with diseased beasts, and who had not so reported to the inspector. If the farmers would only try to manage the disease as they did in former years, there would not be one case for every two that there were now. A Ross-shire farmer told him the other day that they were just beginning to see that the local authority act was all nonsense, and did more harm than good. Some counties had given it up altogether; others had never taken it up at all. It was quite competent for them to drop it at any time. He had no objection, if the meeting wished to modify his motion, and make it to the effect that they recall the regulations for three months. The farmers could not surely object to this; and he was pretty certain that if they adopted this course, there would be very few cases of foot-and-mouth disease in the county at the end of that time. He might mention that several parties had told him that they would just as soon buy cattle with the disease as without it, because they would rather have it past than be bothered with it again. However, he did not mean by that that he wished to keep the disease—he would rather see it sent to Jericho, and the local authority powers after it. He concluded by proposing the adoption of his motion.

The CHAIRMAN: Mr. Mackessack has fallen into one mistake with regard to the moving of cattle from one place to another on the same farm. We have no power to dispense with that regulation, because it is enforced by Act of Parliament. Any rule that has been enacted by the Local Authority can be dispensed with, and as far as I am concerned, I am ready to join with you in requiring their suspension; but there are certain matters with which we cannot interfere.

Mr. MACKESSACK: If it had not been for the Local Authority, could not these cattle, to which I have referred, have been removed?

The CHAIRMAN: No. I looked over the various Acts of Parliament, and I find it is illegal to convey infected cattle over any public road, or to expose them in any market or sale-yard, or in any place adjoining a sale-yard, or to carry them by rail, or to keep them in unenclosed ground, or—and this is the most important of all—to fail in reporting to the police the existence of the disease as soon as it is observed. The Act of Parliament also makes it obligatory on us to appoint an Inspector, whose duty it is to report to the Local Authority and the Privy Council the existence of disease.

Mr. YOOL remarked that there was no doubt that if the cattle were labouring under the disease, they could not be removed.

The CHAIRMAN: Mr. Mackessack has only mentioned one item which we have power to dispense with, viz.: The carting out of dung.

The CLERK: (Mr. Cameron) said that the regulations as regards the carting out of dung were made by the Local Authority, in terms of the powers conferred on them. The following was one of the regulations which Mr. Mackessack's motion would strike at: "That all sheds or places used by animals infected with foot-and-mouth disease shall, as soon as the disease has ceased to prevail, be disinfected to the satisfaction of the Inspector appointed by the Local Authority." If Mr. Mackessack's motion was carried in its entirety, the effect of it would be this—that farmers and others who moved beasts would only be prevented from moving affected animals, but would be perfectly free to move other animals that had not taken the disease. It seemed to be pretty generally agreed that the carting out of dung and the whitewashing of the premises could be dispensed with.

Mr. WILLIAMSON thought Mr. Mackessack's motion was a very good one, so far as the driving out of dung was concerned; but when he considered that the effect of the motion would also be that when any cattle were affected, it was in the power of the farmer to remove those which, though not affected, would be in the adjoining byre, he thought it was rather a dangerous step to take; and he for one would decidedly set his face against that part of the motion. They knew that some parties would not take cattle to the market when they had others affected; but they also knew from experience that there were parties who would not scruple to do so. If that were done, they would never be free of foot-and-mouth disease.

Mr. YOOL thought that the cattle in this country were subject to attacks periodically from foot-and-mouth disease; but so long as the importation of foreign, and especially of Irish beasts, was allowed, the country would never be free of it. They seemed to be the means of propagating the disease; and so long as they were allowed to come into the country, it would not be possible for the Local Authority to stop the spread of the disease. In October, 1870, the Privy Council gave power to Local Authorities to make further regulations with the view of stopping the spread of the disease. He saw the other day in the *Mark Lane Express* a statement that not one half of the Local Authorities had taken advantage of these powers, and several that had taken advantage of them had rescinded their resolutions. It appeared to him that the rules made by the Privy Council would be just as effective in checking the disease as these additional rules that had been adopted by the Local Authority, considering that these Irish beasts were continually coming into the country, and that they had no power to exclude them.

Mr. ROSE was quite agreeable to the rescinding of the regulation in regard to the clearing out of dung, but could not approve of cattle being removed from places where the disease existed.

Mr. MACKESSACK: I am quite satisfied that if you adopt the course I have proposed for three months, you will not have many cases to report.

The CHAIRMAN: The general opinion seems to be that these rules with regard to the clearing out of dung might be dispensed with from to-day; but that the control of the Local Authority over the movement of cattle on farms should remain as heretofore. The disease, so far as I can judge, is on the decline now.

Mr. HARRIS: If Mr. Mackessack's motion be carried, how would it affect our control over the markets?

The CLERK: It would not affect it all. It might be advisable to explain to the meeting that the regulation for the carting out of dung on places where the disease had existed was simply an instruction to Mr. Tait from the Local Authority. That could be rescinded immediately, and they could also rescind altogether the regulation as to disinfection, without touching the other rules.

Mr. YOOL remarked that he held the opinion that the inspection of markets was of no value at all; it was simply a waste of public money.

After some further conversation, Mr. Mackessack agreed to modify his motion as follows:

"That regulation fourth of the Order of 25th November, 1870, be recalled, which is to this effect—'That all sheds and places used by animals affected with foot-and-mouth disease shall, as soon as the disease has ceased to prevail, be disinfected

to the satisfaction of the Inspector appointed by the Local Authority."

Mr. WILLIAMSON: I think that will be satisfactory to everybody.

The motion, in its altered form, was then unanimously adopted by the meeting.

A meeting of the members of the Devon and Cornwall Chamber of Agriculture was held on Thursday at the Royal Hotel, Plymouth, to "consider the regulations under which foreign cattle are imported into this country, with a view to checking the foot-and-mouth and other contagious diseases." The chair was taken by the president, Mr. John Trenayne, of Heligan. The attendance was very small.

The CHAIRMAN considered that the subject under consideration affected all classes of society, consumers as well as producers. He had hoped at that particular time, when the fat cattle show had called so many agriculturists into Plymouth, and more especially as Devonshire had suffered exceedingly from the disease, there would have been a large meeting, as it was desirable to follow the practice of other chambers, where large and unanimous meetings had demanded from the Government more stringent measures for repressing disease.

Mr. SPRY (Sortridge) introduced the subject for discussion, and urged the advantages of stamping out the disease, rather than seeking for a cure. He did not undervalue the services of the local police, or deny the fact that Orders of Privy Council and Acts of Parliament had effected some good, but he thought that nine out of ten practical men would say that the Acts of Parliament were lamentably inefficient in action, expensive in process, annoying in operation, and, as the continued virulence of epidemic incontestably proved, singularly unfortunate in arresting the spread of the disease. With respect to the number of cattle in Devon and Cornwall, they were retrograding instead of advancing. In the face of the utter failure of existing arrangements it would be most decidedly beneficial to provide suitable accommodation, and try the experiment of slaughtering foreign cattle at the port of entry, and also to inspect every vessel laden with cattle by a duly qualified inspector; and in the event of any contagious disease existing on board, to separate the healthy from the diseased by the means of hospital accommodation, as well also as the thorough cleansing and disinfecting the ship on board which such contagious disease exists. He moved "That in the opinion of this Chamber the present rules and regulations under which foreign cattle are imported into this country are lamentably inefficient in operation as regards their dealing with contagious diseases, and this Chamber is unanimously of opinion that the only method of effectually dealing with such diseases is by the providing suitable and necessary buildings for the compulsory slaughter of all foreign cattle at the port of entry."

Mr. BARNETT, V.S., said they wanted prevention rather than remedies. The motion spoke too exclusively of foreign cattle, as there was infinitely more danger in landing Irish cattle than landing animals from Spain. Existing orders regarding foot-and-mouth disease were not properly enforced. In Plymouth, Spanish cattle were inspected on landing by a veterinary surgeon, whilst Irish cattle were examined by an inspector of nuisances. A veterinary surgeon could discover more disease in two minutes than an inspector of nuisances could in two hours. He objected to the idea of a policeman understanding the presence and progress of a disease in cattle. How agriculturists could expect the foot-and-mouth disease to diminish under the present mode of carrying out the regulations for providing against its spreading he could not tell. It was as likely that cattle coming from the Smithfield Show would bring foot-and-mouth disease to Plymouth, as any imported from abroad.

Mr. HENRY CLARK spoke of the small attendance at the meeting. Men should not only subscribe to Chambers of Agriculture, but should also attend meetings and discuss the questions introduced. If members did not come to the meetings they had better cease connection with it altogether, as its promoters would then know its real position. He could not

agree with Mr. Spry's motion, for if all foreign cattle were slaughtered as soon as landed, they would kill not only the fat cattle, but also the store stock, and agriculturists would then be in a very poor way. Store stocks were at present very scarce. The cattle imports into the United Kingdom for the ten months ending 31st of October last were—Oxen and bulls, 120,417; cows, 62,451; calves, 365,049; sheep, 792,332. If all these were slaughtered on landing, could the supply of store stock be kept up by breeding? Many Chambers were in favour of slaughtering all fat stock when landed—although some Chambers did not go so far as that—and putting the store stock into a certain period of quarantine. Mr. Spry's motion was confined to foreign cattle, but more disease was brought from Ireland than from any foreign port; but were they to slaughter all stock coming from Ireland as soon as landed, or were they to put store stock into quarantine? If they agreed to the latter how could it be carried out? Liverpool imported something like 10,000 store cattle from Ireland weekly, and could all these be kept in quarantine for any time? Such a plan would practically prevent the importation of store stock at all from Ireland. Some farmers had said it would be better even to have the foot-and-mouth disease in the country, if they made the best of it, than to keep store cattle in quarantine. One result would be increased prices for meat. Sir Massey Lopes had said in that town that he (Mr. Clark) could not instance a case of foot-and-mouth disease in England before 1844; which, if so, would lead to the assumption that the disease was just brought to the country by the free importation of foreign cattle. He (Mr. Clark) was unable to speak on the subject at that time, but he had since seen that in 1840 Professor Sewell wrote an article in the Royal Agricultural Journal on the foot-and-mouth disease, which then existed in England. The disease was in Essex in 1839, it spread to Norfolk, and in 1841 cattle on a farm in Devonshire, belonging to his father, were attacked with it.

Mr. SPEAR stated that in 1840 cattle died from foot-and-mouth disease on a farm he was acquainted with in that neighbourhood, and the disease spread to his own premises.

Mr. SPRY knew it was perfectly impossible to slaughter all the store cattle brought into this country. He only framed his motion in order to provoke discussion, and would alter it in any way to meet the unanimous opinion of the Chamber.

Mr. S. ROSEVEARE was sure all store stock could not be slaughtered when landed, although something might be done regarding the fat stock. In support of the view that contagious diseases were imported into England he pointed out that the diseases were almost confined to localities near the landing ports. Fat cattle should be slaughtered at the port of debarkation.

Mr. N. STEVENS objected to the words in the motion to provide buildings for slaughtering cattle, contending that beyond providing that the slaughtering should take place, they need do nothing. The question of putting store stock in quarantine should be well considered before long periods of quarantine were advised. He blamed farmers for not attending meetings of chambers of agriculture, and there discussing their grievances, which was the only means they could take in order to get evils remedied.

Mr. CANN said the arguments against the great expense of putting store cattle in quarantine might be overcome, as a higher price would always be given for animals if the purchasers were sure they were free from the disease. Store cattle were as likely to spread the disease as fat.

The motion was ultimately put in the following terms and carried: "In the opinion of this Chamber the present rules and regulations under which foreign cattle are imported into this country are lamentably inefficient in operation as regards the dealing with contagious diseases, and this Chamber is unanimously of opinion that no method for dealing with such diseases will be effectual that does not include the compulsory slaughter of foreign fat stock at the landing ports, and the disinfection of the hides before removed."

It was agreed to adjourn the discussion regarding the best means of dealing with imported store cattle to the 4th of January next.

THE LEEDS FAT CATTLE SHOW.

This annual show was held in the cattle sheds, Leeds. Coming after Birmingham, Islington, and York, this has always a special interest attaching to it from the meeting of "stars" for a final performance before they retire from the stage, to appear again only in the Christmas shambles. The entries gave assurance that in this point of view the show would continue to maintain its character, and it has happened so. Many battles have been fought over again, several important decisions have been reversed, and some "new Richmonds" have come into the field, and established themselves as worthy of public honours. The attendance too has been equal to that of last year, and far in excess of previous years. On the evenings of all the days the avenues were crowded with spectators, the daily average of admissions being about 8,000. Still the meeting has not been as brilliant as heretofore. The gaiety and *esprit*, were usually marked characteristics of the Leeds meeting were absent. Smith's model band discoursed sweet music, but the crowd seemed to move on calmly and unmoved, as though it was business *only* to-day and not pleasure. And truly it was so. It was not a time for pleasure; a terrible anxiety weighed on all men's spirits, and each countenance was the reflex of his sorrowful heart. The question of "What is the latest from Sandringham?" was the preface to every conversation—points, quality, wool and feather.

As a farmer, breeder, and sportsman, the Prince has become familiar with Yorkshire and Yorkshiremen—as, indeed, with Englishmen generally—while his kindness of heart and urbanity of manner have made him personally loved by the populations amongst which he has moved so freely. The demonstrations of this love for the suffering Prince shown by the masses on this occasion, were strikingly evidenced in many ways; but there was one which we cannot omit to record as showing how slight is the hold which Republicanism has yet obtained over the heart of England. Thus, when the band, instead of playing the National Anthem, on closing for the night, gave "God bless the Prince of Wales," the whole crowd surged, rather than moved individually, to the orchestra, and gave enthusiastic demonstrations of loyalty, some cheering loudly, some waving handkerchiefs, and some throwing up hats, but all joining in the chorus, '*God bless the Prince of Wales!*' Surely never prayer came forth more spontaneously than this, as none could be more heartfelt.

The many empty stalls amongst the cattle, arising from the prevalence of foot-and-mouth disease was a disadvantage common to all the shows of the season, and Leeds was especially fortunate in bringing so many public animals into the yard, safe and well. Out of an entry of 91 cattle, about 20 were unable to put in an appearance. Of course only about a moiety of these were prevented coming by disease. Several beaten animals are usually wisely held back by their owners, from shows that occur later in the season.

The Shorthorns were in three classes, and numbered 24. The competition was good in all, but remarkable in that of oxen. There was the tournament of the season, the meeting of Greek with Greek. Hector dragged over the course by Achilles; the fall of Front de Beuf before the Black Knight; Brian de Bois Gilbert pale at the touch of Ivanhoe's lance at Temple Stow; and Robin Hood's thrashing by the Pindar of Wakefield, were results of the "tug of war" no more expected than the defeat of the Birmingham and Smithfield Cup ox, and Lord Zetland's York Cup ox, by Mr. Drysdale's York third-prize ox.

We described Lord Zetland's ox at York last week. We have seen him again, and though he has lost bloom since then, he is still a fine Shorthorn, and entitled to beat Mr. Drysdale's red ox. Lord Zetland's ox may be a little light forward, and not stand as wide as Mr. Drysdale's, but he has style, hair, and touch, wonderful loin and back ribs, to which the red ox has no claim. The Scotch animal, moreover, cannot be a Shorthorn, if judged by looks. He has little of the character of the breed. He has no beef comparatively on his back and loins, is rough on his rumps and on his chine. He is thick-fleshed and a capital weigher, and a butcher may think him entitled to beat the Smithfield and York animals. Few breeders will confirm the verdict. The remarks that apply to Lord Zetland's ox apply more fully to Mr. Stratton's white, placed second here. He is better than the winner immeasurably, and better than Lord Zetland's entry. The two white animals are equally full of Shorthorn style, handling, and shape; but the south country beast beats Lord Zetland's in the forequarter and in the thigh, and is on the whole a more level beast. Lord Zetland's ox has loin and back ribs so excessively good that they make his outline not perfect. The defeat of the two best Shorthorn oxen of Birmingham, Smithfield, and York is simply a *fluke*, for which somebody is accountable, but by which nobody will be misled. The best cow was Mr. Cattley's second prize York animal. We described her last week. She is full of quality, and in some points better than Mr. Willis' big old cow. They do not, however, meet at Leeds. Mr. Outhwaite's cow was a good second. The heifer class was a creditable one of six. Sir W. Trevelyan here followed up his York success with the heifer bred by Mr. Stamper, which we characterised as about A. I. on the ground, and which on that occasion took the prize, and also Mayor's Cup, as best Shorthorn in the yard. The York placing is carried out in the second prize also—this going to Lord Zetland. The third prize does not follow; Mr. Robson's York entry being here beaten by a very neat, thick animal belonging to H. F. M. Ingram, Temple Newsam. Mr. Robson's young heifer is not nearly up; she will go on, and come another day. Mr. Drysdale's red ox takes the President's Cup for best animal on the ground, and Leeds Innkeepers' Plate for best Shorthorn. The judges are, it appears, at least consistent, if not something more, it being certainly consistent to make the animal beating the Smithfield and York "best beasts" win the plate for best Shorthorn animal here; but it may possibly seem to some not so much consistent as persistent (in error?) to give that animal the cup as the best animal on the show-ground. The premium for the best cross-bred ox or Irish ox went to Scotland. Mr. Bruce's first prize is a fine cylindrical mass of beef, somewhat coarse in bone. Mr. McCombie's red ox, the winner at York last week, is third. We then fully described him as a very heavy good animal. He is somewhat coarse on the shoulder, but weighs at least 110 stones, and is as level as a table on back and sides. Mr. Ripley's ox, which obtains second, is a first appearance this year, and though he is a good animal and has ribs, hips, and loins thoroughly covered, is deficient at the breast point, and not nearly equal to Mr. McCombie's ox in depth and breadth as a fat ox. This class is here first-rate. Mr. Bruce's ox, the winner in this class, takes the cup for best beast in the cross-breeds classes. Sir W. C. Trevelyan, Mr. H. M. Ingram, and Mr. Reid take the

crossbred heifer prizes in their order. Sir W. C. Trevelyan's animal is large and level, and full of quality, and fairly beats Mr. Reid's York second-prize animal, who now takes third. She is common looking in bone; and is down in back and belly. The Scotch classes were not well filled. The four classes had only 14 entries. Here York was really repeated. Mr. Reid's polled ox and heifer took first in their respective classes, Lord Harewood also taking first and second with Horned Highlanders, as at York. A second inspection justifies us in stating that this winner is one of the best Highlanders ever shown. Mr. Harrison's two heifers are first and second at Leeds, as at York. "Such a pair" are seldom seen; and we credit the Highlander most cheerfully with the guerdon of success.

In the tenant farmers' classes there was a capital competition, the entries being 38 in four classes. Mr. Pulver's second prize at York was here best ox, Mr. Tasker, of Naburn, taking second with a good animal, the first prize district ox at York; and Mr. Lancaster's third prize ox on the young class takes same place here. Mr. Tasker takes first in the cow class for tenant farmers with a long, heavy animal, and Mr. McCombie wins the second. In the heifers the first prize was won easily with Mr. MacPherson's 2 yrs. 10 months' heifer, the winner in cross-bred heifers at York. The second prize went to Mr. Sharp, of Kettering, and the third to Mr. Ripley, Kirk Hammerton. The prize animal is a pretty animal with a dark nose, and Mr. Ripley's young heifer is full of quality, but not good in the loin. Mr. MacPherson's heifer takes the cup for best animal in the tenants' classes, and no one can grumble at such an honour being awarded to her. The fat cow in milk prize went to Mr. Drake, Leeds, for a great good cow in milk and beef. She took also a £5 cup in this class. There were 17 entries, and nearly all came to the post, and close competition ensued. A cow that can milk and keep up condition is a valuable animal; but this can do more—she can make milk and meat simultaneously. The second prize went to Mr. B. Bird-sall, Woodhouse, Leeds, and the third to Mr. Shepherd, Leeds, for two capital Yorkshire cows.

The show of sheep was, on the whole, in numbers rather scant; but there were some prime animals brought out. In the horned Scotch there was a great competition as well as a good one. Mr. Jas. Bruce, of Fochabers, N.B., took first and second with the best animals of this class which we have met with this year. Lord Crawford, Lord Grantley, Mr. Crossley, Mr. Bridon, and others sent some well-fed blackfaces. In cross-breds Mr. Bruce also came first, beating Mr. Agar's York prize animals. In "Downs and other breeds" Lord Wenlock, who was beaten by Lord Zetland at York, turned the tables, and took first honours, leaving Lord Zetland the second prize; but Lord Wenlock's prize sheep were better than those he exhibited at York. The Leicester or longwool class produced but one entry, as at York, but that entry was a marvellous good one. Indeed, Mr. Byron's three Lincoln wethers were worthy of the prize and the cup for the best pen of sheep on the ground, which, in the face of such doughty champions as the two noble lords, they obtained. They alone fully sustained the honour of the longwools against all comers. We think we never saw better longwools, but certainly never better sheep of any other breed.

The pig show comprised 75 pens in 9 classes—a number ensuring a good competition generally. In some classes there were a dozen capital animals. We are not going to attempt to describe the points of prize pigs. The work is in vain. They are now moulded to shape, and the best individuals are types of large numbers of the same shape and make. Fat

is their normal condition, as we find them at the cottage homes of the West Riding, and fat they are at the pig shows. Sleekness is their beauty, and somnolence their habit, and when they have attained both they become prize takers! And on this occasion Messrs. Duckering and Sons, Mr. Bramfel, Mr. Ambler, and Mr. Clement Beswick Roysds have brought out specimens worthy of their high standing as breeders of the useful animal. In the farms and cottages of the West Riding, however, Competitors have not been found wanting, to compete, and successfully, against the swell breeders. Mrs. Mary Wilson, Richmond Hill, Leeds, takes first prize for middle-bred fat pig, and Mr. Joseph Bartle, Hunslet-road, Leeds, for one of the same breed exceeding 12 months old. Mr. Geo. Cochrane Seacrof gets a first for small-bred fat pig, and Mr. John Ballance, Britton-terrace, Hulton, Leeds, has the first-prize sow, small breed; while Mr. Henton, Leeds, wins the first prize for three pork-pigs. Mary Wilson and other locals get several more lower prizes, and the crack breeders have many seconds and thirds where the local breeders take firsts. Messrs. Duckering and Son have first and second for fat pig large breed, second for fat pig middle-bred, under 12 months, where Mr. Bramfit comes in. Messrs. Duckering also get first prize fat sow, middle breed, and third for small breed under 12 months old, as well as third for fat sow, small breed. Mr. Ambler, Mr. Roysds, and Mr. Bramfit have also their successes.

The poultry show comprised 411 pens in 41 classes, an average competition of 10; and pigeons 248 in 17 classes, an average of 15. Rabbits numbered 47 in 5 classes. The popularity of these fancy animals in Yorkshire is only equalled by the skill which is brought to bear in their cultivation. The success of these breeders has been commensurate with the pains taken, and the value of the "pets" has increased in the same ratio as their excellence; £100 for a game bird is the sale price in many instances put down in the catalogue, and 50 gs. for a pointer pigeon is no uncommon thing to see in the same list. To those who are interested in these minor breeds of domestic pets, this show has at once been a treat and a school of instruction. Our limits will not allow us to say more than this. To attempt to point out individual merit would be injustice, where that merit is so great and so varied that it cannot be fully illustrated by a single pen. Let us not forget a very important item in the story of the Leeds Cattle Show. The Judges were—Fat cattle and sheep: Mr. James Dixon, Berwick-upon-Tweed; Mr. Edmund Parker, Newton, near Castleford; Mr. Wilkinson, Shearwater, Hull. Pigs: Mr. Peter Eden, Salford, Manchester; Mr. George Smart, Woodhouse Grange, Aberford, South Milford. At York last week the judges were—Cattle: Mr. W. Hill, of Wetherley, and Mr. T. Scott, of Grantly, Ripon; of sheep, Mr. G. Walmsley, of Rudston, Bridlington, and Mr. W. Wood, of York; of pigs, Mr. R. Fawcett, of Osbaldwick, and Mr. J. Shilleto, of York.

FAT CATTLE SHOWS.

WEST OF ENGLAND FAT CATTLE AND POULTRY SHOW.—This show opened at Plymouth, and Somerset breeders have been very successful with their variety of Devon cattle. In the young steer class Mr. Walter Farthing took first prize for a beast bred by himself. In the old steer class he had their honours with a three-years and nine months' animal, bred by Sir A. Hood, St. Audries Williton. In the class for heifers not exceeding four years Mr. Farthing was first with a two years and five months' beast, and with the same animal he won an extra prize, for the best cow or heifer bred and fed by exhibitor. In the Shorthorn classes Mr. W. H. Hewett, of Norton Court, Taun-

ton, obtained the first prize in the steer class under three years and three months with a steer two years and eight months old, bred by himself. Mr. J. S. Bult, of Dodhill, Kingston, Taunton, ranked second with a two years and nine months' beast of his own breeding. In the extra stock classes Mr. Farthing again came to the front. In the oxen or steer class he showed the Shorthorn which has taken second prizes at Islington and Birmingham this year, and this ox now took a special prize of 10 gs. for the best ox or steer in the yard. In the cow and heifer extra class Mr. Farthing had it again all his own way, taking the first prize of the class, and also 10 gs. given for the best cow or heifer in the yard. This animal is a Devon cow, four years and three months old, bred by exhibitor. The poultry exhibition was very good. The dinner was put off in consequence of the illness of the Prince of Wales.

THE LIVERPOOL FAT CATTLE SHOW.—Amongst the cattle was the heifer belonging to Her Majesty the Queen which took the first prize at the Smithfield and Birmingham shows; and a Devon heifer, the property of His Royal Highness the Prince of Wales, but owing to the present circumstances they did not enter for competition. In class 1, for the best ox of any breed, the first, second, and third prizes were carried off by an Irish bred ox. The first and second prizes were awarded to Mr. McCombie, M.P., Aberdeen, for the best polled or Aberdeen ox; whilst Mr. Riggs, of Kirkeudbright, took the first and second prizes for heifers of the same breed. The first, second, and third prizes for best cow, any age or breed, were taken by an Irish bred cow; as were also the first, second, and third prizes for the best heifer of any age or breed. Mr. Riggs took the first prize for the best heifer, of any age or breed, fed in England or Scotland. Ireland also took the first and second prizes for the best pair of out-fed oxen; and the first, second, and third prizes for the best pair of out-fed heifers; and the first, second, and third prizes for the best pair of out-fed cows. The first prize for the best pair of oxen was awarded to a pair from Ireland; and the first, second, and third prizes were likewise taken by the best pair of cows, which were bred in Ireland. The first, second, and third prizes for the best pair of heifers were also taken by an Irish-bred pair. The first and second prizes for the best pure-bred Shorthorn heifer were also taken by Irish heifers. The show of sheep was good, and in this, as in the show of cattle, the greater number of the prizes were awarded to Irish breeds. In fact, out of a large number of pens only two prizes were awarded to English pens.

TREDEGAR AGRICULTURAL SHOW AT NEWPORT.—Wednesday was this year the chief show day, the interest on the first day being centered in the horses. There were seventeen entries in the light weights, but only eleven came forward. The first prize was won by Col. Lindsay's May Queen, and the second by Mr. Mansfield's The Lamb. There were 143 entries in the cattle classes, amongst which there was a short show of Herefords. There were only two entries for the silver cup for the best yearling bull of the Hereford breed, and Mr. Rees Keeme, Pencreeg, Caerleon, was awarded the prize, but no small dissatisfaction was expressed at the decision. For the cup given for the best yearling heifer Mr. J. Morris, of Madley, showed a Hereford heifer, which took the second prize at the Wolverhampton meeting of the Royal Agricultural Society, and was one of the pair that took first prize at Hereford in October, but was here beaten by a Shorthorn, a little gem. For the cup for the best stock bull above two years old there were six Herefords and seven Shorthorns exhibited, among them the Hereford Dulas, and a Shorthorn shown by Mr. G. Garne, of Chipping Norton. The premiership was awarded to the Shorthorn. The plate of 20 guineas for the best male animal in the yard was awarded to Mr. Warren Evans's bull Monaghty 3rd, who was also awarded the prize for the best bull with cow and offspring. There were only thirty entries in the sheep classes, which would seem, by the way, a small number for a show of this standing. The bulk of them came from Glamorganshire. Only two pens of Welsh mountains were shown, Breconshire furnishing one and Monmouthshire the other. Pigs were represented by 46 entries, and were pretty equally distributed over a large area. Newport has done very well in securing prizes for these useful animals. The horses numbered 124 entries. Many of the prizes this year had very large numbers of competitors, and in some cases

there was difficulty in awarding prizes, so keen was the competition.

IPSWICH FAT CATTLE SHOW.—The prize for the best fat pure or cross-bred steer, under 30 months, was taken by Mr. Green, of East Donyland, with a very fine animal, weighing over 80 stone. The crack beast in the next class (over 30 months) was Mr. Frost's fine four-year-old Shorthorn, which took the first prize, beating Mr. J. J. Colman's polled steer, the second-prize winner in the Shorthorn class at Smithfield, with which the competition was very close. The heaviest bullock in the class was that exhibited by Mr. Woods, of Oulton, Lowestoft, a winner at the Mutford and Lotheringland show last summer. In the next class (fat heifers, pure and cross-bred, not exceeding four years old) Mr. Green was to the front again with a pretty little white heifer, but rather deficient in the hind quarters, a first-prize winner at the Essex show at Romford. The premium for the best fat cow was taken by Mr. N. Catchpole, of Ipswich, with a handsome animal, winner of the first prize at Beccles, second at Sudbury, and second at Ipswich in 1869. The "any breed" class was a very poor one, the only beasts worth looking at being a couple of stalwart Highlanders, whose claims were, however, ignored in favour of Mr. R. Cooke's Shorthorns. The four Shorthorns shown by Mr. G. Symonds, of Botesdale, for the £10 cup, were splendid, both for size and symmetry. In addition to the ordinary prizes, the president offered a special prize of £10 10s. for the best beast in the yard, Messrs. Webber, Hedge, and Co., supplementing this excellent premium by a ton of their best oilcake. The judging of the different prize animals for the blue ribbon of the show was watched with great interest. The competition by between Mr. Frost's (Wyvenhoe) old Shorthorn and Mr. Green's younger animal. Eventually the judges gave the award to the older and heavier beast. Sheep: The show of sheep was the best we have seen in Suffolk—considerably superior to that at Beccles in the summer. For the best pen of short-wooled sheep under 23 months there were nine entries; the judges awarded the first prize to Mr. Charles Boby, of Stutton. Mr. Overman was first for short-wooled wethers over 23 months, and also took the prize for cross-breds under 23, so he had every reason to be contented. The prize for the best 20 fat sheep of any age or breed was won by a nice lot sent by Mr. J. Smith, of Hasketon. Pigs: Some fine porkers were on the ground, conspicuous among them Lord Rendlesham's two-year-old sow, which credited his lordship with both the five-guinea special prizes presented by Mr. A. Ogilvie for the best sow and the best animals in the yard.

THE MALTON CHRISTMAS FAT STOCK SALES.—The results of the sales held at the fortnight fair, by Mr. Boulton, last month, were as follow:—Bullock, belonging to the executors of the late Mr. John Scott (Mr. Walter Taylor), £42; bullock, belonging to Mr. Cadman, Broughton (Mr. Ewbank), £38 2s. 6d.; bullock, belonging to Mr. Fenwick, Swinton (Mr. Daek Grosmont), £63; five heifers, ditto, £125; two bullocks, belonging to Captain Copperthwaite, £52 7s. 6d.; bullock and heifer, belonging to Mr. Robson, Howbridge, £11 10s.; six heifers, belonging to Mr. Hudson, Howsham, £124 7s. 6d.; bullock and heifer, belonging to Sir George Cholmley, £58 5s.; two bullocks and one heifer, belonging to Mr. Miles, Heslerton, £63 7s. 6d.; two heifers and one bullock, belonging to Mr. Wilson, Whitwell, £79 10s.; two heifers, belonging to Mr. Wilson, Firby, £45 12s. 6d.; four bullocks, from Mr. Cook, of Thivendale, £107 12s. 6d.; one heifer, from Mr. Cook, of Sutton, £29 15s.; two heifers, from Mr. Smith, of Mowthorpe, £64 10s.; also upwards of twenty fat beasts, from £14 to £18 each.

PENRITH ANNUAL FAT STOCK SHOW.—This annual show was held at the Agricultural Hall, when the whole of the animals exhibited were of a superior character. The following are the principal prize winners:—For sheep, the Earl of Lonsdale, Messrs. H. M. Frazer, J. C. Lancaster, J. R. Bridson, L. Harrison, R. Thompson, Captain Gandy. For cattle, Messrs. G. C. Wilson, Lewthwaite, J. Birkett, T. Hunter, Sir George Musgrave, and Mrs. Ann Speak. The total amount realised by the sale of the competing sheep was £1,033 16s. 3d., or an average of 71s. each; and 54 prize cattle realised £1,926 5s., an average of £35 13s. 5d. each.

THE FARMERS' CLUB ANNUAL DINNER.

The annual dinner took place on Tuesday, December 5, at the Salisbury Hotel. About 100 gentlemen were present, the chairman of the year, Mr. J. B. Spearing, presiding, while Mr. H. Cheffins, the chairman of the Club for next year occupied the vice-chair. The dinner itself was worthy of the growing reputation of the Salisbury, being altogether of the best quality, and admirably served. The musical arrangements, which were very satisfactory, were under the direction of Mr. Seymour Smith, who was assisted by Mr. Dawson and Mr. R. Mason.

The CHAIRMAN, in proposing "The Queen," observed, that at this period, when all supposed defects were so freely discussed, it was satisfactory to know that they lived under a monarch, who was at once popular and powerful—powerful, not so much because she ruled over a vast empire, as because she reigned in the hearts and affections of a loyal people, and did not wish to deny liberty of speech even to those who desired to overthrow the Throne and the Constitution.

The toast was drunk with great enthusiasm.

The CHAIRMAN next proposed "His Royal Highness the Prince of Wales, the Princess of Wales, and the rest of the Royal Family." He congratulated the company that the most recent bulletins with regard to the heir apparent were satisfactory, and warranted the hope that ere long His Royal Highness would be restored to his usual state of health. They all knew that the Prince took the greatest interest in agriculture, as evidenced by the excellence of the animals which he exhibited at Birmingham, and now at the Show at Islington.

This toast having been cordially responded to, was followed by that of "The Army, the Navy, the Militia, and the Volunteers."

The CHAIRMAN then said: Gentlemen, I have now to propose what may be considered the toast of the evening, viz.: "Success to the Farmers' Club—and thanks to those gentlemen who have read Papers during the past year." This Club has now existed for 27 years, and it is now, not merely holding its own, but gradually increasing in numbers, in influence, and in funds. During that long period many old and familiar faces have passed away from us, and it is a painful duty for the chairman of each year to record the names of some of those who have since the last annual meeting been removed by death. On the present occasion I have to mention the names of Lord Berners, Mr. John Clayden, Mr. George Jackson, Mr. Edmunds, and Mr. Richard Stratton—men who were well known in this Club and duly appreciated by us all. The duty which I have undertaken of proposing this toast is not an arduous one, because, as will be seen from the report submitted by the committee to the members at the annual meeting, the Club is in a very satisfactory and flourishing condition. The subjects which have been discussed during the past year are of a most interesting and practical nature, and I am sure that the thanks which I propose to the gentlemen who introduced them will be most freely accorded. In February we had a discussion on "English Cheese Factories—how to establish and how to manage them," introduced by Mr. J. Coleman; in March, on "The Supply of English Cavalry Horses," introduced by Mr. E. Tattersall; in April, on "The Growth of Cabbage and kindred crops," introduced by Mr. Clement Cadle; in May, on the question "How to Hire and How to Let a Farm," introduced by Mr. Mechi; in November, on "The Agricultural Labourer—his Employment, Wages, and Education," introduced by Mr. Clare Sewell Read, M.P.; and last night we had a discussion on "Breeding—Facts and Principles," introduced by Mr. J. K. Fowler. I earnestly hope that many of our younger members will, before the meeting of the committee in January, send in proposals for subjects of discussion next year; for unless we keep on importing young blood and getting fresh subjects of interest to agriculture, we shall not, I fear, be enabled to maintain the usefulness of the Club; while if my suggestion be acted upon, there may be an equally good account to be rendered at the end of next year. In looking back to the discussions of former years I have

found that there is scarcely any important question connected with agriculture which has not been considered; and I think, therefore, it must be admitted by all that the Club has been doing useful work, and has deserved well of the country. There are, indeed, some persons who appear to think otherwise, perhaps because they expect too much from the Farmers' Club. For instance, if a man takes a farm that is overstocked with game, or has insufficient cottage accommodation, or is too highly rented, or is encumbered with a lot of absurd covenants, which when he agreed to them he knew he could not perform, he thinks, perhaps, that the Farmers' Club ought to reform all that and release him from his difficulties by an appeal to the Legislature. I say that that man is expecting too much from us. If one thing be more required than another in tenant farmers as a body, it is that they should be true to themselves (cheers). If we are not true to ourselves we can do no good either for ourselves or for our landlords, and I may add that in all such cases the landlord is the first to suffer in the long run. Gentlemen, I will not detain you by making a long speech. I have said what I had to say, and now propose the toast (loud cheers).

The toast was drunk with cordiality.

Mr. A. PELL, M.P., said it was not without some feeling of regret that he rose to propose "The Chairman," as that duty was assigned to him in consequence of the unavoidable absence of one to whom it had usually been confided; he need scarcely say that he alluded to their excellent friend—a friend of long acquaintance, and an old member of that Club—Mr. Clare Sewell Read. Mr. Read had a sharp attack of what he called his "old enemy bronchitis," and he was sorry to say that it was not unlikely that he would not be well enough to come up to town that week. He was not ashamed to confess that in his public capacity he had to some extent looked upon Mr. Read as his master, feeling that he could hardly be wrong in following in his steps, and taking his advice when he required the opinion of a second person for his own guidance; and he hoped that his friend would soon again come forth in public with renewed health and strength. In an assembly like that, which comprised men who ranged themselves, some with one and some with the other of the two great political parties in the kingdom, he must be careful not to make any remarks in a Conservative or Tory spirit. He could not, however, help observing that the two old parties into which the country was entirely divided up to a few years ago—he meant, of course, the Whigs and the Tories—seemed now to be resolving themselves into other forms, and would soon be, if they were not already to a great extent, the communist or town party on the one side, and the party connected with real estate and rural life on the other. He might assume, he thought, that all the members of that Club, being connected in some way with the management or cultivation of the soil, must be practically, in the common sense of the word, countrymen, in contradistinction to those who were termed townsmen; and he was reminded that two-thirds of the members of that Club must belong to the vocation of agriculture in order to give it that distinct character which entitled it to the name of "The Farmers' Club." That being the case, he thought that without giving offence to the greatest Liberal in that room or running into the extreme of Toryism, he might congratulate the Club on the position which agriculturists as a body occupied as a useful auxiliary of the cause of good order and stable Government. It had been repeatedly stated that the occupiers of the soil were slow to approach new ideas, and that it was very difficult to get them to assent to any improvement because they were bigoted in favour of whatever was old. It did not follow that an idea was bad because it was old. He would take leave to assert that farmers as a body were ready to adopt new ideas both with regard to the manner of conducting their own business and with regard to public affairs, when they could be proved to be sound; but on the other hand, he must confess on their behalf that it would be difficult to eradicate from the

minds of the cultivators of the soil the idea that the present form of government in this country was practically the best form that it could possess (loud cheers), that a greater amount of true liberty was to be found in this happy island than in any country on the European continent or elsewhere; and that Republicanism might set up a greater tyrant, or impose a greater amount of tyranny than was ever seen in connection with the greatest despot or despotism that ever oppressed human beings. The tyranny of enormous majorities in large towns—and he wished to keep distinctly in view the difference between town life and country life—might, in his opinion, be more galling than that of any single despot that ever ruled a country; and he believed that the class to which he belonged, and which was well represented at that table, if not so valuable as some other classes, was quite as likely to aid in preserving and encouraging real liberty and useful development (cheers). It might be that they were slow speakers and slow thinkers; but that arose perhaps from the nature of the occupation in which they were engaged. If they were as yet a minority (cries of "No, no") they were an increasing minority; they had a great state in the kingdom, and as an English minority, living under the English monarchy, they claimed to take their position side by side and on equal terms with the greatest majority. As regarded their chairman, he wished to observe that, having gone through the list, he found that there were only thirty-three members who were older as regarded the date of election than their present chairman—a fact which alone entitled him to favourable consideration (cheers). The chairman, however, had rendered great services to agriculture, not merely in that Club but elsewhere. It was now something like nineteen years ago since he first appeared before the public as a writer, and a successful writer, on a subject which was then comparatively new to agriculture, namely, the relative advantages of steam as a motive power in agriculture. A prize having been offered by the Royal Agricultural Society of England for the best essay on that subject, it was competed for by many good men and the chairman was the successful competitor. He could not tell them how many times the chairman was unsuccessful between 1852 and 1860—that he probably kept in his own breast (laughter); but in the latter year he obtained from the same Society the prize which it had offered for the best essay on the agriculture of Berkshire. In 1863, when Mr. Bradshaw was chairman of the Club, Mr. Spearing read before that Club a good paper upon the effect of climate on cultivation; and in 1868, when Mr. Clare Sewell Read occupied the chair, he read another excellent paper on the controverted education question. By those four productions he certainly well entitled himself to fill the position which he had occupied with so much success, and in which he had manifested so much kind and gentlemanly feeling during the present year (cheers). Further, for ten years consecutively he had been one of the judges at the Birmingham show—a fact which showed that he was a good practical man as well as a good theorist and a successful writer of essays. Much, however, as he admired the chairman, he should like to see younger heads coming forward as writers and speakers. New ideas were not to be expected from comparatively old men; there was much scope for usefulness in young men apart from their farms and attention to their own business; and if the Nestors of agriculture, and those who seemed to many to adhere to the old rule of thumb, were leavened, as it were, by the influence of the leaders of agricultural thought, there would then be a very good mixture. He now proposed the health of their chairman, Mr. Spearing (loud cheers).

The toast was drunk with the honours.

The CHAIRMAN, in returning thanks, said he could only account for his own selection for the office which he filled, by the fact that the Club had had such strong chairmen for two or three years, that it was thought that a very moderate one would do for one year (laughter).

Mr. J. BROWN proposed "The Royal Agricultural Society of England, the Highland Society of Scotland, and the Royal Agricultural Society of Ireland," coupling with the toast the names of Mr. Masfen and Mr. Garnett, the latter gentleman for the Irish Society. There could be no doubt that all the great agricultural societies were doing useful work in their several spheres. The Farmers' Club supplied a very important want, and no one would attend its discussion meetings without taking back to his own district some useful

ideas. The Royal Agricultural Society periodically planted its standard in some distant part of the country, and diffused most valuable information among farmers; and if it had failed to fulfil all the purposes for which it was established, it was their part to criticise it in a friendly way, and to seek to get it amended where amendment was required.

Mr. MASFEN, in returning thanks for the Royal Agricultural Society of England, said he did not envy the feelings of that man who thought that he lost a day by attending one of the annual gatherings of either of the Societies included in the toast. He believed that the good effect of the meeting in South Staffordshire would be seen for many years; and with regard to the local subscriptions, he was happy to be enabled to state that the £8,000 required for expenses was made up, and that there was a surplus remaining to be disposed of. At the discussion of the Farmers' Club meeting on the previous night, Mr. Congreve complained that gentlemen in his position had great difficulty in getting animals for grazing purposes. Formerly there was one class of men who bred, and another class who fed; but during the last few years meat had reached such a price, that men who bred had thought it worth their while to bring their animals to maturity, and instead of selling to men like Mr. Congreve, they sold to the butcher. As regarded the Highland Society of Scotland, having been one of the judges at its last annual show, held at Perth, he was happy to say that it was a very creditable one, and that there were a great many animals that would have done credit to a show of the Royal Agricultural Society of England or any Society in the world (cheers).

Mr. GARNETT said, as a member of the Royal Agricultural Society of Ireland, he could testify that although only in its infancy as compared with some other Societies, it was a great success, and any one who visited the show last August, at which the Prince of Wales was present, must have felt satisfied that Ireland was not in such a wretched state as some people in this country had represented it to be. Having had 50 years' experience of Irish agriculture, he could declare that the people of that country when treated with justice and firmness—for it was these that were wanted—were not as bad as they were described. He had no wish to touch on political questions, but he could not help saying that as the Irish difficulty had upset many a Government in past times, so he believed that when the present Government came to deal with the education question, they would find themselves upset too. His belief was that although there were in Ireland a few visionary creatures like Sir Charles Dilke, the country would continue to improve, and be in the end firmly united with England, and that Irish farmers would profit by the example of English farmers (cheers).

Mr. H. TRETREW proposed "The Vice-Chairman, Mr. H. Cheffins," one of the oldest members of the Club, and one who had rendered great service to it in many capacities; and he congratulated the company that that gentleman would be the Chairman during the ensuing year. He (Mr. Tretrew) did not concur in the opinion just expressed by Mr. Masfen in reference to the complaint made by Mr. Congreve in the discussion of the preceding evening. No doubt breeding farms were grazing farms; but he did not believe the scarcity of animals complained of by Mr. Congreve was owing to the cause supposed.

Mr. H. CHEFFINS, in returning thanks, said, although he might not be an efficient chairman, he would promise to do his best, and, considering the benefits which he had received through constant association with many of its most distinguished members, he would be ungrateful indeed if he did not endeavour to obtain the approval of the Club. In conclusion he proposed "The Smithfield Club," and spoke of the vast and increasing good which it was conferring on agriculture and the country.

Mr. T. HORLEY, in responding, said no one could deny that the Smithfield Club had conferred great benefit in introducing a better quality of meat than the public could command before it was established. It was an unfortunate circumstance that the foot-and-mouth disease had shown itself in some of the animals sent to the Show; but he thought the Club wisely determined to defer any further action in the matter until February. The disease was now so rife, and had become such a universal epidemic, that some persons thought it should be stamped out as the cattle-plague was. He himself believed that the half-measures at present in operation had no ten-

deney whatever to check the disease, while they were certainly a great hindrance and annoyance to numbers; and unless the owners of stock and the public were prepared to revert to the rigid regulations adopted in the case of rinderpest, he could see no end to the evil.

Mr. KILPIN proposed "The Committee of Management," coupled with the name of Mr. Major Lucas.

After a cordial response to the toast,

Mr. LUCAS said he was proud of belonging to the committee, because so many of his colleagues had rendered great service to the Club. While they took leave of their worthy chairmen that day with regret, they looked forward to the coming one with congratulation (cheers). But however excellent the chairman might be there always sat at his side a gentleman who had always been a most useful and efficient officer of that Club, and he had now, not the task, but the pleasure of proposing the health of their worthy Secretary, Mr. Henry Corbet (cheers). He was sure they would all join heartily with him in wishing health and happiness to a gentleman who had done so much to promote the prosperity of the Club, and who had for so many years performed his duties in an able and satisfactory manner. He knew from observation that Mr. Corbet was an anxious and a jealous Secretary—anxious for the continued usefulness of the Club, and jealous for the interests of agriculture; and he hoped that he would live for many years to promote the interests of the Club in the same astute and successful manner as he had done in the past.

The toast having been drunk with the honours,

Mr. H. CORBET said as the Secretary of that Club he begged to return thanks for the honour which had just been conferred upon him. That was, he was proud to say, the twenty-fifth occasion on which he had had to perform that duty. Holding the position that he did, it might more properly be in his province to speak to the history and position of the Club. He had no explanation to make, no excuses to offer. The report of the committee presented at the annual meeting of the members that day showed that, whether socially or publicly, the position occupied by the Farmers' Club had never been better than it was then. The balance-sheet, audited by gentlemen who were quite independent of the committee, proved that the finances of the Club were never in a better condition. He had that evening heard some encomiums passed on that Club, and on some other institutions of a kindred character. He believed there was no institution which had in its sphere done more good to agriculture than their own. Last year it was his happiness to refer to a colonial newspaper in which a gentleman said that he read the discussions of that Club with more pleasure than he felt in reading the debates of the Legislature of his own colony. Within the last few days there had been a meeting in the Midland Counties of an agricultural Society, which in the summer held an exhibition of stock. That Society thought that during the winter season, instead of going to sleep like a dormouse, it could do better in holding discussion meetings. At the first meeting the chair was occupied by a member of the House of Commons, who spoke, in opening the proceedings, of the extended and extending influence of agriculturists, and referred especially to the beneficial influence exercised by that Club. He would not trust himself to repeat from memory exactly what that gentleman did say, but he believed he acknowledged that no agricultural institution had done more for the advancement and improvement of agriculture (cheers). He (Mr. Corbet) had no fears for the future of that Club socially or financially; what he did fear was lest they should not be able to sustain their programme of discussions. As each year came round he said to himself "What shall we do—what shall we put on the card?" Mr. Pell had spoken of the necessity of introducing young men, new blood, and new ideas. He could assure Mr. Pell that he had just received a number of subjects proposed for discussion, some of which would almost frighten him for their novelty. Looking to the past, Mr. Masfen had spoken of the necessity of greater security on the part of occupiers; and whenever gentlemen talked on that subject they invariably came back to this point—that it was absurd for persons to attempt to farm in the best manner unless they had proper security for the capital which they invested. That was a very honest and a very substantial principle, but it was a principle which belonged to that Club (Hear, hear.)

Through good report and evil report, through absurd abuse and faint praise, under all disadvantages and discouragements, Tenant Right had been advocated and contended for in that Club. After having dropped for a time it rose up again, and he believed that it was destined to ultimate success (cheers). His desire was to say as little as possible about himself and as much as possible about the Club; but he felt greatly obliged to Mr. Lucas for the handsome manner in which he had spoken of his services, and he sincerely thanked them all, individually and collectively, for the reception accorded to the toast (cheers).

The concluding toast was "The visitors."

The company separated soon after 10 o'clock, after spending one of the pleasantest evenings in the annals of the Club.

THE GENERAL ANNUAL MEETING.

At the general annual meeting on Tuesday, December 5th, Mr. J. B. SPEARING, in the chair, the following report from the committee was received and adopted:

A reference to the balance-sheet will furnish the best evidence as to the prosperity of the Farmers' Club, which well maintains its position. Although there have not been so many new members elected in 1871 as in 1870—the accession of strength being 46 against 56—the income is equal to that of the previous year, a fact which speaks to the larger amount of subscriptions paid up. The arrears, indeed, have never been more closely collected; although the committee is still surprised to find that a few members who make continual use of the Club neglect to discharge their obligations in this way, even after repeated applications have been made. If the income will compare favourably with that of previous years the expenditure has been kept well within bounds, and it is long since there has been a better balance at the bank. Some calls, however, will require to be met from time to time on the six additional £20 shares taken in the India Peninsula Railway Company.

Looking to the Club's uses and duties in another direction, it is satisfactory to say that the committee has been enabled to fill in the discussion card with subjects which have been so well-timed and handled as to again command much attention beyond the mere precincts of the Club. There is, indeed, no question but that more and more weight is coming to be attached to these meetings, and to any expression of opinion which may emanate from them. In some proof of this it may be mentioned that the International Decimal Association has sought the support of the Club in an endeavour to obtain some uniform system of weight, and the committee, from its past experience and communications with all the chief agricultural bodies in the kingdom, has been enabled to give its concurrence to a movement which may be almost said to have originated with the Club some years since. A full report of these proceedings has already appeared in the *Club Journal*. The committee has also given its best aid to the French Peasant Farmers' Seed Fund in calling the attention of the members to the object, for which at the outset the committee received an official vote of thanks from that society.

The committee has again to lament the loss of some of its most respected members, as the deaths during the past year include those of Lord Berners, Mr. John Clayden, Mr. George Jackson, of Tattenhall, Mr. Edmunds, of Rugby, and Mr. Richard Stratton. Mr. Clayden was a member of the committee, and, in accordance with rule 12, Mr. T. Horley has been nominated to fill the vacancy.

Mr. Henry Cheffius has been elected chairman of the Club for 1872.

The following members of the committee went out by rotation: T. Congreve, T. B. Dring, J. Dumbrell, C. Howard, J. Howard, M.P., E. M. Major Lucas, F. Neame, R. J. Newton, T. Owen, C. S. Read, M.P., J. B. Spearing, J. Thompson, and A. Voelcker—all of whom were re-elected but Mr. Dumbrell, who was ineligible from non-attendance, and Mr. J. G. King elected on to the committee in his place.

A vote of thanks was past to the auditors, and Messrs. T.

Willson, N. Rix, and E. Purser, jun., elected auditors for the ensuing year.

Mr. Allender gave notice that at the next general meeting he would move "That the attendances of retiring members of the committee be taken on an average of the three preceding years."

The proceedings closed with a vote of thanks to the chairman.

THE LATE RICHARD STRATTON.

More than thirty years ago, Mr. Stratton had a large herd of cattle in Wiltshire, which he kept in two parts; one numbering about fifty cows and heifers, as the ordinary dairy herd; the other about forty head, as the selected herd. Expensive cattle were never bought, but the best heifers were purchased at different fairs, and put into the ordinary herd, where if they proved good beasts and great milkers, their heifers were exalted to the selected herd, and if they in their turn became good milkers and breeders, and were worthy of the promotion, they were retained. In the selection of bulls, Mr. Stratton was most particular, and his custom was to spend a month or six weeks in looking over various stocks for the male animal, selecting him not so much for his great beauty and symmetry as his character, blood, and the excellence of his sire and dam. Phoenix (6290), originally called Byron, was the first pedigree bull, and he was put to a neat but rather plain red and white heifer, supposed to be a pedigree Shorthorn, which Mr. Stratton had refused at one fair and afterwards thought better of and purchased at Highworth. These animals produced Moss Rose, the best heifer calved that year; she afterwards became a prize cow, and on being put to Lottery (4280) (who was bought of Mr. Adkins, of Mileote) gave birth to Young Moss Rose, and mother and daughter produced thirty calves between them. It is from these animals that the largest and best portion of Mr. Stratton's herd has been reared; and although one or two pedigree cows have been bought they have not been retained. Upon good bulls he has chiefly depended: Mr. Hayter's Red Duke (8694), Earl Ducie's Hero of the West (8150), and Mr. Sanday's Nottingham (15014), being among his most favourite sires. Of late years, however, he bred much from the Booth blood through Mr. Barnes' herd, but he never went direct to Warlaby. He had no love for fashionable pedigree, and it was rather by his friend Mr. Bowly's advice that he sent his prize cow Maid of Honour to Seventh Duke of York, and her son the Eighth Duke of York (23808), with James 1st (24202) (a prize-winner by a Booth blood bull, out of Queen Mary, an own sister to Maid of Honour), have been the latest sires used. It is more particularly in the show-yards, and especially at the Birmingham and Smithfield Club Shows that his success as a breeder and exhibitor is so widely known. Since the modest 3 gs. were won at Devizes in 1837 for the best heifer in milk and for the best cow in milk, the amount has swollen to over £5,000, and five gold medals have come from the Smithfield Club alone. At the Royal and local shows he has frequently sold his animals at high figures, chiefly to Australia, where they have been most highly esteemed, and three of his bulls have realised in the colony 400 guineas, 470 gs. and 600 gs. respectively. Portions of his herd have, however, been brought into the sale ring, but no high prices obtained. At the sale in March last, it was remarkable that amid a very large company scarcely half-a-dozen *Herd Book* breeders were present, yet for the general herd of fifty-five head, most of the best being retained, an average of £34 was realised. In fact, Mr. Stratton, a sound, good judge of animal life, studied and practised breeding for the animal's sake more than for fashionable tastes; he went for sound constitutions, good quality of flesh, and abundant milking properties, and looked at a pedigree, not for its long descent, but to assure himself that the immediate ancestors were good, and of a family of good animals. If he were particular to certain points, he would prefer a good back, full thighs, large udder, and a good floor to the chest, as his friend the late Mr. Adkins described it, scorning animals with "no heart and long necks as good dairy cattle." He did not very strongly object to in-and-in breeding, though it was rarely practised; the cross in

Lottery on Lottery's daughter Young Moss Rose, producing Elegance, "a nice stylish cow, a great milker, but not so massive as her dam," was by mistake of the herdsman and not altogether an unsuccessful result, as she produced the Duchesses of Glo'ster, who in their turn produced Maid of Honour and Queen Mary. Eminently successful as an agriculturist, and a great economist in management, he brought out animals that have ranked in the show yards with the Booth, Towneley, and finest cattle of the day; backward as some have considered him, and forward as others have remarked, in his generation, he was nevertheless a man who commanded success, and who was looked up to by his brother farmers of the south as a man in advance of his time. He died on the 15th of August, aged 63 years, and left a large family of five sons and six daughters, one only a minor; the sons, following their father's pursuits, are large occupiers, the four eldest having 6,500 acres among them. Mr. Joseph Stratton, at Alton Prors, Wilts, and Mr. Richard Stratton, of The Duffryn, Monmouthshire, divide their father's herd between them.—*Thornton's Circular*.

ITS NOBBUT ME.

Ya winter neet, I mind it weel,
Oor lads 'ed been at t' fell,
An', bein' tir't, went seun to bed,
An' I sat be mesel.
I hard a jike on t' wi' dow pane,
An' detfly went to see;
Bit when I ax't, "Who's jiken thee?"
Says t' chap, "It's nobbut me!"

"Who's *me*?" says I, "What want ye here?"
Oor fwok ur aw i' bed,"
"I dunnet want your fwok at aw,
It's *thee* I want," he sed.
"What cant'e want wi' me," says I;
"An' who, the deuce, can't be?"
Just tell me who it is, an' than!"—
Says he, "It's nobbut me."

"I want a sweetheart, an' I thowt
Thoo mebbly wad an' aw;
I'd been a bit down t' deal to-neet,
An' thowt 'at I wad eaw:
What, cant'e like me, dus t'e think?"
I think I wad like thee"—
"I dunnet know who 't is," says I
Says he, "It's nobbut me."

We pestit on a canny while,
I thowt his voice I kent;
An' than I steall quite whisht away,
An' oot at' doerer I went.
I ereapp, an' gat 'im be t' ewoat laps,
'Twas dark, he cudden see;
He startit round, an' said, "Who's that?"
Says I, "It's uobbut me."

An' menny a time he com ageaun,
An' menny a time I went.
An' sed, "Who's that 'at 'a jiken thee?"
When gaily weel I kent:
An' mainly what t' seamm answer com,
Fra back o' t' laylick tree;
He sed, "I think thoo knows who't is:
Thoo knows it's nobbut me."

It's twenty years an' mare sen than,
An' ups an' doons we've hed;
An' six fine barns hev blest us beath,
Sen Jim an' me war wed.
An' menny a time I've known 'im steal,
When I'd yan on me knee,
To mak me start, an' than wad laugh—
Ha! Ha! "It's nobbut me."

—John Richardson.

REVIEW OF THE CATTLE TRADE FOR THE PAST MONTH.

The feature in the cattle trade during the past month has been the holding of the annual Christmas Fat Stock Market. The show of beasts on that occasion was tolerably good, but, although the general quality was excellent, it did not exceed expectations. In point of numbers the show was about an average; allowing for the many advantages offered during the past season for the rearing and fattening of cattle the appearance of the beasts was not worthy of any special remark. The Scotch grazers, as usual, carried off the palm, but there were excellent Shorthorns, Herefords, Welsh Runts, and also a few fair conditioned foreign breeds. The trade throughout has been in a rather quiet state. The best Scots and crosses have only occasionally made 6s., the more general quotation being 5s. 8d. to 5s. 10d. per 8lbs.

There has been a fair show of sheep in the pens. Although trade has not been active, a firm tone has been generally apparent, and prices have been fairly maintained. The best Downs and half-breeds have sold at 6s. 8d. to 6s. 10d., and in some instances 7s. per 8lbs.

For calves the inquiry has been to a moderate extent, at full prices. Pigs have commanded a fair amount of attention.

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

	Dec., 1871.	Dec., 1870.	Dec., 1869.	Dec., 1868.
From Lincolnshire, Leicestershire and Northamptonshire.....	7,500	8,500	7,620	7,545
Norfolk, Suffolk, Essex, and Cambridgeshire	1,600	1,620	1,900	550
Other parts of England	1,390	1,830	2,480	2,330
Scotland	1,754	2,054	1,954	2,190
Ireland	400	1,820	2,990	1,292

The total imports of foreign stock into London during the past month have been as under:

	Head.
Beasts	6,308
Sheep	31,861
Calves	906
Pigs	215

Total 42,290

Corresponding period in 1870.....	51,888
" 1869.....	44,815
" 1868.....	17,231
" 1867.....	38,336
" 1866.....	34,658
" 1865.....	66,721

HOP MARKET.

BOROUGH, FRIDAY, Dec. 22.—The close approach of Christmas suspends operations, and no business of importance is passing. Prices continue firm, the quantity of new Hops unsold being now confined to a small compass. The Belgian market is quiet, with slightly easier quotations. Latest advices from New York state the markets have slightly improved, and prices for all grades, both new and old, to be extremely firm.

CANTERBURY HOP MARKET, (Saturday last).—The trade has closed to-day for the present. A retail demand has prevailed this week. Stock of 1871 very low, and prices firm.

THE FEVERSHAM MEMORIAL.—The memorial of the late Lord Feversham, which has been erected in Hemsley, has been publicly unveiled. It consists of a Gothic canopy containing a statue of the deceased, and terminating in a cross. The structure is enriched with elaborate carving, is approached by a four-stepped base, and has a general resemblance on a small scale to the Scott monument at Edinburgh. It is fifty feet in height, and has been built from silicious sandstone obtained from Bilsdale and Farndale quarries. The statue is of Sicilian marble, and represents the deceased nobleman in his robes as a peer, and as if in the act of delivering an address. It is from the chisel of Mr. Noble. As a piece of sculpture it has been well conceived and wrought out, and conveys an accurate likeness of the late Earl. The Gothic structure protecting the statue has been erected from a design supplied by Mr. G. Gilbert Scott. Situated in the centre of the Market-place, the memorial adds much to the appearance of Hemsley. It has cost about £1,000. The statue is the gift of the family. The cross, the foundation-stone of which was laid in May, 1869, was completed a year ago, but it was only on Thursday that the statue was placed. On the south panel of the pedestal, the following inscription will be carved: To William, second Baron Feversham, this monument is erected by his tenants, friends, and relatives, who cherish his memory with gratitude and affection. Born 1798; died 1867.

LORD POWIS' SLAUGHTER-HOUSE PRIZE.—This offer of £20 for the best instrument that should be an efficient substitute for the pole-ax, has so far resulted in a complete failure. Only two competitors appeared at the trial on Thursday, one of whom declined to use his double-edged dagger; while the other invention, a long tube worked by a spring, was simply ineffective. If such absurd trials be proceeded with, it is questionable whether the Society for the Prevention of Cruelty to Animals will not have to interfere on the other side. The judges were Professor Simonds, V.S., Mr. Iggulden, butcher, and Mr. Arnold, surgical instrument-maker.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

Just as people had made up their minds to the endurance of a hard and protracted winter, from the early and severe visit of the frost, it began to break, and has finally given way to very mild and damp weather. The season of cold being unaccompanied with much wet, we do not find much damage has ensued to vegetation, whilst the frost has tilled the soil enough to enable those who were backward to complete their wheat sowings before the close of the year, and so become prepared for an early spring, should we be so favoured. In Germany and northern countries there has been a heavy fall of snow, which it is hoped will be a lasting security for the young plants, but this excessive mildness makes it doubtful; while the American canals leading from the lakes, &c., are not likely to be completely open till May, and the million and a-half bushels, now on board, must remain frost-bound till then. But we apprehend that neither at New York nor in London will they be wanted before this period has been reached. The deficiency in France, which has been the principal cause of the present rates, has hitherto been balanced by the over-loaded state of our granaries and continued heavy foreign supplies, and though much loss has been sustained by the fire at Rotherhithe (say 40,000 qrs. wheat), it has had no perceptible influence upon prices, which have very little varied through the month, as seen by reference to the averages, though the markets generally closed heavily, as they usually do near Christmas. The peculiar characteristic of the weather since Michaelmas has been its prevailing fogs, which have been seriously detrimental to the interests of farmers in lowering the condition of samples as soon as thrashed. Throughout the Continent prices for the last month have very little changed. Even in France, to which country all eyes have been turned, the good supplies, want of money, and dulness of business have contributed rather to lower rates, but in the confidence that spring will advance them. Germany has kept dear, and also Russia; while in Hungary, a poor crop, bad roads, and a home demand has enhanced rates beyond an export value. Spain has been partially supplying France with her fine qualities, but has herself been importing low Russian sorts at Barcelona; and in Italy, the crops have been poor and prices high. The winter, however, will be a time to collect stores in Russia, where there has been an extended growth of wheat. So should exports hence to France increase, we shall want a replenishment, and much must yet depend on our future weather as to whether spring will bring higher rates, though there is little prospect of any serious reduction.

The following quotations were lately quoted at the places named: White native wheat at Paris 65s., Chilian 65s. 6d., red Richelle 63s., Northern, 61s.; Danish wheat at Brussels 63s. 6d., at Antwerp 64s.; red native at Louvain, 64s. 6d.; fine white Zealand at Rotterdam, 63s.; Polish at Amsterdam, 65s.; finest red at Hambro', 61s.; wheat at Zurich (Switzerland), 66s.; Danish for spring shipment at Copenhagen, 60s. 6d., cost, freight, and insurance; wheat at Cologne, 62s. free on board; the best new high mixed at Danzig, 65s., cost, freight, and insurance; Königsberg, 63s., cost, freight, and insurance; Berdianski wheat at Genoa, 62s.; fine red at Pesth, 57s.; Spanish white at Arealo, 54s.; Barletta at Naples, 57s. 6d.; soft at Algiers, 63s.; white

at San Francisco, 65s. 6d., cost, freight, and insurance; white at Montreal, 62s., cost, freight, and insurance; red spring at New York 51s. free on board, winter red 52s. free on board.

On 27th November, which reckons as the first Monday of the present four weeks' review, there was a moderate supply of English wheat, and a very heavy arrival of foreign. The morning's show from Kent and Essex was limited. But with a milder state of the weather, which rather influences qualities, sales were difficult at the previous rates. The large arrivals of foreign were against its ready placement, and with granary room scarce, some holders were willing to sell cargoes ex ship on rather easier terms; but not many buyers were found even at some decline. Cargoes afloat were also less in request, and none but the finest could be placed on former terms. The country advises this week, though dull, were not generally lower, though a few markets accepted 1s. less, as Alford, Stockton, and Gloucester. Liverpool was cheaper on Tuesday 1d. to 2d. per cental, and a like reduction took place on Friday. Glasgow gave way 3d. to 6d. per qr., and Edinburgh was down 6d. to 1s. Though Irish wheat at Dublin was no cheaper, rather less money was accepted for foreign.

On the second Monday there was about the usual quantity of home-grown wheat, and a large supply of foreign, though much less than in the previous week. The morning's show from the near counties was small and the condition somewhat improved, but there was no facility in selling, though factors asked nothing beyond the previous rates. In foreign qualities there was a better trade, with an occasional improvement on the lowest bids, ex ship, made on the previous Monday, more especially for red American and Russian sorts. Business in floating cargoes was limited, without quotable change in values. This week was a quiet one in the country as regarded business, with rather more confidence, the samples exhibited being in a better state. This enabled a few places to realize some advance, Sheffield, Melton Mowbray, and a few other towns being 1s. per qr. dearer; but St. Ives was dull, at a decline of 1s. to 2s. Liverpool was firm through the week, but not active. The Scotch markets were very steady, neither Glasgow nor Edinburgh noting any change. Irish wheat at Dublin was firm, but foreign scarcely so dear.

On the third Monday the English supplies kept to an average; but the foreign, though quite equal to the demand, fell off to one-half the previous arrival. But few fresh samples during the morning were exhibited on the Kentish and Essex stands; yet factors still found trade very slow at previous prices, millers being well in stock from foreign sorts. In foreign parcels the town demand was limited, and the country attendance being small, very little was done; but the confidence of holders prevented them offering samples at any decline. Cargoes afloat with difficulty sold at previous rates. As in town so in the country this week: though business was limited prices were much the same, yet the growing belief in a milder winter influenced some places sufficiently to cause a reduction of 1s. per qr., but not many were cheaper. Liverpool was without change on Tuesday, but on Friday there was a dull trade at 1d. per cental

A moderate supply of cheese in market to-day. Demand still quiet, and confined to the medium and cheapest sorts, with last week's quotations. Cheddars, first-class 56s. to 64s., late and secondary 42s. to 52s., Dunlops, first-class 51s. to 60s., late and secondary 42s. to 52s. per cwt.

COVENT GARDEN MARKET.

LONDON, FRIDAY, Dec. 22.

The improvement we anticipated has hardly been realised; a few things have been in a little better demand, but the general tone of the market is not like the week before Christmas. We have a good supply of Pines, hothouse Grapes, and Pears. Apples of English growth continue more scarce, but our stocks have been strengthened by the arrival of Newtown Pippins, Baldwin, and others from the United States.

SOLE MANUFACTURERS OF THE

PATENT AMMONIA-FIXED PERUVIAN GUANO,

Guaranteed to be made from the finest quality of Government Peruvian Guano, as imported. Has produced equally as good results as the unfixed Peruvian Guano, and is 30s. per ton cheaper. Recommended for all crops for which Peruvian Guano is used, and is found superior to it for Potatoes, Mangold, Beet Root, &c. In districts where the rain-fall is above an average, we recommend it for Turnips. It is not only cheaper, but also much more effective than Nitrate of Soda, as Top Dressing, and its effects are more lasting, as may be seen by the after Crops.

Patent Ammoniated Phosphate. Dissolved Bones.
Superphosphate of Lime. Bone Manure for Turnips.
Blood Manure for Roots. Blood Manure for Corn.
Special Manures for Mangold, Barley, Grass, and Potatoes.

JAMES GIBBS & COMPANY have turned their attention specially to the manufacture of these Manures, which contain all the elements necessary to promote the growth of Potato and Turnip crops. The results have given universal satisfaction, and prove the Manures to be the cheapest yet sold.

The "condition" of the above is made a matter of special care. They are all sifted before delivery, to ensure their being fit for the dry or water-drill.

LONDON AND COUNTY BANKING COMPANY.

ESTABLISHED 1836.

SUBSCRIBED CAPITAL...£2,500,000, in 50,000 SHARES of £50 EACH.

PAID-UP CAPITAL...£1,000,000 RESERVE FUND...£500,000.

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by other Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed Permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors, WM. MCKEWAN, General Manager.

“There are very few simple articles of food which can boast so many valuable and important dietary properties as Cocoa. While acting on the nerves as a gentle stimulant, it provides the body with some of the purest elements of nutrition, and at the same time corrects and invigorates the action of the digestive organs. These beneficial effects depend in a great measure upon the manner of its preparation, but of late years such close attention has been given to the growth and treatment of Cocoa that there is no difficulty in securing it with every useful quality fully developed. The singular success which Mr. EPPS attained by his homœopathic preparation of Cocoa has never been surpassed by any experimentalist. Medical men of all shades of opinion have agreed in recommending it as the safest and most beneficial article of diet for persons of weak constitutions.”

E P P S ' S
G R A T E F U L
(JAMES EPPS & CO., HOMŒOPATHIC CHEMISTS.)
C O M F O R T I N G
C O C C O A.

“By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. EPPS has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame.”—*Extracted from an article on Diet in the “Civil Service Gazette.”*

THE
FARMER'S MAGAZINE,

AND

MONTHLY JOURNAL

OF

THE AGRICULTURAL INTEREST.

Dedicated

TO THE

FARMERS OF THE UNITED KINGDOM.

LONDON :

PUBLISHED BY ROGERSON AND TUXFORD, 265, STRAND.

PRICE TWO SHILLINGS.

THE ROYAL FARMERS' INSURANCE COMPANY,

3, NORFOLK STREET, STRAND, LONDON, W.C.

CAPITAL.—Persons insured by this Company have the security of an extensive and wealthy proprietary as well as an ample Capital always applicable to the payment of claims without delay.

LIFE DEPARTMENT.—BONUS.—Insurers of the participating class will be entitled to four-fifths of the profits.

ASSIGNMENTS.—The Company grant Policies payable to the Registered Holders, whereby much expense and inconvenience are prevented. Stamp Duty paid by the Office.

FIRE DEPARTMENT,—

1st Class—Not Hazardous	1s. 6d. per Cent.
2nd Class—Hazardous	2s. 6d. ”
3rd Class—Doubly Hazardous	4s. 6d. ”

BUILDINGS and MERCANTILE Property of every description in Public or Private Warehouses.—Distillers, Steam Engines, Goods in Boats or Canals, Ships in Port or Harbour, &c. &c., are Insured in this Office at moderate rates.

SPECIAL RISKS.—At such rates as may be considered reasonable.

FARMING STOCK.—5s. per cent., with liberty to use a Steam Threshing Machine without extra charge. Nearly FIVE MILLIONS Insured in this Office.

SEVEN YEARS' INSURANCES may be effected on payment of Six Years' Premium only.

LIGHTNING and GAS.—Losses by Fire occasioned by Lightning, and Losses by Explosion of Gas when used for Lighting Buildings will be allowed for.

RENT.—The Loss on Rent while Buildings remain untenanted through fire may be provided against.

HAIL DEPARTMENT.—(CROPS AND GLASS.)

Policies to protect parties from Loss by the destruction of Growing Crops or Glass, by Hail, are granted on Moderate Terms.

LOSSES.—Prompt and liberal settlement.

AGENTS WANTED.

Apply to JOHN REDDISH, Esq., Secretary and Actuary.

IMPORTANT TO FLOCKMASTERS.

THOMAS BIGG, Agricultural and Veterinary
 Chemist, by Appointment to his late Royal Highness
 The Prince Consort, K.G., Leicester House, Great Dover
 Street, Borough, London, begs to call the attention of
 Farmers and Graziers to his valuable SHEEP and LAMB
 DIPPING COMPOSITION, which requires no Boiling, and
 may be used with Warm or Cold Water, for effectually
 destroying the Tick, Lice, and all other insects injurious to
 the Flock, preventing the alarming attacks of Fly and Shab,
 and cleansing and purifying the Skin, thereby greatly im-
 proving the Wool, both in quantity and quality, and highly
 contributing to the general health of the animal.

Prepared only by Thomas Bigg, Chemist, &c., at his Manu-
 factory as above, and sold as follows, although any other
 quantity may be had, if required:—

1 lb. for 20 sheep, price, jar included.....	£0	2	0
6 lb. 30 ” ” ” ”	0	3	0
8 lb. 40 ” ” ” ”	0	4	0
10 lb. 50 ” ” ” ”	0	5	0
20 lb. 100 ” ” ” (Cask and measure)	0	10	0
30 lb. 150 ” ” ” included)	0	15	0
40 lb. 200 ” ” ” ”	1	0	0
50 lb. 250 ” ” ” ”	1	3	6
60 lb. 300 ” ” ” ”	1	7	6
80 lb. 400 ” ” ” ”	1	17	6
100 lb. 500 ” ” ” ”	2	5	0

Should any Flockmaster prefer boiling the Composition, it
 will be equally effective.

MOST IMPORTANT CERTIFICATE.

From Mr. HERAPATH, the celebrated Analytical Chemist:—
 Bristol Laboratory, Old Park, January 18th, 1861.

Sir,—I have submitted your Sheep Dipping Composition to
 analysis, and find that the ingredients are well blended, and
 the mixture neutral. If it is used according to the directions
 given, I feel satisfied, that while it effectually destroys vermin,
 it will not injure the hair roots (or “yolk”) in the skin, the
 fleece, or the carcase. I think it deserves the numerous
 testimonials published. I am, Sir, yours respectfully,

WILLIAM HERAPATH, Sen., F.C.S., &c., &c.,
 Professor of Chemistry.

To Mr. Thomas Bigg
 Leicester House, Great Dover-street, Borough, London.

He would also especially call attention to his SPECIFIC,
 or LOTION, for the SCAB or SHAB, which will be found
 a certain remedy for eradicating that loathsome and ruinous
 disorder in Sheep, and which may be safely used in all
 climates, and at all seasons of the year, and to all descriptions
 of sheep, even ewes in lamb. Price FIVE SHILLINGS per
 gallon—sufficient on an average for thirty Sheep (according
 to the virulence of the disease); also in wine quart bottles,
 1s. 3d. each.

IMPORTANT TESTIMONIAL.

“Scoulton, near Bingham, Norfolk, April 16th, 1855.
 “Dear Sir,—In answer to yours of the 4th inst., which
 would have been replied to before this had I been at home, I
 have much pleasure in bearing testimony to the efficacy of
 your invaluable ‘Specific for the cure of Scab in Sheep.’ The
 600 sheep were all dressed in August last with 84 gallons of
 the ‘Non-poisonous Specific,’ that was so highly recom-
 mended at the Lincoln Show, and by their own dresser, the
 best attention being paid to the flock by my shepherd after
 dressing according to instructions left; but notwithstanding
 the Scab continued getting worse. Being determined to have
 the Scab cured if possible, I wrote to you for a supply of your
 Specific, which I received the following day; and although
 the weather was most severe in February during the dressing,
 your SPECIFIC proved itself an invaluable remedy, for in
 three weeks the Sheep were quite cured; and I am happy to
 say the young lambs are doing remarkably well at present.
 In conclusion, I believe it to be the safest and best remedy
 now in use.”

“I remain, dear Sir,

“For JOHN TINGEY, Esq.,
 “R. RENNEY.

“To Mr. Thomas Bigg.”

Flockmasters would be well to beware of such pre-
 parations as “Non-poisonous Compositions:” it is only
 necessary to appeal to their good common sense and judg-
 ment to be thoroughly convinced that no “Non-poisonous”
 article can poison or destroy insect vermin, particularly such
 as the Tick, Lice, and Scab Parasites—creatures so tenacious
 of life. Such advertised preparations must be wholly useless,
 or they are not what they are represented to be.

DIPPING APPARATUS.....£14, £5, £4, & £3.

A. S. Mearns Co.

THE FARMER'S MAGAZINE.

FEBRUARY, 1872.

PLATE I.

A SHORTHORN OX;

THE PROPERTY OF MR. JOSEPH STRATTON, OF ALTON PRIORS, WILTS; AND THE CHAMPION CUP BEAST,
AT THE SMITHFIELD CLUB SHOW, 1871.

This ox, bred by the late Mr. Richard Stratton, and calved on August 20, 1867, is by Bude Light (21342), out of April Rose by Warwick (19120), her dam March Rose, by Young Windsor (17241)—Christmas Rose, by His Highness (14708)—Salthrop Rose 4th, by Lord of the Manor (14836)—Salthrop Rose, by Waterloo (11023)—Young Mossrose, by Lottery (4280)—Mossrose by Phoenix (6290).

Bude Light, a roan bull, bred by the late Mr. Stratton, at Wall's Court, and calved November 8, 1864, was by Lamp of Lothian (16356), out of Diadem by Warwick (19120)—Lotus, by Buckingham (15700)—Cherry Ripe, by Nottingham (15014)—Buttercup, by the Red Duke (8694)—by Hero of the West (8150)—by Lottery (4280)—by Phoenix (6290).

April Rose, a roan cow, also bred by the late Mr. Stratton, at Wall's Court, was calved on April 6, 1862.

It will be seen from this pedigree that the white ox is bred in-and-in, his own dam and his sire's dam being by Warwick, a son of Nottingham, out of Matchless 4th.

Mr. Joseph Stratton writes thus on the early history of his ox: "His dam suckled him and his twin brother, only milking on three teats, without assistance from any other cow. He was weaned early in October, wintered on hay and a little meal. In the spring he went to grass, and in the following October was shut up for about three weeks, to fat for the young class, but my father changed his plans, and turned him into a yard to eat rough hay, straw, and roots, while the following spring he went out to grass again. During the succeeding winter, hay and roots were his only food; and in the summer of 1870 he went to grass with the other cattle, coming in for an hour every day to receive about 3lbs. of linseed cake. In November he was taken in, but never exceeded 7lbs. of corn cake per day, until about a month before he was
OLD SERIES.]

shown, when it was increased with some of Thorley's condiment. He was taken out for exercise about half-a-mile every alternate day, until he went to Birmingham, in November 1871, where he was first exhibited. His twin brother was sold, at two years old, to the butcher; as being slightly inferior and of the same age, we did not think it expedient to keep him on."

Immediately after leaving Birmingham we ourselves thus reported: "The walking advertisement for the Burderop herd has gone on famously since the Spring sale, as it was evident from the first he must do great things during the day. He is a particularly handsome beast, and has continued to feed very level, as in fact for his weight and size it is not often that a better balanced ox has been brought out. He is very good to meet, has a neat blood-like head, and, a great point, is better out than in his stall, so gay is his carriage and so smart his appearance. His touch is wealthy enough for that of a Hereford, or as some superfine connoisseurs might call it, rather strong but in our times this is a fault in the right direction. Moreover, the white steer is 'well-connected,' for his grandam on the sire's side, Diadem, was a gold medal cow at the Smithfield Club, and his half-sister, Village Rose, 'a very sweet lengthy heifer, with every promise of growing, into a handsome cow,' was the first prize calf at the last All-Yorkshire Meeting, where she beat the second prize calf from the Wolverhampton Royal. As is well-known his breeder, Mr. Richard Stratton, died a few months since, and the ox was entered here by one of his sons, Mr. Joseph Stratton, so that he was ineligible for the combined fed-and-bred premium. Otherwise, up to a certain point, he won everything he could easily enough, as, beyond his class, when it came to the best of all the Shorthorns, the judges had the winners in the several classes paraded just for form's sake, and then arrived at an instantaneous deci-

cision. We quite expect to see the white ox do as well in London as he did at Birmingham, if not even better."

At the Birmingham Meeting the white ox accordingly took the first prize of £20 in the all-aged class of Short-horn steers or oxen, the extra prize of £20, as the best of all the Shorthorns, and the Gold Medal, as the best ox or steer of any age or breed; being only beaten for the Innkeepers' Cup, for the best animal in any of the classes, by Mr. Bruce's black Polled heifer. At the Smithfield Club, however, as we had expected, he did "even better," taking the first prize of £30 in his class, the silver cup of

£40, as best steer or ox in any of the classes, and the Champion Plate of £100, as the best beast in the show. The white ox went on from London to Leeds, where he took the second prize of £6 in his class, to a beast placed only third in the week previous at York—on almost any showing as great a mistake as ever was made. Mr. Stratton sold his ox here to Mr. Bruce, of Burnside, Fochabers, by whom he was shown amongst the extra stock at Newcastle-on-Tyne, while he will be kept on for another round of meetings. At Islington he girthed 9 feet 5 inches, and weighed 22 cwt, 1qr, 26 lb.

PLATE II.

RIGHT AND LEFT.

Bang! bang! a bird for each barrel and each pocket—right and left. Well done! you brought down the duck as she sprung with a snap, and the mallard in capital style as he was whizzing away, bidding you adieu in a long hoarse *quack*. We had our eye on you for the last quarter of an hour, watching you stalking them along the

river—now crouching as if you had reached the good old age of four-score-and-ten—now on all fours—and now reconnoitring, covered by an old pollard, taking care to keep it in a line with yourself and the enemy—old Rescue creeping along at your heels, like a prowling cat on the bank of a brook looking out for a water-rat.

OPEN COMPETITION.

In the last number of the *Mark Lane Express* for the old year the printer placed two leading paragraphs in suggestive proximity to each other. The one went on the establishment of classified trials of implements at the meetings of the Royal Agricultural Society, and the other on the prohibition of Royal show stock from entry at local or county exhibitions. It is not so many years since that "out of doors" an almost unanimous opinion was expressed as to the bad policy or actual impracticability of continuing to offer premiums for agricultural machinery. All the great firms were strong abolitionists; the West of England, with some minor Associations, readily gave way to the movement, and the Press with one exception also went over. The exception was the *Mark Lane Express*, which although it so long stood alone, never turned from the line it had taken, as we believe that the proposal for an arrangement of triennial trials emanated with this journal. When we refer here to the elaborate reports now published year after year, on the comparative merits of prize implements, we do so by way of illustrating how fatal a mistake would have been committed had such a test been discontinued. The trial field would have lost almost all its attractions, and, as at the Autumn ploughing matches, everybody would of course have done the best work. A correspondent of *The Gardener's Chronicle* states that at the Smithfield Club cattle show, if the exhibitors of implements but cleared their expenses they would be satisfied; while in many instances it appears that the exhibition is at present a loss: "I know of one having a large space who did not receive a single order." The reason offered for any such stagnation is that an implement catalogue is no longer published, although it seems to be admitted that this catalogue never paid for

getting up, while, it is said further, that at the Smithfield show the exhibition of implements is "quite a secondary matter," and "a subject of indifference." The awkward fact that the gallery catalogue never sold would naturally go to bear this assertion out; as no question the implement exhibition is a secondary matter—because there are no trials and no premiums. If there were no prizes for stock that department would also soon become a secondary matter, the catalogue would not pay, and the Club and the Company would be losers by the business. In every walk of life we may now notice the same incentive to exertion, and the higher the character of the competition the greater the interest excited; just as the millions go to Epsom and Doncaster because they know that at these meetings they will see the best horses of the year amongst the runners.

Down in Staffordshire, however, they propose to reform all this sort of thing. The best of the year are no longer to be regarded as an attraction, but the rather to be avoided as a spoil-sport. Nothing, says Mr. Masfen, tends so much to injure a district show as suffering the Royal Society's animals to be exhibited here. In our simplicity, and as the result, as with Mr. Masfen, of some considerable experience, we should have come to a conclusion precisely the reverse of this. Can anything be more tame or unprofitable than the merely local exhibition which is limited to the district or the parish? where "Brown meets and beats Jones year after year, and neither is a bit the better for the meeting." One of the very evils of the hour is that we have already too many of these limited Companies from which the best of everything is carefully excluded, and where men are taught nothing more than to do as they have done. Whereas, the great aim of such occasions should be improvement, as that when a young exhibitor is beaten by an estab-

lished breeder he may be prompted to ask himself the reason why? Mr. Masfen goes for merit and numbers as the chief constituents of his county show. Mere numbers we regard as little or nothing, while merit we take to be everything. A large badly-filled class is a nuisance to a judge, and of little advantage to any one, even to the prize-takers; but a good animal makes his mark anywhere, and the better he is the greater the impression.

The meeting of the Royal Agricultural Society will be held this year at Cardiff, at the best but a one-sided fixture. It is thus probable that many, even of "the regular customers" may not be present, while according to the example set by the Staffordshire Society they will be denied the opportunity of seeing any of the Cardiff stock at other shows during the season. A great feature in the Yorkshire Society's meeting is that many of the Royal "cracks" here come together again, although frequently with very different results; and even at Stafford Mr. Timmis said "it was a weak piece of business to cut at men who had shown at Royal exhibitions, for there were farmers who could show successfully against winners at the Royal, where there was the worst judging that could possibly be done." In some evidence of this, we may add that a first-prize heifer at Oxford was beaten

during the same year at a midland county meeting, and that a stallion who once took a first prize at a Royal show never took a prize afterwards.

Should this example be followed elsewhere, its effect can scarcely be otherwise than prejudicial alike to the national and local exhibitions. For instance, Mr. Bradburn, of Wednesfield, will most probably have some of his good dairy cows in preparation for either Cardiff or Stafford, and he must make his choice, as must Mr. Walker with his pigs, and many a Shropshire breeder with his sheep. The inevitable result will be that one meeting or the other must suffer, or very probably both. As Cardiff is so far off some people will be content to win about home, or a really good animal will be very much above that kind of business. The Royal and the county Societies should work together, and the one act as a leader to the other; whereas the resolution of the Staffordshire Society makes their interests directly antagonistic. Of course, in the end the weaker will go to the wall; and we cannot but regard this alteration as promising to be attended with far more harm than good. The farmers who do not go much from home are those of all others who require improving, and yet we are to carefully contrive that their vision shall be limited to what is going on next door.

SHROPSHIRE CHAMBER OF AGRICULTURE.

At a meeting at Shrewsbury, Mr. R. J. More opened a discussion on The State and Means of Education for Farmers' Sons in connection with the Educational Endowment existing in the County.

Mr. MORE said, after speaking at length to the existing schools in Shropshire, and the action of the Special Commissioners, that the want felt for agricultural education has been met by means of new proprietary schools. Of these one of the most successful was probably Fraunlingham, in Suffolk, where the landowners subscribed £25,000 for a farmers' school. Other schools have been formed, in some of which the nature of the religious teaching adopted has caused criticism. But on this he would merely remark, the Commissioners treat lightly the religious difficulty, whilst the Nonconformist Conference are going to devote a day to the Endowed School Commission; but he thought there was no cause for alarm, as the Education Department had decided that no bishop or vicar should be *ex officio* on the governing body of any endowed school. Mr. More went on to refer to the Devon school, and the formation of a similar one in Norfolk; but in doing so he merely gave particulars which have long since been published. He concluded by moving "That it is desirable for those interested in the endowed schools of Shropshire to consider by what means the grammar schools of the county may be made available for the education of the middle classes before any scheme of reform is proposed by the Commissioners under the Endowed Schools Act," which was afterwards put and carried.

The Rev. C. F. FROST said, after quoting at great length from the Blue-book of the School Inquiry Commission, I think, in Shropshire a county school, in some measure, would start at a disadvantage, because so much of the educational zeal and liberality has been already bespoke in behalf of the Denstone schools. I shall leave it to others to advocate this view. Much may be said of a county school, and I will, if the meeting will bear with me a few minutes longer, state what seems to me a hopeful prospect of the Denstone school giving us what we want more fully and rapidly (both for the upper and lower middle class) than any other system. First, a word on public school systems. It is, I believe, almost universally admitted by all who have looked into the matter that there is nothing equal to a large school for educating day boys as they should be educated. Its value consists not, perhaps, so much in the book-learning they get, as in the system of the school and moral atmosphere, the public

opinion of the little world of boys, the mania that is taught, the control of temper, the nonsense that is taken out of them, and then the respect and love for the old school, and the thought of whether you bring credit or discredit on it. All this, hitherto, has not been put in the way of the middle classes of England, or rarely. I doubt whether the full benefit of all the advantages of a public school is gained under the number of 200, or upwards. It is said, that when there is some great work in a country which is a pressing want, Providence raises up some one or more men who are possessed with the conviction that that is the one thing to have and wish for. Such a man appears to be Mr. Woodard, the founder of the Sussex schools, which have now got a footing, and he is building through a local committee, at Denstone, for the benefit of the Midland Counties, a school for four hundred, for Shropshire, Staffordshire, and Derbyshire. His idea was to found a great centre in England of middle class education, at a cost of £15,000, one in the north, one in the west, and another in the south, which is already in full operation. I believe the school for one thousand boys, at 15 guineas a year, was about to be opened, or had been opened, at Ardingley. Lord Granville was president. Mr. Woodard has now begun his second course for Shropshire, Staffordshire, and Derbyshire. A magnificent school is rising at Denstone, within easy reach of us, for four hundred boys of the middle-class, at about thirty-five guineas a-year. And this will give to the middle-class all the advantages of Eton and Harrow. The schools at Denstone, and others connected with it, are not built on commercial principles, which generally fail in education, but on the highest and most philanthropic motives, like the motives of those who left our old endowments. And this is the question which has been found to enlist for the lowest remuneration the greatest zeal and the best talent. They only ask from the public liberality, site, and buildings. They are then made self-supporting on very moderate terms; and the system is so framed as to reproduce itself—to throw out offshoots wherever they are needed from the parent stem, supported by it till it is able to take root and grow for itself. It is proposed in the midland counties to vest the authority over them in a provost and twenty-four fellows, twelve of those fellows to be noblemen and gentlemen of the district in equal power with the twelve residents, eight only of the other twelve fellows to be clergy, who take a direct part in the education—the bishop of the diocese, the rector, and ordinary. Now, this plan is already

organised, and ready to our hand, so far as this—that a school for 400 boys, with magnificent buildings, is half-finished, and will be opened in a year or two, and this will probably meet the demand of Shropshire and Derbyshire for some years. Dover school only reached 120 in twelve or thirteen years—some clergy, some professional men's sons; and I think this would greatly interfere with the success of a county school. Again, it is probable that in a short time a school of 1,000 boys of the lower middle class, at eighteen guineas a-year, will be opened within reach, like the school which is already built at Ardingley for 1,000, in connection with these schools. Of the Manchester committee, Mr. Woodard, now a canon of Manchester cathedral, Lord Ripon, and eighty noblemen and gentlemen of high standing are members. I say, let us throw ourselves into this. Let the middle-class subscribe their one or two, or five guineas annually, to St. Chad's College, Denstone, as the cheapest investment they can make for the education of their children. And let the lower middle-class do likewise. In return for this small annual subscription, they will get, when they want it, on the lowest possible terms, the best education for their children in their respective walks of life. They will be brought up with the same advantages of the public school system as the children of the nobility and gentry have so long enjoyed—in noble buildings worthy of those of Oxford and Cambridge and our old educational structures, under clergymen and gentlemen of the highest requirements, working not in a commercial spirit but for love of the work. This is what I have to propose, and it has this great advantage—it is practicable. It is within your easy reach. It has already been done in the south of England. It is now being accomplished in an adjoining county for Salop, Derbyshire, and Staffordshire. It has had the approval and co-operation of the late and the present President of the Privy Council of Education. I do not think a county school would help being dwarfed under the shadow of a great institution like Denstone. But anyhow, something must be done, and that soon, if the middle-class is not to be left behind by the lower, not only in political power but in mental cultivation.

The Rev. W. B. GARNETT-BOTFIELD said: Some twenty years ago, when I first paid strict attention to the matter, I was convinced that there existed schools were being provided all over the country for the children of labourers (and I rejoiced, as you all will, that it was so), yet there was a danger that the labourer might have advantages which were out of the reach of his employer. In re-organising a school in the parish in which my pastoral duty then lay, I took this into deep consideration, and, as far as I could, with the means then in my power, I endeavoured to meet the difficulty. We shall soon have to deal with small endowments, which are not fulfilling their founders' intention. I would merely hint, in anticipation of a suggestion, that such a college as that at Cirencester would be suitable for Shropshire, and I give no opinion on this. I would merely hint that the sons of gentlemen intended for farming would get the best practical education by becoming pupils of some of those intelligent agriculturists who farm their land with the highest skill and with a large capital, and who are, in my humble opinion, the best calculated to afford the right sort of instruction to the young farmers who are to do such wonders in the future. Whilst I have a high opinion of such a college as Cirencester, yet I should like to send a boy to some practical farmer to complete his education. I believe that any boy might begin in a National School, pass on to a higher grade, and after a little practical instruction, either at home with his father, or as a pupil on a large holding, acquire a share of that practical knowledge which will enable him to be an ornament and a blessing to his country as a British farmer.

Colonel CORBETT, M.P., proposed the following resolution: "That a committee be appointed for the purpose of promoting education of farmers' sons in Shropshire, and for entering into communication with the Endowed Schools Commissioners with a view to devising a suitable scheme from existing endowments for that object."

Mr. EVAN DAVIES seconded the resolution, which was carried.

The Rev. S. J. HAWKES said: When Napoleon commenced to improve the condition of his country, he commenced not with the lowest class, but with the middle class.

Sir BALDWIN LEIGHTON concurred in what had fallen from Mr. Pigott—that they had not met to discuss that question one day too soon. He believed that the most proper course would be to form a committee to consider the question. How-

ever valuable the discussion that morning might have been, it was only preliminary, for the question was a very large, difficult, and complicated one.

At the dinner, where Lord Brownlow was in the chair,

Mr. LAYTON LOWNDES, for the magistrates, said that before long county matters would be managed by another body; and he had no doubt the magistrates would endeavour to turn them over to that body in such a way that it would be no discredit to themselves.

Sir PERCY HERBERT, M.P., in regard to the malt-tax, might say that he wished some Liberal Chancellor of the Exchequer would see his way to make some reduction in this, for if that old-fashioned mixture that they imagined to be made of malt were made of nothing but malt and hops there would be much less drunkenness than there was now. The temptation to adulterate it would be very much less if the duty were taken off malt. There had been a great cry of a free breakfast table, but he should like to see something done to give them a free dinner table.

Colonel CORBETT, M.P., said the malt tax was a subject which had had arrayed against it in St. Stephen's knights of the shire and worthy burgesses, who had gone to do it battle to the death; but he was afraid that that impertinent rascal that was continually taking their money from them still stood, was as rapacious as ever, and was in as good health as ever it was. If the Chancellor of the Exchequer would present a budget without this tax in it, he was sure the right hon. gentleman would succeed in bringing down the House, and they might at least say it was a matchless budget. With regard to local taxation, a great deal might be said, and a great deal had to be done, in order to secure justice for all. A measure had been brought forward, but it was taking the luggage out of the front of an over-loaded coach to put it behind. What they said was this—the land was over-burdened with local taxation, and it required to be more limited and defined in respect to household and landed property. That is the point which he took, and that was the point which many members justly took in the House of Commons. There was another subject to which he would allude—the question of the game laws. It was a delicate subject, but it could be dealt with by moderate men on both sides, in the same way as all measures had been dealt with by the practical minds of Englishmen. If they could divest themselves of their prejudices and animosities against anything that remained of the feudal system and that inordinate love of what was called sport, but what he called poultry slaughtering, they could, he believed, settle that question to the satisfaction of all parties concerned. He ventured last session to prepare a bill for the purpose of settling this question, but in consequence of the pressure of business it was not brought before the House. This bill, he thought, would settle the question. It was considered by the Central Chamber of Agriculture, and met with a favourable reception there. He was sure that this question only wanted fairly and honestly considering to have it settled to the satisfaction of every one. It would never be done by acrimony on the one hand or selfishness on the other. If they would follow the harmonious feeling which had characterised them at the meeting that day, and also at that dinner, they would obtain an amicable settlement of this question, which would meet with the approval of those concerned, whether landlord or tenant.

Mr. FIGGINS, M.P., said the owners of the soil are being attacked on all sides. First, there is the Land Tenure Reform Association, and the Land and Labour League, which appear to be pure and unmitigated socialism. I do not think the House of Commons would entertain a scheme for forcibly taking land from its present owners, notwithstanding that during the past three years it has dealt rather freely with property. Then we have the idea of Mr. Jenkins, the candidate for Truro. He would permit the man, who, by hard work and privations, has made a fortune and invested it in land to enjoy it during his life, but afterwards he is to have no control. His words are—"As to the disposal of property, a man when he died had no right to dispose of his property. He held the property in trust for the State and society, and it was for society and the State to dictate to him on what terms he should transmit it." Then we have Mr. Mill, who does not propose to take away the land. If I understand his scheme it is this, that when land is improved in value by the

great and general prosperity of the country, or by a railway passing through or near it, or from any other cause, the owner shall surrender it to the country, and be satisfied with its primitive value. Then the member for Merthyr propagates another idea, "That when a tenant has held land twenty years, he is entitled to share in it, and claim joint ownership." I commend this original idea to the attention of the noble lord in the chair, and the other landed proprietors at this table. But there is one feature in which all are deeply interested, landlord, tenant, and the public, and that is, that the land should render the largest possible amount of produce. It is said by some the system of tenure prevents this, and raises, in consequence, the price of corn and meat; but as there is no duty now upon the produce of other lands in Europe and America, and corn and meat are freely imported, the land-laws can have no effect in maintaining prices. The real cause of high prices is the improved condition of the people, at which we must all rejoice; at present the supply is not equal to the demand, but the extension of railways throughout the world will in time remedy this. Others attribute the difficulty to the uncertain tenure by the farmer, and call for a law which shall remedy this. I hope we shall never see the day when Parliament shall forbid sane and reasonable men entering into a contract. No doubt the 21 years' lease is the right system, and I cannot believe in the difficulty of a lease. A manufacturer who has a twenty-one years' lease, within two of its expiry, seeks a renewal, if he arranges well; if not, he has to pay for dilapidations, and I imagine these could be as well assessed in land as in buildings. But, after all, has not the British farmer the best tenure when he rents from one of the noble or ancient county families, who feel a pride in retaining their tenants? I would say, when you rent under these landlords be content, and do your best; but if you rent under a cotton lord, then have a lease, as the same talent which realised the land would seek for the largest possible profit from the investment. I must refer, as I have done on previous occasions, to the position of the labourer, a subject which is advancing in the public mind, and will ere long come to the front; and I venture to hope the farmers of England will meet the difficulty as far as is in their power, and not let revolutionary demagogues make political capital out of it. Of course, the speaker who at a public meeting proposes and carries by acclamation a resolution that wages should be raised 20 or 25 per cent. is only a visionary theorist. The wages of the agricultural labourer must be governed, as other labour is, by supply and demand. This question of supply is the point to which I desire for a few minutes to draw your attention. I believe the supply of this class of labour will diminish by its absorption into the large towns, under the nine hours' movement, and by emigration. There is a reform farmers can inaugurate; do away with perquisites, give no drink, but pay all the wages in hard cash. This would benefit the labourer and not injure the employer, and in time the labourer might lose his love of drink. Sure I am, before long, this will be made compulsory; for a Truck Bill is to be brought into the House in the ensuing session, and I believe payment in drink will be prohibited, and all wages be compulsory in cash. But, beyond this, I feel that the period is not far distant when the wages of the agriculturist, from various causes, will advance. The want of better lodgment for the labourer is a subject that has been frequently discussed, but I fear no progress can be made in this desirable object until the law of settlement is altered. The philanthropic landlord who would offer inducements to labourers to occupy neat and commodious cottages would only be laying up in store an increased poor-rate, a burden which would reduce the value of his property. This difficulty would be removed by throwing the entire maintenance of the sick, aged, and infirm poor on a general income tax upon all property—only a measure of justice. I have to congratulate the farmers upon the opening of a market by the Corporation of London for the landing and slaughtering of foreign cattle, and trust Government will have established similar markets at all ports where foreign cattle and sheep are received, so that the country may be free from the scourge which some years back so seriously affected it, and this county in particular.

The CHAIRMAN said lately there had been many important questions brought under their notice. Some of those questions had been very ably treated by their county members, and he did not know that he had very much to say upon them but

what had already been said. In the first place there was the question of the cattle disease. He believed that, next to Cheshire, this county had suffered more than any county in England, and he did hope and trust that slaughter-houses for infected foreign cattle would be erected at all the ports, and that they would have a system of quarantine. Local taxation was another important question upon which there had been much discussion, and he hoped, now that they had stated their grievances to the Government, some measure would be brought forward more satisfactory than any they had hitherto had. Another question that had been touched upon was the question of game. He firmly believed that no tenant-farmer would object to a moderate quantity of game. Every farmer would be glad, he was sure, to see his landlord shooting over his farm, and walking about his estate, enjoying himself. And he did believe that the animal that did the most damage to the farmer of all in the world was an animal that was not properly game, and that was the rabbit. That animal burrowed under the soil, and made holes all over it, and he ate the crops as it came out of the ground. It was the most ubiquitous animal in the world—they found it everywhere. He confessed that he did not care himself for a "big day's shooting"; indeed, he often regretted that he could not remember "the good old days" when a man went out with his gun and his dog for a day's sport. He hoped what he had said would not be taken amiss in a hunting county like that, for he hoped, whatever might be done in other respects, nothing would ever be done to spoil the good old sport of fox-hunting. He had a good deal of experience of the good effects of that sport, and he knew how many little difficulties were often talked over by landlord and tenant when they met in the hunting-field. He knew of no particular reason that was to be urged against a good lease; but he believed that there was no county in England that was so celebrated for a good understanding between landlord and tenant as Shropshire is. And he believed that that kindly feeling was very much increased by that Chamber, and to it therefore he most heartily wished success.

Mr. BOWEN JONES said: Perhaps uppermost amongst the barriers to an improved system of agriculture have been over-preservation of game, the system of rack-renting land, which has hitherto so generally prevailed, and the deficient, and, in some cases, shall I say degraded state of education, both amongst many of our class and also the agricultural labourers. I must give expression to the views that I earnestly feel for the necessity of some better system of holding land than that based on a six months' notice to quit. The sound of Tenant-Right is alarming to many minds, and amongst them—judging from what I can catch from the remarks of the honourable member for Shrewsbury, with whose views I generally agree—of his also, simply from non-consideration. I am in a position to appreciate, as much as any man, the value of the sentiments he expresses with regard to the feeling that should exist between landlord and tenant; but I cannot conceive why Tenant-Right should interfere with this good understanding, for it means nothing more and nothing less than security for capital invested for which a tenant has not derived a return, and could be easily settled in the form of an agreement or by arbitration if generally recognised, without the assistance of a measure in Parliament. I can't here enter into the arguments *pro* and *con*, but even in cases where owners have every desire and also possess the capability of meeting the tenant in permanent improvements (and from various causes how often is this not the case?), there is a large outlay required on most land before an adequate return ensues, and this will never be made to the extent it should without suitable and sufficient security is given. The dense population of this island demands food at a rate that we can't now anything like supply; but I believe that the resources of our soil, developed to its full capabilities, would at the present time almost fulfil the requirements; but I fear this will never happen without security being given for capital invested in the soil, the effect of which would be to increase the value of the land, and thereby prove to the advantage of the landowner; improve the position of the tenant, because he would be enabled to secure larger returns from the soil; and elevate the condition of the labourer, because the production of larger crops would require a greater amount of labour, and that of a superior character, that would necessitate good cottages being built upon the farm. And here I would observe, if Tenant-Right is conceded, it will be utterly useless to the bad farmer, and every landowner should

in justice be protected from bad tenants as much as good tenants should have an opportunity of improving their land without risk. As to the labourer, I hear the cry come up from south Shropshire, 9s. a week and a drop of cider; and I turn to my labour account for the last twelve months and find, excluding stock men from the calculation altogether, that most of my ordinary farm labourers earned about 14s. per week, and averaged under 10 hours' work per day. The rate of wages is the same around me, and no doubt my calculation is applicable to my district, and I am at a loss to understand the inequality thus shown between two districts within twenty miles of one another. Practically I know where perquisites are given they are not estimated at much; and I cannot help fearing that a fair allowance has not been made for them in the statements that have lately gone forth to the public. Now, remember, I sincerely desire to see the agricultural labourer's lot improved and his wages increased; and I know no class whose position has altered more of late years; but in return for this the farmer has a right to require a proportionate im-

provement in the character and amount of work done. It is not by a claim for a fixed rate of wages that these matters can be settled; the effect of such a course would be only to increase what already exists to too great an extent—an unequal payment according to capability—and the result would be to drag the best workmen down to a level with the worst. The improvement of the labourer, like that of the farmer, must depend much upon himself; and a fixed rate of wage, were it possible, would no more tend to elevate the working man than a system of Tenant-Right would improve the position of a bad tenant-farmer. I have not time now to more than dogmatically state that the additional demand that each labourer shall have sufficient land to keep a cow is both unfeasible and preposterous.

Mr. G. WISE urged that farmers should have a better security for the outlay of their capital than they had at present, and they might depend upon it that men would never invest their money in land, as they ought to do, until they had better security.

BOROUGHBRIDGE AGRICULTURAL SOCIETY.

AGRICULTURAL LABOUR.

At the first meeting for the year, Mr. Jacob Smith presided at the dinner.

The Rev. C. H. SALE read the following paper: The relations of labour and capital are now universally in an excited, not to say disturbed, state. There are various concurrent causes of this disturbed condition, material and moral, economical, social, and political; many of them natural and necessary, being incidental to a progressive civilization; others morbid and fraught with danger, the growth of antiquated, if not unjust, laws, the fruits of selfishness, and of ignorance of right principles; but all taken advantage of by men whose trade is agitation, and their object too often revolution. And it is to be much feared that the strikes and lock-outs in which the difficulties arising from this state of things have found a rough and irrational solution, only add evils of their own, which tend to separate more widely classes, where interests rightly viewed are identical. But it is not at present intended to investigate the very difficult question of the general relations of employers and employed, and they are mentioned only because it is necessary to bear them in mind, in so far as they even now indirectly affect agricultural labour, and may shortly do so directly. To the farmer there cannot be a more vital question than that of labour. The item of labour, under its various heads, if not equal to that of rent, is by far the heaviest in his balance-sheet, sometimes exceeding that of the bare rent. It is also, while the most optional expenditure, the most remunerative; and modern farming imposes a growing necessity for more and more skilled labourers. The questions, then, of rates and local taxation, to which farmers devote so much as yet unrewarded energy, vanish into comparative insignificance in presence of the undoubted fact that *agricultural labour is everywhere declining both in quantity and quality*. Notwithstanding the general rise of wages, in which the agricultural labourer shares, the supply is far from equal to the demand—able-bodied men are very scarce, and skillful labourers rarer still. I need not seek to prove what every farmer's experience attests. What is to be done? Can anything be done? These questions may have a better chance of satisfactory answer, if we pass in quick mind some of the causes which have conducted to bring about the present state of things. And first we must notice the gradual, but now almost complete, change in those pleasant relations between landlord and tenant, master and man, which used to attach a man to his employer and to his native place or neighbourhood. Those relations have, from whatever causes become mainly, in many cases entirely commercial. It is a question of money, a man passes from master to master, from one neighbourhood to another, with little consideration of anything beyond wages. The righteous measures which have virtually abolished the law of settlement, the facility and cheapness and familiar habits of locomotion, the spread of education, and the enlargement of men's minds and experience, the diffusion of information as to work and

prices, the very energy and enterprise of our best young men, whose migratory habits have been already formed by annual change of master and village at the hirings—all these contribute influences which carry men, and the youngest and the best, from home. Wherever there are, or are thought to be, high wages and openings for enterprise, thither there is a rush of the young, the strong, the self-reliant. No age has seen such a displacement of population, such concentration of labour in our cities and manufacturing counties, above all, such an enormous emigration. It is quite true that good men may do well at home, but it is common for men who are doing well to wish to do better; and in many rural neighbourhoods which have points of contact with manufacturing districts, or communications with settlers in foreign parts, the able-bodied men are drifting away year by year, and the youths betake themselves in increasing numbers to the higher paid labour of towns and coal or iron fields, or the adventure and certain prosperity of a settler's life. And while the dearth thus created is no longer relieved by an annual immigration of cheap Irish labour, it is to be expected that it may be somewhat intensified by the action of the new education law, which is likely to withdraw from employment many young boys, and perhaps some women, mothers of young families. What then can be done? It must be remembered that many of the causes of this state of things, so far from being evil are in themselves good—others are the inevitable incidents of a growing civilization which is reaching at last, we may thank God for it, the rural population. We cannot arrest these forces if we would, and we ought not if we could. We must simply accept the situation, and make the best of it. It is of no use to complain of the spirit and circumstances of the age, and engage in a vain struggle to oppose them. We must work along with them and see if we cannot so deal with them as to turn them to our purpose. And first of all we must avail ourselves of every possible help to be obtained from improved implements and machinery of every kind—of every possible economy of labour. We must substitute, wherever we can, horses for men and engines for horses. Science has done much for farmers, and it must be acknowledged that they have not been slow to avail themselves of its aid; and if only an economical and easily applied system of steam cultivation could be invented (and why should it not?) many of the difficulties of the labour question would be solved at once. And even as things are now, why should not farmers combine to establish steam ploughs in every neighbourhood to be used in turn by mutual arrangement? And why should not neighbours join their forces on thrashing days and other like occasion? Surely we may hope that the time is at hand when machinery may do as much in cultivation and preparation for harvest, as in reaping and thrashing. If this could be achieved the labours of the farm would be less dull, less uninviting to men of a more cultivated and versatile intelligence, who are now attached to other em-

ployments. But we shall be unable to keep the able-bodied men at home unless the farmer can offer wages in some measure equivalent to the high rates which attract them to the manufacturing districts. I think this not so impossible as it seems to be. The labourer, or his wife, is growing sufficiently intelligent to understand that a high scale of charges for everything, excepting sometimes coal, accompanies a high nominal rate of wages, and that seasons of depression and absolute want of work are not uncommon in manufacturing counties. But why should not the gains of the agricultural labourer be largely augmented without loss to the farmer, but rather to his gain, by a change in the principle of payment? Weekly wages, at very much the same rate to all, is now the basis of payment. It is a bad rule—it reduces all skilful and unskilful, idle or energetic, steady or immoral, to the same level. Might not the farmer adopt the principle of paying, as far as possible, according to the quantity and quality of work done? Might not piece-work, or work by take, or bargain, be the rule? This change seems to be feasible, if steam cultivation can be introduced, and would tend greatly to add to the earnings of the labourer and to his satisfaction in his work. But all would be in vain so long as the dwellings and home life of the labourer are so miserable as they are too commonly suffered to be. There are too many villages in which the condition of a considerable number of cottages is simply scandalous! The horses and dogs are more comfortably housed! The tenements are mere hovels, dangerous to health, and the arrangements forbid comfort, and even decency; and the rents, nevertheless, are often high. How can a respectable labourer be expected to remain in such quarters if he has any chance of getting out of them? And, moreover, such as they are, there is often an insufficient supply. We may be thankful that in these days he aged or infirm are taken care of, they do not die off quickly and leave vacant cottages. There is very often not a house to be found in which a man with any self-respect can take up his abode. Tenant-farmers should make this a matter of compact with the landlord or his agent. It is to be assumed when a man takes a farm that he has appliances for cultivating it, and labourers' cottages sufficient in number and respectability as are necessary as farm buildings. A comfortable cottage at a reasonable rent, with decent offices, including pigsty, and with a garden, need never want a worthy tenant. And lastly. Surely something might be done by the farmers themselves to render the lot of an agricultural labourer more cheerful, and to establish more friendly relations between employers and employed. At present the isolation is complete. There really exists, I am satisfied, much kindly feeling; what is wanted is to give it expression, to the benefit of both classes. And the overtures must come from the masters. At present all endeavours to elevate the condition of the labourer are mostly left to the squire or clergyman, chiefly the latter; and are sometimes viewed with suspicion. The farmer perhaps subscribes to the clothing club or school, that is all. But why should he not show a more *personal* interest in what concerns the welfare of the labourer? Why should he not be a member of the benefit society, which is so dear to the working man, and which ought to be dear to the ratepayer? Why should he not give his company to his thrifty poorer neighbours at their annual club feast? Why should there not be in every village, under the auspices of the principal inhabitants, a reading room, a lending library, even a working man's club; and some provision for the amusement of the young, such as a cricket-ground, or a singing-class, with an occasional concert or reading? I am satisfied that such attempts to establish a kindlier feeling between different classes and healthy local interests would not prove altogether fruitless. There might be some misconception at first, possibly some ingratitude, and a few failures; but are not these the inevitable conditions of ultimate success? At any rate, the present state of the supply of agricultural labour is most unsatisfactory. The prospects of its future are more alarming, and I may be excused for calling your attention to it.

Mr. G. W. APTLEYARD did not agree that labourers should have pig styes. The question of labour was now becoming one of a very serious character, seeing that the nine hours' system was now becoming generally adopted. The other day he was talking to a celebrated landlord, who seemed to think, as regarded farming operations, that it was time to consider how they could apply steam and machinery to substitute to some extent manual labour. He was of opinion that it would

be well if they could bring into general use the steam plough, and also have steam power brought to bear in other respects on a farm. It was worth considering whether prizes might not be given for the best constructed farmsteads, providing machinery for preparing food for cattle, and also distributing food for them around the farmstead. Mr. SALE had offered some very good remarks in introducing the question of agricultural labour, and he was convinced it was necessary that machinery should economise labour to a far greater extent than was the case at present.

Mr. R. M. CALDER said that, although wages were higher than formerly, yet there was not the number of good labourers that was necessary. He considered that the cottage accommodation, generally speaking, for agricultural labourers was really very bad. Now-a-days especially was it necessary that agricultural labourers should have decent dwellings with some regard to sanitary appliances, and inducements to cultivate decency and respectability, things which were far more attended to now than they were a few years ago. A good pig hung up in the house was a great assistance to a poor family, and another at the same time in the sty to be suspended from the roof in due course. He pointed out as one reason why farm labourers went to towns to work was that agricultural work was monotonous. Men plodded on from day to day all the year round, and had nothing to look to in their old age, it being ten to one that they went to the workhouse. He suggested that some sort of club or society should be established for agricultural labourers, by which they might derive benefit by paying in small sums, something like the life insurance system, so that they might secure to themselves a small annuity in their old age, a good thing to look forward to. The labour question was a most serious and difficult one, and did not seem likely soon to be solved. He urged that farmers, in the position they were now placed, should use machinery a great deal more, and endeavour to do with less manual labour.

Mr. BENNETT considered that agriculturists had worse servants and worse labourers than they had thirty years ago.

The Rev. C. H. SALE suggested the desirability of farm work, as far as possible, being done by take or bargain instead of by weekly wage.

Mr. R. M. CALDER said that drainage was done by piece-work, but the daily routine of a farm could not be so paid for. He was very much in favour of piecework, and should like everything done by contract, as the work was then cheaper and better done.

Mr. APLEYARD thought the hour work system might be adopted with advantage.

Mr. BENNETT was of opinion that much more piecework might be done than was the case at present.

Mr. T. SCOTT said that contract work was done in a superior manner generally speaking, but it was not applicable to all kinds of farm work. They were now as a rule paying their farming men quite as well as the working men in the manufacturing districts, taking everything into consideration. Farm labourers, their wives and families, were much better clothed and fed, and had more advantages than they used to have, and were fully equal to the labouring class in the manufacturing districts. Many labourers were getting no less than 18s. per week, in addition to which there was what his wife and children were able to earn, with cheap cottages, gardens, and the like. There had of late years a very great improvement taken place in the habits and social position of the agricultural labourer, who had now, instead of old dwellings to live in, new houses upon a much more commodious scale. He was an advocate for contract work on a farm as far as it could be carried out, but there was a large amount of labour on all farms which could not be let, and must be done by day. He urged the importance of cultivating between agriculturists and their servants the best possible relations and good understanding, and binding the two together in sympathy and mutual feeling. Educating and improving the minds of servants was to the advantage of both employer and employed, for they might depend upon it as a rule that the better a man was educated the better servant he would be, and he would then be able easily to manage a steam engine, and to do his general work in a more systematic and intelligent manner. He did not agree with Mr. Calder as to the monotony of farm work. If a man were kept thrashing from the 1st of January to the end of December it would no doubt be monotonous, but this was not the case, as there was variety about farm work, more

so than was associated with the labour of men in factories. He did not think with Mr. Calder that agricultural labourers were likely to go to the workhouse in their old age, as their position was now so different to what it used to be. He alluded to the fact that many agricultural labourers, after going to the manufacturing districts for work, came back again to the rural districts in a state of poverty, and were glad to resume their old employment. In the iron and lead mining districts the wages of labourers might be more than those of rural labourers, but then their outgoings were a great deal more.

Mr. FOWLER was in favour of contract work, which was better and cheaper than work done by day. Proper and suitable cottages for workpeople in country districts could be put up at from £90 to £100 each, and pay reasonable interest for the money laid out.

The Rev. R. D. OWEN thought that £90 or £100 was rather a high estimate, as the interest upon building was not less than six per cent., and therefore the rent of a labourer's cottage must be at least £6 per annum. He thought that comfortable cottages could be erected for less than £100 each, and pay a fair amount of interest for the capital invested. He was against women working in the fields, considering that they ought to be keepers at home, whereby they would be able to have their houses clean and comfortable for their husbands on coming home from work, tired and jaded. The farm labourer

was then more likely to remain at home in preference to going to the public-house. He approved of provident societies as a help to labouring men, good cottages for them to dwell in, with small gardens attached, and accommodation to keep a pig.

The CHAIRMAN was in favour of steam cultivation, and he believed it was adopted for that neighbourhood, and they might take shares in the North and East Ridings Steam Cultivation Company. The question of steam cultivation was one that must be practically discussed and taken really in hand at no distant time. He considered that the condition of the farm labourer at 18s. per week was better than that of the town labourer, as he breathed a purer air and had not so much to pay in doctor's bills. For the sake of a shilling or two per week more wages men were led away to towns, but he believed they would find in the end that it would have been better for them if they had remained in the rural districts. He was in favour of agricultural labourers having pigs.

Mr. CALDER said that 15s. per week for a man at Myton was better than 22s. per week at Middlesboro'. Men came back again from that town to Myton. An institute, reading room, and library had been established, and young men spent their evenings in the reading room in preference to going to the public-house. Since he went to Myton the labourers on the estate had much improved in intelligence and educational knowledge.

EWE FLOCKS ON HEAVY LAND.

At the last meeting the subject for discussion was Management of an Ewe Flock upon Heavy Land, introduced by Mr. Edward Lingwood, of Brockford. The chair was taken by J. H. Heigham.

Mr. LINGWOOD read the following paper: Within forty years an idea prevailed that sheep could not be wintered upon heavy land because the rot would destroy them. Thorough drainage, and the extended cultivation and great variety of green crops, together with the conviction that the farmer must have something to fall back upon besides his corn, have quite altered the aspect of affairs; it must be borne in mind that no amount of care and management will entirely compensate for the loss of a naturally dry soil—the true home of an animal. Those of us, therefore, who cultivate stiff land must make the best use we can of our positions. The first thing to be considered in setting a flock is, it need hardly be said, the choice of breed; but this part of the subject I don't propose to enter into now. Mr. Sexton will probably tell you there is nothing like the Cotswolds; Mr. Boby goes for Southdowns, and Mr. Green for "Suffolks," though I don't suppose the last-named gentleman would go so far as to say his was the identical breed that Noah took into the ark. However, the selection being made the food supply will next demand our attention. We occasionally see ewes sold early in the spring because their owner had no more roots for them, at the same money they were worth the previous Michaelmas. To obviate this I begin to prepare in April for the following season by sowing a large bed with drumhead cabbage seed, the plants from which are put out on heavily-manured ridges some time in June, about 2,000 to the acre, reckoning a quarter of an acre to every score ewes. As soon as the wheat is ready for hoeing I select a piece on which I sow broadcast two bushels an acre of Italian ryegrass and horsehoel it in, calculating to have something like two acres for the before-mentioned number of sheep. Early in June a few swedes are sown, as I have a particular objection to giving sucklers ryegrass in cold weather. In July turnips are drilled after the ryegrass, one-third to one-half of which are drawn off in November, part of these are set close together with their tops on and the remainder are topped, laid in rows, and covered thickly with straw; some clove seed is also sown after the tares that have been mown for the horses. Soon after clipping, the lambs having gone, I discard the broken mouths, bad mothers, and any individuals that have got badly through lambing, as my experience is that but few of the latter will breed again, replacing them with some good-sized shearlings that have not previously had lambs.

I say good-sized on account of less risk, and hogget mothers rarely wear well. The rams should be well bred, not too wide across the forehead, and if of any of the white-faced breeds not over two years old. At this season (June) the leys will afford the requisite food, with perhaps a change to a piece of mustard, and an occasional run on a pasture; but I strongly disapprove of eating uplands bare at any time between February and November. By the middle of July some of the leys from which clover hay has been taken will be ready for use, and after that the stubbles till about the 21st of September, when high feeding, if you wish for a good fall of twins, must be resorted to. To this end the flock is changed daily, getting old and young leys, pasture, and stubbles, with a nightly fold on coleworts, some watchfulness being required that no losses occur from over-eating when first going to the latter victuals. At Michaelmas marking takes place, and there is nothing so durable for the purpose as a mixture of red lead and linseed oil. A large letter looks bad, and a smeared one worse. To cure the latter difficulty I invariably shut my sheep up beforehand till they are sufficiently hungry to prevent all tendency to rub before the paint is too dry to be removed. The rams are turned in by October 1st and are supplied with some linseed-cake and old beans every morning, which they soon learn to draw away to; afterwards the mangolds and swede tops and small roots are cleared up, the unbroken stubbles affording a little amusement, till by the third week of November a few turnips will be required. These are thrown out on the pastures daily, the animals going to fold (weather permitting), on some of the unploughed turnip or mangold land, receiving when there chaff in the proportions of one-third hay, and two-thirds barley or pea-straw in covered troughs. On no account allow frozen roots or green food the first thing in the morning, or a certain loss of lambs will be the result. Should the frost be severe and a run on some rough grass can be had, the fewer roots that are given at this time the better; and in addition to the chaff some barley, bean, cloverseed, or pea-straw put in racks or between hurdles, afford occupation if but little nutriment, always taking care that fair condition is maintained. I should prefer, however, risking a lot that were too thin to one that had got to the other extreme. Soon after the commencement of the new year I begin to eat off the turnips that were left on the land, a liberal supply of succulent food being now indispensable. Should the land be too wet, a remove must be made to the pastures; indeed, a change is desirable in either case, both on the score of exercise and as a cleanser of the wet and clogged feet, for in

the matter of foot-rot prevention is far better than cure. A few days before lambing a dry pasture near home becomes the feeding ground, on which is thrown out any turnips that may remain, with swedes and cabbages: the sleeping place a temporary yard with pens round it for the newly-lambed ewes. I need hardly say that constant watchfulness will now be necessary, but if the flock has been properly managed, has not been frightened with dogs, or allowed to break out, no very great difficulty will usually be experienced. Depend on it when you hear of great losses of sheep and lambs, there is good reason for it; not but what difficult cases may, and will occur, which cannot be practically treated on upon paper. You may read precisely how a man's leg should be taken off, and would then be just as capable of performing the operation as you were before. Wrapping up in a sheep skin is the best cure for a chilled or weakly lamb, giving it warm (not hot) milk in small quantities. This is preferable to taking it to a fire, as in that case oftener than not its mother will decline to have anything more to say to it. Sheep will eat ivy plucked fresh from a tree when they will touch nothing else. Should they refuse all food, or take it in insufficient quantities, no time should be lost in giving gruel. Many an animal dies every season that a week's hand-feeding would have saved. When turning out don't put too many young lambs together, otherwise they get knocked into ditches and drowned, or perhaps internally injured; and if you have any bad milkers it is better to feed them high (linsed cake and malt chives are as good as anything) rather than give the lambs cow's milk, which does not always agree with them. Shutting up is unnatural to animals so well provided against the vicissitudes of climate, and if persisted in is sure to result in loss of wool. A piece of old grass is mostly reserved, and here let me turn aside from my text for a moment to remark upon the utter senselessness of breaking old grass even if second rate. Drain, clean, and apply two or three dressings of farmyard manure, then see if in the average of years you are not better off with a proportion of meadow. It is not very long since I sold sound wheat at 35s. a quarter, and I should as soon expect to find a hare on the top of the monument as twitch grass in an old pasture on which the ewes are drafted, as their progeny become strong enough to take care of themselves. Here they have chaff (if the weather is cold enough to induce them to eat it), swedes, and cabbages, lying at night if the ground is dry, but not otherwise, on the land from which the cabbages have been removed. I have tried feeding them where they grew, but it resulted in so much waste that I gave up the practice. As soon as a sufficient bite of Italian ryegrass has sprung up another remove is made, roots being given as well, as long as they last, the lambs going forward through the hurdles, and eating a mixture of miller's offal and linsed cake. This looks an expensive proceeding; but it must be borne in mind less of other food will be required, and your animals will reach 25s. each much sooner than they would otherwise; besides, I prefer selling mine early. The ryegrass finished, the leys will be fit for use, which will about bring us to the point we started from. Should the breeder, however, wish to keep his lambs on after weaning, let him take especial care to put them on fresh ground; any place that has been grazed with sheep the same season will inevitably ruin them, as I once found to my cost. I have given no opinion as to the number suitable for a given extent of land, because circumstances must govern cases. A flockmaster may be his own landlord, may possess a lease, be under a yearly tenancy, or may be prejudiced in favour of some particular kind of stock. There are no doubt exceptional instances to the contrary; but in a general way, it is my humble opinion, to overstock with any one description of animal will not be found advantageous in the long run. You will now probably be looking out for the balance-sheet—the easiest thing in the world to get up—on paper. Many of you will hardly have forgotten an imposing array of figures, purporting to be a farm balance-sheet that went the round of the papers some few years since, yet its compiler refused a handsome offer to allow three practical men to test his statements. I once handed a bill back to a tradesman with the remark that, in copying it from his books, he must have turned the sixes the wrong way upwards. I shall therefore merely say, in conclusion, that losses should not exceed five per cent. per annum, and the wool and refuse ewes when fit for the butcher ought to replace the gaps. Moreover, I should not consider less than twenty-seven or twenty-

eight lambs (alive on the 1st of June) to the score a good fall. In giving you these few facts, I have endeavoured to be as concise as possible, bearing in mind the advice given by the president of one of our county clubs to an intending reader that the time taken up with an unreasonably long paper would be better devoted to a discussion of the matter under consideration. I will therefore now leave the subject in your hands.

Mr. J. J. HATTEN asked whether it was good policy to have ewes at all on a heavy land. And also what proportion Mr. Lingwood would recommend to the 100 acres.

Mr. KISTRUCK, on being called upon by the Chairman to speak on the subject under discussion, said he left the management of his flock chiefly to his man, and he would advise flockmasters to get a good man and pay him well. Some people were disposed to condemn the practice of using mangold. His shepherd was of the same opinion, and always condemned them. Last year, however, he (Mr. Kistruck) had no turnips, and he was obliged to fall back on beet, and he must say that he never had such a fall of lambs in his life. He had nearly a lamb and three-quarters to every sheep, and this fact rather induced his shepherd to think more favourably of the use of beet.

Mr. JAMES MATTHEW said he should like to know why Mr. Lingwood preferred a shearing that had not had a lamb. For his (Mr. Matthew's) own part, he preferred a shearing that had had a lamb, inasmuch as you had then the opportunity of seeing what the animal really was, whether or not it was a good-framed sheep, whereas a shearing that had not had a lamb was filled up with flesh, and there were probably many defects hidden. And besides it was generally expected that a sheep would have a better time with the second lamb. There was one point in regard to which he must differ with Mr. Lingwood, and that was as to there not being twitch in old pasture. If Mr. Lingwood would go into Harleston, and many other places in this neighbourhood, he would find lots of twitch in old pastures—in fact, there were very few without it.

Mr. NOBLE said the gentleman who asked whether it was right to keep a ewe flock on heavy land at all struck the right note. That was after all the important question, and one that he hoped would receive an answer. With reference to another point that had been raised, he must say that his experience led him to prefer a maiden shearing. The question was whether the sheep could be got up for the tup at all. There might be a little more risk with the maiden shearing; but once the shearing had lambled down, he thought the sheep would stand much longer.

Mr. W. WILSON, in responding to the call of the Chairman, observed that he once lambled down eight score ewes, and he did not lose a single ewe, and when there were no turnips, they had nothing but beetroot and straw. He did not agree with what Mr. Matthew had said about the shearing hogget. He (Mr. Wilson) thought it was the worst thing anybody could do to buy a hogget that had had a lamb. The maiden shearing was decidedly preferable, for it was stronger and better, and likely to pay more in the long run of years.

Mr. J. TURNER asked whether the sheep were fed in the yard.

Mr. WILSON said they were, adding in reply to another question that he threw the beet down in the yard. He never had such luck before. They had no corn; but they had all the straw they liked.

Mr. J. MATTHEW said some persons could evidently keep sheep cheaper than he could. He could do nothing with sheep fed on mangold. He remembered that one spring he was badly off for turnips, and he threw beet on to the pastures where the sheep had lambs, and after they had had beet about a fortnight, the lambs began to die. He discontinued the beet, and turned the sheep on to small rye, and he did not lose any more lambs after that. He could not of course attribute his loss to anything but the use of the beet.

Mr. J. TURNER: That was after your ewes had lambled?

Mr. MATTHEW: Yes.

Mr. WILSON: Was the beet grown by artificial manure?

Mr. MATTHEW: No, with farmyard manure.

Mr. WILSON said he was once very unfortunate in feeding sheep on beet grown by artificial manure.

Mr. JOHN TURNER said he quite agreed with what Mr. Lingwood had said relative to making ample provision for

lamb in the spring. He (Mr. Turner) rather thought more reference would have been made to the yarding of sheep. His plan was to keep his sheep in the yard. He began to put them into the yard about Christmas time, and he kept them there constantly, occasionally walking them out. He littered the yard night and morning, and raked them up with bean-straw, pea-straw, or with whatever he happened to have at the time. He generally put about a third of wheat-straw to a third of hay, and allowed the sheep to run on a meadow an hour or two in the day, and he never found anything wrong with his sheep so treated. His man was particular in looking after them, and if he found any that limped at all they were tended to at once. He quite agreed with the use of beet for sheep. If a beginning was made with beet care must be taken to keep on with it. If the sheep were not fed with beet before they lambed they must not have any directly after. About six weeks before the sheep lambed down it was his custom to give them a certain quantity of beet, and he increased the quantity as they grew nearer to lambing time, and when they had lambed down he gave them beet on the pastures. With regard to the propriety of keeping breeding sheep on heavy land, he might say that he concurred in it if they were treated in the manner in which he had been accustomed to treat them. He generally pulled a certain quantity of turnips off, and he placed the tops and tailings on one side, and gave the sheep a few occasionally. He left a piece of turnips to turn the ewes on shortly before they lambed, but he took care to get them into the yard again before they lambed. He occasionally gave them cut chaff, malt coombs, and if he found anything going wrong he gave them something else. He thought new milk was preferable to gruel—in fact, he never boiled any gruel for his sheep. He perhaps sometimes gave them some of the old-fashioned medicine, a little old beer sop, which they sucked down, and it was no doubt useful when they were unwell. He also found that they did well on a little oileake mixed up. Mr. Turner added, in answer to Mr. Matthew, that he had no objection to a shearing if she had had a lamb—in fact, he rather preferred a shearing that had had a lamb to one that had not.

Mr. WOODWARD: If you tip a shearing that has had a lamb the lamb must have been off early.

Mr. HEWITT inquired which was the best breed of ewe for heavy land.

Mr. J. TURNER said he generally kept the blackfaced ewes topped with the Leicester top.

Mr. FARROW: When do you top them?

Mr. TURNER said about a fortnight after Michaelmas, adding that formerly he could not get his feed early enough on the heavy land, but now he had a good quantity of feed when he wanted it, and instead of eight or nine score, he kept twelve score sheep.

Mr. ADAMS (shepherd to Mr. L. Webb) remarked that his practice was to put the sheep into the yard. He gave them mangold mixed with chaff, allowing the mixture first to lay a few hours. He also gave them bran, and he found that his sheep kept their plight very well. Some of them had, however, turned up lame.

Mr. TURNER: Do you attribute the lameness to the fact that the sheep were in the yard?

Mr. ADAMS: When in the yard they flung out a fever which, I think, went into their feet.

Mr. TURNER: What breed of sheep had you?

Mr. ADAMS said Hampshire Downs. There were a few half-bred in the yard, and none of them turned up lame. He must say that he never saw lambs do so well as when the sheep were fed with mangold thrown out on to the pasture.

Mr. HATTEN observed that it was the peculiarity of the Hampshire Downs to turn up in the way referred to. They were not to be depended upon, and he for one should not condemn the practice of keeping sheep in the yard because a quantity of what might be called fancy ewes had fallen down with the disease. He would guard flockmasters against the use of beetroot alone. He once had some ewes which had beetroot, and beetroot to it (laughter), and the lambs were fine and healthy, but soon after taking the mother's milk they fell away and died. He had known this to be repeatedly the case, but when ewes had grass with the beet they did well.

Mr. ADAMS, in reply to a question, said he preferred giving the beet in troughs. The roots went further, and besides, if

the mangold were thrown about the meadows the sheep were likely to knock themselves about after them.

Mr. TURNER, in answer to Mr. Thomas Lingwood, said if the ewe was poor, and she had got lambs, he sometimes gave a little cake.

Mr. THOMAS WOODWARD expressed his opinion that it was desirable to keep ewes on heavy land, especially at the present prices of lambs and mutton, but he was not inclined to think that it was desirable for a man to keep all ewes on heavy land. It was much better to keep a certain quantity of ewes and grazing sheep as well. He had tupped a few hoggets, and sold them out as couples, and been pretty successful. He had now taken to shearlings and two-shear. His system was to provide liberally for the ewes, similar to the plan adopted by Mr. Lingwood. He (Mr. Woodward) questioned whether they ought not to keep a flock of ewes more economically than was frequently done by growing roots on heavy land. The great point to arrive at was how to keep the ewes at a cheap rate. He thought that after the ewes had been tupped, and the tup taken away, they might be kept eight or ten weeks at little cost, and he considered the system of keeping them in the yard with dry food the right one, but previously, and after they had lambed, he liked to be liberal with his keep. He had the lambs which he bred, and his practice was to have half the white turnips pulled up and heaped, and he went to the expense of cutting for his hoggets about half what they required; they would pick up the rest, and the ewes followed after. His ewes had no corn or cake, but they had all the straw they could eat, and when the straw was good they required but little hay. Ewes were great consumers, and unless care was taken they would soon run away with the feed. He had four hundred acres of land, and he kept about twenty score sheep. He had about seventy-five acres of pasture. If a man wanted to get his lambs up quickly he must feed them liberally. He had had them so that they paid 25s. each in May.

Mr. FARROW said he understood Mr. Wilson to say that beetroot grown with artificial manure was not good for sheep.

Mr. WILSON: For breeding ewes.

Mr. FARROW said he remembered that at the first discussion in connection with this club artificial manure was strongly recommended for mangold.

Mr. HATTEN said he believed sixty ewes to the hundred acres a proper number in addition to other stock.

Mr. WOODWARD remarked that he had a dairy of eight cows in addition to other young stock growing up.

Mr. M. MUMFORD observed that when the seasons were favourable he, like his neighbours, could make good plans, but the difficulty was to know how to manage in dry seasons to keep the sheep from going back. Mr. Mumford then spoke of stock keeping in connection with the length of tenure, and he expressed his opinion that the tenants did not get the length of tenure they had a right in fairness to expect, in order to give them the opportunities of effecting improvements. Many a tenant reasoned thus: "My landlord is a good fellow, and will not put me out." But money was a great temptation with the rich, as well as with the poor, and if another person offered a higher rent, in consequence of the improvement which had taken place in the land, it was a great temptation. He once did some good draining, when his neighbour said, "Won't you be cured the first dressing?" That land had been drained many years, and it did well; but he never did any more. When he did this he felt that he was a tenant for life; but afterwards, when he felt that he was not, he held hard (laughter). It reminded him of the fox and the grapes. The fox liked the look of the grapes, and jumped highly to get them. Had he felt that he was a tenant for life he should have had another jump, but he felt that he was not, and that it was wrong for him to go to this expense.

The discussion then turned upon the treatment of the ewe at the time of lambing, Mr. Thos. Lingwood expressing an opinion that there were many lambs lost through the ignorance of the person in attendance at the time of lambing; and Mr. Sutton remarked that the great error made was in being in too great a hurry.

The CHAIRMAN said he would ask Mr. Edward Lingwood what sheep were the best for heavy lands. He (Mr. Heigham) farmed some heavy land, and he only wished that

years ago he could have heard a discussion similar to that which had taken place that night, and then he should not have been the loser by sheep he had been.

Mr. EDWARD LINGWOOD then replied, and he said he believed the blackfaced Suffolks stood the land as well as any. Half-breeds, if there was a desire to sell early, did exceedingly well. Mr. Lingwood then referred to the various points that had been advanced during the discussion, and with regard to the system of yarding, he said he had tried it to some extent, but he found that the feet of the sheep became tender. He questioned whether a great deal of harm was not often done in turning ewes up to attend to their feet. He would rather

not have the foot-rot in his sheep, and, in consequence, he put them upon the land where they were not likely to get it. As to giving sheep mangolds, he approved of much of what had been said that they must be given to the ewes some time before they lambed.

Mr. PETTIWARD proposed a vote of thanks to Mr. Lingwood for his paper, remarking that the Club were now indebted to Mr. Lingwood for having introduced two subjects of great importance, the previous one being that of farming on the flat or heavy land.

The resolution was carried, and a vote of thanks to the Chairman closed the proceedings.

BRAMPTON FARMERS' CLUB.

THE GAME LAWS.

At the January meeting, Mr. George Coulthard, of Lancer-cott, in the chair, the following letters were read:—

Amphill Park, Amphill, Dec. 27, 1871.

Dear Sir,—I beg leave to acknowledge your letter of the 23rd inst., which I have this day received, asking me to write to you a few lines on the subject of local taxation, that you may lay them before the Brampton Farmers' Club at their next meeting. I have not their resolution before me; but, from my recollection of it, I believe I fully agree with it. I certainly wish many things that are now exempt from rating to be made liable to it—as I particularly mentioned at Carlisle—woods, minerals, and game. I believe that tenants have a much stronger feeling against game, when it is sold by the landlord; but I am disposed to agree with some remarks made by Mr. Bell—that if shooting is retained by the landlord—not for the sale of game, but for his amusement, or that he may make presents to his friends—he should also pay. I do not know if there will be much practical difficulty in dealing with the matter; I suppose when game is not preserved by owner or occupier, that land will not be liable to a game-rate. It should be the object of all taxation, including rating, not to press unduly upon any class, but to make it fall as equally as possible on all. There are at present irregularities which should be removed—omissions which should be filled up. I look, too, on the system of collection as hard upon the yearly tenant. I believe the Scotch system would remedy some of these evils, as, I think, a local board would be useful in calling attention to them, and in correcting them. I am glad to see that the Government intend to bring in this Session a bill on this difficult business. I hope it will be satisfactory and fair to all. Great good would, in my opinion, issue from a measure that would make the sales of land more cheap than they are.—I have the honour to be, your obedient servant,
C. HOWARD.

South Acomb, Stocksfield-on-Tyne, Dec. 28, 1871.

Dear Sir,—Your letter with resolution of Brampton Farmers' Club on local taxation has been forwarded to me by Mr. M. Stephenson, who is secretary to the Tyneside Agricultural Society, but not secretary of Hexham Farmers' Club. I shall lay your letter and resolution of your club before the committee of the Hexham Club, and shall let you know the result. It would be an advantage if there was, as you say, "a closer union of the several clubs of the district." I may mention that our club has had, on numerous occasions, before it the subject of local taxation, and twice, I believe, sent up petitions. I cannot, for my part, see any justice of relieving land of the taxation it now bears—the only result would be an increase in rent. Of course, we agree to taxing woodlands and minerals; but I decidedly object to taxing game—game is not property. The game question is being well agitated, and I believe there is only one thing for it, and that is—total repeal of the Game Laws. As a piece of class legislation, these laws are decidedly wrong. The Hexham Club goes in for landlords paying one-half of all taxes, as is the case in Scotland. By paying one-half, new taxes don't tell so heavy on the tenant, and, moreover, roads require great improvement, and vast sums expended on them—it is not equitable that the whole of the cost should come on the tenant. Good roads in-

crease the value of adjoining property; hence, the benefit to the landlords. And landlords, when they pay one-half, may fairly be allowed to take an interest in the roads, &c.—I am, yours, &c.,
WM. TROTTER.

The Rev. W. Dacre then read the following paper:—

In the few remarks I shall make on the subject of game preservation and the Game Laws, I shall not enter into any inquiry as to the origin or history of the Game Laws; but shall endeavour to confine myself to such matters of a practical nature as may bear upon the interests of agriculturists, with respect mainly to the evils resulting from an over-preservation of game, and I shall endeavour to point out such remedies for these evils as present themselves to my mind, with a hope that the subject may lead to thorough discussion by those who are interested in this much-vexed question. Having been asked to read a paper on the Game Laws by the secretary of our club—I am aware that the subject might be better handled by many others, both among the keen preservers of game and the tenant-farmers of the district; but, perhaps without sufficient consideration on my part I accepted the task, and until I set to work to jot down my own views and thoughts on the subject, I was scarcely aware of the many difficult complicated interests which would be affected in order to bring about any great change in the Game Laws. I may at the outset state that I have had some little experience both of the evil effects produced by the over-preservation of game, and also of the supposed material benefit arising from its strict preservation, and may be supposed to hold a neutral sort of position, and to state my opinion without being unduly prejudiced for or against either of the two parties who are interested in the question of the preservation of game. I trust, also, that I shall not be deemed egotistical if I state precisely what my own views relative to the preservation of game are. If the preservation of game extends only to winged game, I should probably be as zealous an advocate for the power of reservation of the right of killing game as the strictest preserver, with, however, certain restrictions; but with respect to ground game, and especially rabbits, I think no restriction whatever ought to be placed on their destruction by the occupier, but that they should be altogether withdrawn from the game-list for all purposes whatever; and that the tenant should have free liberty to keep them down by shooting or otherwise. I would here make the remark that in the Brampton division of Eskdale Ward, within the immediate area of the Brampton Farmers' Club, we see comparatively little of the evil results arising from excessive preservation of game, compared with what is experienced in many parts of the country, and even of this ward; but, nevertheless, on many a farm in this portion of East Cumberland, the injury inflicted by ground game is much greater than is generally imagined. To give an instance in point. A few years ago I let some shooting for £30 per annum on lands belonging to me, which had not been strictly preserved, and on which the tenant of the game, by word of mouth, undertook to keep down the ground game. The second year of the taking, the tenants of the farms complained to me that they were suffering great injury, especially from rabbits. I appointed a valuer to inspect the damage done, and viewed it myself also. The amount assessed as damages

came to somewhere between £90 and £100, which, in my opinion, was under rather than over the damage sustained by the farmers, to say nothing of the injury to their feelings in seeing the labour of their hands and the talent of their brains thus wasted by vermin. It may be objected that a landlord is at liberty to make whatever terms he chooses with his tenants, and that if the tenant chooses to take his land, subject to the condition that all the game is reserved to the landlord, it is no business of anyone else, and that the tenant will, of course, make his calculations accordingly. This, to a certain extent, is true; but it does not convey the whole truth. To illustrate my meaning I will take this part of the country from the Solway to Northumberland. Less than twenty years ago the principal proprietors of the district in Arthuret, Kirkcubton, Walton, Braampton, and Lanercost did not preserve strictly, although perhaps they may have reserved to themselves the power to do so. Practically speaking, the game on the greater portion of these was not strictly preserved, and the lands were let to tenants, who, knowing this, made their calculations accordingly. Since that time, however, the former proprietors have been succeeded by preservers of game, and the tenants suffer in consequence without any reduction being made in their rents. I may, however, mention that on Lord Carlisle's estates the farmers have within the last year or two been allowed to kill the rabbits on their farms. The strict preserver of game affects not only his tenants but also his neighbours injuriously in several ways. Say, for instance, that I join a preserver of the ground game, and what do I find? My hedges are riddled by the rabbits' burrows, my adjacent corn crops much damaged and destroyed (for it is not only the amount that the rabbits eat, but what they waste that is the injury), and my swede turnips almost a failure. In some cases which I could mention, the farmers find it useless to attempt to raise a crop of swedes in the vicinity of the woods where hares and rabbits are harboured. It is not, however, to his tenant or his immediate neighbour alone that the strict preserver of game does an injury, but to the community at large. I might refer to the damage done to crops, especially by ground game and which enables a less amount of valuable stock of sheep and cattle to be kept, although this might be worthy of consideration as affecting prices of butcher's meat, but I refer to other injuries. Where excessive preserving takes place, there poaching abounds. It is notorious that many of the best gamekeepers have originally been themselves noted poachers. How much, too, of the expense incurred at our various Petty and Quarter Sessions through the prosecution of poachers and their maintenance in prisons is defrayed by rates levied on the occupiers of land in the country? Added to this, the preserved land does not pay so high a rent as the land which is not preserved, or as it would do if let without reservation of game, and, consequently, does not pay its fair proportion of rates. It seems doubly hard therefore that, whereas the preservation of game increases the rates by requiring more police and great expenses to be incurred in prosecutions and maintenance of prisoners, the rates which the land so preserved should pay are being paid by the occupiers of adjoining lands, who are suffering in several ways from the preserved game. It may be asked what are the advantages of the Game Laws? Ist, they afford the owners of property a healthy exercise and manly sport, without which there would be reason to fear that, with our high state of civilisation and the numberless allurements of luxury and easy enjoyments of all kinds, our middle and upper classes would be apt to degenerate into effeminacy and unmanliness, as in the case of ancient Greece and Rome, and our national character as a hardy and athletic people would soon be lost. I admit the fact that our national sports have this good tendency, and I should be sorry to see them done away; but I do not admit, as a deduction, that therefore ground game ought to be preserved. Another presumed advantage is, that were the laws repealed game would become ere long extinct. This also I deny, and did time allow I would give my reasons in the remedy suggested by me for the present evils. I feel I have taken too long a time in dwelling at length on the evils I have described; but I trust I shall be pardoned if I detain you a few minutes longer in describing what appears to me to be the remedy for those evils. In the first place, I would say abolish the Game Laws as they now exist, and make the laws for trespass even more stringent than they are at present. 2nd. Let the landlord when letting his lands on lease or otherwise to his tenant

give the tenant free liberty to destroy all hares and rabbits if he chooses, and at the same time let him make a reservation to himself of the winged game. I have known this done by a large landowner in Worcestershire, who keeps no gamekeeper or wateher, but simply has an understanding with his tenants that he expects to find a good supply of game when he goes to shoot, and I believe he has never yet been disappointed. He finds the benefit to himself by a thoroughly good feeling existing between himself and his tenants; by a great saving of expense in not having, as formerly, to keep up a large staff of gamekeepers and watchers; and his lands are let to the best advantage. The goodwill alone which would thus be increased between landlord and tenant, and which is beyond any money value, would of itself be worth the whole of the imaginary sacrifice made by the landlord. 3rd. Do away with all perquisites to gamekeepers in the way of allowing them to have the rabbits on the farms. A great show of zeal is shown by this class of men in putting down large numbers of rabbits in the autumn, when fattened on the farmer's crops and stubbles; but in the spring time of the year, when the rabbits are breeding most numerously, the keepers will refuse to allow them to be shot, for fear of disturbing the pheasants and other game that are also breeding. But in many cases they have an eye to securing a good crop of rabbits for themselves in the coming harvest. 4th. If sportsmen desire to have a large supply of game, let them take a portion of the arable land into their own hands, and endeavour to grow good crops of corn and turnips on it, and an unlimited amount of game. They will soon learn by experience something of the farmer's feelings, who is expected to make up his annual rent, and at the same time to allow his crops to be decimated by a devouring army over whose numbers he has no control. I may state that in the neighbourhood of Penrith this is done by a large landowner. And, lastly, let no landlord let or give his shooting away to any one who has no interest but to keep up as large an amount of game as he can upon the land. Such a tenant of the game, as I have learnt by experience, has a directly opposite interest to the tenant of the land. His only object too generally is to secure his own selfish objects, being utterly indifferent to the interests of the cultivator of the soil. I would make one remark with regard to the gun-tax. This tax was originally brought forward to prevent Fenians and other desperate characters from carrying fire-arms. But it is not to be supposed that such men would ever on the one hand apply for a licence for their murderous weapons, nor on the other that they would be deterred thereby from carrying such weapons. It would be an interesting inquiry to make as to how many revolvers belonging to men of this class have paid the licence duty. But the effect of the gun-tax has been made to impose an extra tax on the agriculturist, as if he had not burdens enough without, and to make him act involuntarily as a wateher to keep up the hares and rabbits on his farm. Why should I have to pay 10s. a year for a gun licence and 2s. 6d. for a hare licence to keep rabbits and such vermin from destroying my crops? In conclusion, it is requisite that farmers should combine to state their grievances and have them remedied. For landlords to require the full rent for the lands, and to eat their growing crops without rendering any compensation, seems like the ease of a nation of old requiring a conquered people to make bricks when the chief material for the purpose was removed. The motto of landlord and tenant should be "Live and let live." The tenant would like to see his landlord come and enjoy good sport, whether it be in the hunting field or with the dog and gun. He only desires that consideration should be given to his feelings, his interests, and his rights, and that what is sport to his landlord should not be ruin to himself.

Mr. ROUTLEDGE mentioned that the late Sir James Graham had allowed his tenants to shoot the ground game, and having asked them to protect the birds, they had done so, much to his satisfaction.

Mr. R. GRAHAM, the Secretary, mentioned an estate, "not a hundred miles from that neighbourhood," where there were battues now and then, and in three days over three thousand head of rabbits were destroyed. On another farm there had been within a dozen of six hundred killed. And such was the licence within which these battues were conducted, that even the house in which the farmer resided bears marks of the shot that came from the guns on that occasion, and the glass in his windows was riddled. What nobleman or gentleman

would like to be so invaded in his castle or mansion? He believed that the taxes were increased in various ways through the preservation of game, and he would move this resolution: "That this club fully endorses the opinion that flying game alone should be preserved, and that all other ground game should be considered vermin, and treated as such."

Mr. FRASER complimented Mr. Dacre on his paper, which entirely enunciated his own opinion regarding the obnoxious game laws. Mr. Dacre was perfectly justified in saying that the Game laws were both demoralising and degrading to the people of this country. They were entirely the class legislation of the landed proprietors against the tenant farmers; and he was fully of opinion that if the latter would only make a decided stand as they had done in Scotland, more especially with reference to the ground game, over-preservation would soon be a thing of the past. He referred to his own paper read before the Penrith Farmer's Club, and said that afterwards he had had letters from all parts of the country giving him statistics and facts, and offering him assistance in a quiet and unostentatious manner because a big man was up in arms against him. This was a question he felt very much upon, and the tenant farmers would become more alive to the vital nature of the subject. They would then combine together, and before they sent a representative to Parliament, would ask the test question whether or not he would support a bill to repeal the Game laws, *in toto*. Mr. Dacre had been very moderate in his ideas, and had not gone so far as he would have done, for he went in for the total repeal of the Game laws. If a more stringent law of trespass were placed in lieu of these laws, it would have a much more beneficial effect. Mr. Dacre had spoken from two points of view. He was a landed proprietor, and consequently, to a certain extent, he must have the views and interests of a landed proprietor at heart. On the other hand, he was an enthusiastic farmer, and any man who had effected so many improvements in his property as Mr. Dacre had done, would be greatly grieved to have his crops of swede turnips and other crops destroyed by hares and rabbits and such vermin. The opinions expressed by Mr. Dacre came very well, indeed, as they came unbiassed, and not from one point of view, as his own had done. If the necessity of the repeal of these laws were pressed on every county member we should soon, he hoped, have it effected.

Mr. DACRE expressed his approval of the abolition of the Game laws, and making the law of trespass more stringent. He liked to see game, hares and rabbits on his land, but he would not like to see them beyond control. When one man lets a farm to another and reserved to himself to keep as many hares and rabbits on it as he chose, it was just as sensible as

another man trying to let a shop to a grocer, but, being fond of rat-hunting, stipulated that he should keep an unlimited number of rats in it. The only difference would be that the grocer was not such a fool as to take the shop on such terms, but the farmer was too dependent. He referred to the frequent loss of life in poaching encounters, and said the whole of the game in the country was not worth one man's life. This immoral tendency alone ought to be a strong inducement to give up a law which had such iniquitous results. There was another point which he ought to have mentioned. There were large quantities of land in this country unreclaimed, and owing to the lords of the manor having right to shoot over these, which right they would lose if the land were reclaimed, the Game laws acted as a great barrier to the cultivation of land. If a tenant had full liberty to kill rabbits and hares, the rest of the game is that which, in his opinion, does him more good than harm; therefore he would go in heartily for anything that would encourage their preservation. He believed that the repeal of the Game laws, and the passing of a more stringent law of trespass, would meet the tenants' view, and those of the landlord too, if it were understood that the winged game might be reserved. The difficulty in getting such a law was increased by the fact that most of our legislators were game preservers themselves. He proposed the following resolution: "That a memorial be forwarded to the members for East Cumberland, to be laid before Parliament, praying for a repeal of the present Game laws, and to make the law of trespass more stringent." Before sitting down, Mr. Dacre claimed his "call," and suggested that a paper should be read on the inequality of the rates and the income and other taxes. There were certain injustices done under the income-tax, and they had suffered very much in this district from the house-duty tax.

Mr. GRAHAM withdrew his resolution in favour of that of Mr. Dacre, which he quite agreed with, though, not having heard all the paper, he did not think that gentleman would have gone so far. The motion was then put and agreed to unanimously.

Mr. CARRICK, coroner, believed that the Game laws caused a great deal of misery in families, together with loss of life, and many other sacrifices; and he held a great many inquests on persons whose lives had been lost under them.

Mr. FRASER, so far as the Game laws were concerned, would never bring the subject before the Penrith Club again, for in that quarter he had given up all hopes. Not three hands would there have been held up in favour of such a resolution as they had passed to-day.

A vote of thanks to Mr. Dacre and to the Chairman brought the proceedings to a close.

THE GAME LAWS.

A large number of the electors of East Cornwall met their senior representative, Sir John Trelawny, M.P., in the Liskeard Guildhall, at his invitation, in order to confer together on the Game-laws. Mr. Raby, mayor of Liskeard, was called to the chair.

Sir JOHN TRELAWNY said he had the more satisfaction in bringing the subject of the Game-laws before his constituents because Cornwall was a county that had very often been ahead of the rest of England. He recollected his father telling him that in the Reform movement Yorkshire and Cornwall were the two first counties to declare themselves in favour of the Bill. He hoped, therefore, that Cornwall would not be backward upon the present occasion. The question of the Game-laws had been dealt with on both sides of the House for the purpose of political capital without anything being done. It was time that an end should be put to this state of things. There was a grievance, and it ought to be got rid of. Since his election for that constituency he had thought it desirable, for many reasons, that he should do nothing towards weakening the hands of the Government, which had had under its charge great measures affecting the interests of the empire. Not that he had always approved of the acts of the Government. The record of his votes which he had in his hand would

show that whenever he had thought them wrong—as he had sometimes done—he had always voted against them; and he now believed that the time had come when this most vital subject should be dealt with. He was rather a veteran in relation to it. Thirty years ago he had first appeared in that town-hall with the present Sir Robert Collier. That was in the days before protection was abolished. And not many years later—in 1845-6—he formed one of the committee on the Game-laws moved for by Mr. Bright, which sat for two years and produced the report which he held in his hand. At that date it was said that the farmer could not live unless he obtained 56s. per quarter for his wheat. What was the price that day? [A VOICE: "58s."] When that statement was made it was suggested whether there were not some circumstances connected with agriculture of considerable difficulty, and which tended to make it impossible sometimes for a farmer to raise his rent out of the estate which he held—whether it was not possible that there was often production in one particular line which might do injury to the crops of the farmer, whether there might not be such a thing as an over-production of game. Well, in consequence of this, the committee of which he spoke was moved for; and although the Government of the day had considerable power in it, and

although the resolutions which Mr. Bright moved were not adopted, still the report of the committee indicated the necessity of an improvement in the Game Laws, and would, if acted upon, have made considerable changes in the law, particularly as regarded the question of cumulative penalties for poaching, some of which still remained in force. It was resolved by the committee that the penalties for sporting without a certificate appeared excessive, and that the time for giving notice of appeal should be extended. It was considered, in fact, that the evils connected with the Game Laws were growing evils, and ought to be dealt with as soon as possible—yet from that date to the present these laws had remained, and it was for the agriculturists of that district to show (if it was their opinion) that they did not think the question was upon a satisfactory footing. There had, however, been several attempts to deal with the subject, and he held in his hand the five bills which had been introduced for that purpose. His views upon the subject had been expressed in the letter which no doubt many of them had seen, but he would proceed to state them at greater length. First, there was the bill of Mr. Peter Taylor, which was for the total abolition of the Game Laws. He confessed he did not see his way to a proposal of that sort—to the doing away with the laws without a penalty attaching to the act of trespassing upon a man's land with the view of destroying anything thereon. A man might come upon an estate, if there were not some means of enforcing an objection, until he set up a claim to the property. The permission of continued poaching upon a man's property, which the unconditional abolition of the laws would involve, was a matter which affected tenants as well as landlords. Were they prepared to see poachers prowling by night over their estates, where they had no right to come, without any power to tell them they must be off? ("No, no.") There was an intrinsic feeling of justice in the case, and he had never been able to say he was entirely against game laws, because he felt there must be some means of dealing with a person who thus prowled about. But this was a very different thing to defending cumulative penalties, or the power of instituting costly and vexatious proceedings. In eleven years he had done all he possibly could to get over this difficulty, but there was scarcely any plan that was not open to objection. Recently he had tried that of Mr. Sturt, who put confidence in his neighbours, kept no keepers, and had as much game as he wanted. But though he (Sir John) thought the present state of the law untenable and most impolitic, he saw difficulties even in this plan of Mr. Sturt's. He knew a place where there was no keeper, and where, in consequence, there was not only evening poaching, but parties went into the woods with ferrets regularly on Sunday mornings, causing a great scandal to the neighbourhood. These were facts that made people stop and think whether it was altogether possible to do away with punishment. [A VOICE: Trespass.] Well, they might have a law of trespass, but if it was to be effectual it would only be another Game-law. Any punishment for mere trespass would be only nominal. The party procuring it would be laughed at, and the offence repeated again and again. Mr. Taylor was the Nemesis of neglect. It was with the Game-laws as with other matters—when grievances were not remedied people came forward who went for the entire abolition of that out of which the grievances arose. And in so doing in this case they would get rid of one remedy for admitted evils before they provided a new one. They might retort the argument upon himself by calling him the Nemesis of neglect on the church-rate question. Well, perhaps he was, but he had always felt, when advocating the abolition of Church-rates, that there was no danger whatever of the fabrics of the church not being supported. The event had proved that he was right. Not only had existing fabrics been maintained, but some of the finest specimens of church architecture which they possessed had since been erected. But the case of the Game-laws was not parallel. Their total abolition would not provide any remedy against the trespass which they desired to prevent. Mr. McLagan's bill applied particularly to Scotland, and did not deal with the whole question. Mr. Hardcastle's bill would not be listened to for one moment in these days. It proposed to make game property, and to treat the poacher as a thief. It had another defect; under it any one might trespass and kill what game he pleased with impunity, but if he picked a bird up then he would be proceeded against as a

felon. Sir H. Selwin-Ibbetson's bill had many important points, but still in his opinion it could not be regarded as a settlement of the question. It dealt with the letting of game, which was a most important point. It seemed exceedingly hard that a landlord should be capable of arranging with his tenant to take £20 instead of £50, in order that he might have the enjoyment of the value of the £30 in the shape of game reserved, without any contribution being made to the rates in respect thereof, seeing that those rates were applied to punish offenders against the Game-laws. It might be said that the owner had a right to do what he liked with his own, but there were the rights of the ratepayer also to be considered; and it was a very important question to him whether his money should be taken to enable the landlord to be satisfied with £20 a year in money, when under different circumstances he would be entitled to £50. And there was another point: If the landlord told the tenant he was going to keep so much game the tenant could calculate accordingly; but supposing he kept a larger quantity, or "young master" came to the estate and did so, where was the tenant then? He had no claim for compensation, and was afraid to say much about it because he thought it quite possible that the result might be unpleasant. He (Sir John) could not help recollecting that until very lately they had had a landlord's Parliament; and that it was really only within recent years that it had been unnecessary to have a qualification in order to shoot game at all. The landlords had had a great deal to do with the enactment of the laws which affected the rent. In England they had the law of distraint, and in Scotland the still severer law of hypothec. Under these laws if a tenant had all his crops destroyed by game, he still could be made to pay his rent in full. A contract between landlord and tenant which permitted this was contrary to public policy, and should be void for uncertainty. A promise to do that which was impossible must be void, and a promise to pay rent for an estate when the game ate down every single blade was impossible of fulfilment, and should be void accordingly. There was a very large acreage over which tenants had the right to kill hares and rabbits, and he saw that some chambers of agriculture had expressed an opinion that if the tenant had a right to kill off the four-footed game, the evil of the Game laws would be removed. But what about the woods which interlaced the farmers' fields. His experience was that when farmers were allowed to destroy the game in them, they found that whilst they were very good at producing food for the hares and the rabbits, they were clumsy at killing them. He believed the best course would be to employ a trapper and clear off the rabbits, leaving only so many hares as were required, or killing all if needful. But even that did not get rid of the farmers' grievances. Supposing 1,500 pheasants were turned down for a battue for some great lord or other, what was the tenant to do then? The fact was that the subject required to be dealt with on a larger and more comprehensive basis. Some of the bills of which he had spoken contained too much, others too little; nor was the bill of the Government at all more satisfactory. Now the report of the committee to which he had alluded would well pay perusal. It contained the evidence of 72 witnesses, among them such people as the Duke of Grafton, Lord Hatherton, Sir Harry Verney, and Mr. Pusey, besides a number of experts; and they spoke out pretty plainly. The Duke of Grafton would destroy all hares; Sir Harry Verney had given up game-preserving, because it destroyed a fourth of the crops; Lord Hatherton believed game-preserving and improvement of land perfectly incompatible; Mr. Pusey held that the modern system of farming was not consistent with the preservation of wild animals, except under artificial means. Mr. Phillips, under-Secretary of State for the Home-Office, pointed out defects in the administration of the law. The magistrates were a most honourable body of men, but they were not all versed in the law; they had often acted in excess of their powers, and their judgments in different parts of the country were frequently contradictory. Mr. Phillips also showed the effect of the cumulative system of penalties, under which in those days a working man might be mulcted in £35 for killing one rabbit. The effect of all this was that people in the neighbourhood of a person convicted, so far from sympathising with the owner, sympathised with the poacher. This was an evil, because the laws of a country ought to have the general sympathy and approval of the people of that country. He (Sir John) would rather have these cases dealt with by the county court judges. He wished

to say nothing disparaging of the magistrates; but the county court judge would be a kind of arbiter between the two. He would know the law; there was always a bar present, whose acquiescence in effect his decisions would have. The press would also be represented, which was not the case when these matters were dealt with in out-of-the-way holes and corners; and, finally, a greater regularity and accord in the decisions would be secured. Then the right to buy, kill, and sell game should not be limited by certificates. The whole thing might be swept away at once, and probably some provision for a fence time substituted. If necessary, a rather severe law might be framed with regard to persons who might be convicted of intruding to commit some attack upon property, and who might often be burglars, intending to plunder the tenant as well as the land. Cumulative penalties should not be inflicted; and there should be a legal remedy by action for damage done to farms by game on adjacent estates. When Mr. Bright's resolutions were rejected by the committee of 1845-6, he had prepared others which were also rejected, but which he found represented pretty nearly his views at the present day. He believed that keepers had done a considerable amount of injury in the killing of kites, hawks, owls, weasels, stoats, cats, and the like. All he knew was rats had wonderfully increased; and he had thought of advertising in the *Morning News*, "Wanted, weasels for certain estates in Pelynt." Many of the animals that were thus killed were really beneficial to agriculture; and thus they saw another evil effect of the Game-laws. In conclusion, Sir John, whose speech occupied an hour and a quarter, stated that he had brought the matter forward from an earnest desire to do what he could for the promotion of agriculture and the benefit of agriculturists.

Mr. C. SPEAR went for total abolition, and denounced the treacherous character of gamekeepers.

Mr. Bowhay seconded this.

Mr. Row thoroughly endorsed Sir John's views, and moved a resolution expressive of approval thereof on the part of the meeting, and a hope that Sir John might long represent East Cornwall.

Mr. Bishop seconded this.

Mr. W. SNELL said that three years ago Sir Massey Lopes and other landlords had told the Devon and Cornwall Chamber of Agriculture that if the farmers only waited something should be done. They had waited, and things were worse than ever. He knew one estate in that neighbourhood from which more sacks of rabbits and fewer of wheat were sent yearly; and they saw what had been done at Ladock, where the attempt to search a tenant-farmer had been met, as it ought to be, by the farmer knocking the keeper down. He wished some of the landlords would try the right of search in their own persons and meet a similar reward.

Sir J. TRELAWNY remarked that he had voted against the Search Bill.

Mr. W. SNELL believed that if they could get rid of hares and rabbits they would do, as the winged game would be of very little consequence, and moved accordingly that the tenant by legislative enactment should have full power to deal with them as he pleased.

Mr. Raby, sen., seconded, and the motion was supported by the Rev. Mr. Berkeley and Mr. Dingle.

Mr. N. STEPHENS advocated total abolition, and on a division the motion to that effect was carried by a very large majority, neither of the other having many supporters.

Thanks were then voted to Sir John Trelawny and the mayor, and after cheers for Sir John the meeting separated.

KINGSCOTE AGRICULTURAL ASSOCIATION.

The December meeting was held at Hunters' Hall Inn, Colonel Kingscote, C.B., M.P., in the chair.

Mr. B. DREW read the following paper on Fences and Hedge Row Timber. I have been called upon to bring forward to your notice a short subject on fences and hedge-row timber, and short it must be to make room for the unfinished discussion of the far more important subject which Mr. Burnett gave us last month. Insignificant as my subject may appear to be, I trust you will all agree with me, whether steam cultivation gets into general use in this neighbourhood, or we cleave to the old system of cultivating our land, that it is desirable that we bestow a few thoughts on fences and hedge-row timber. Time was, and that I am informed not 80 years ago, when fences were few and far between, and since then many of them have been put up in a very random kind of way, for we know lots of fields that have eight or nine corners in them when there is no need of more than four. Many fences are as crooked as my subject will probably be, when they might be as straight as an arrow. Many acres of both arable and pasture land could be made in England by putting the fences more like the lines on the chess-board, and the present quantity more easily ploughed, sown, reaped, and mown. There are many obstacles in the way, I will own, to the making many fields of the shape that we could wish, such as boundary fences, railways, &c.; but, where it can be done, I think we should do well to put our shoulders to the wheels of improvement, and push them in the direction of our fences. With respect to the width and height of hedges, perhaps I shall tread on very tender ground, or at all events, I shall tread very heavily on my own toes when I say that I uphold a well-trimmed, well-kept fence—a fence that a good hunter would have to look well to what he was about before taking it, and land safely on the other side. I mention such a stiff fence because, if kept out much closer, the hedge, after a time, in my opinion, would be, as I believe should be, by being kept short, rather withered. The late Lord Ashburton's plan of cutting hedges, where there was a double row of quick, was to cut one row down to the ground, and, after two or three years, cut down the other row; but I

cannot say much in its favour, never having seen good hedges where they were so served, and his tenants did not follow his lordship's plan. I do not know of a better way to serve hedges when they get old than have them staked and heathered, and have all briars and other worthless stuff extracted from them. I cannot too strongly condemn the cross-thorn and the yew bush—the former causes the corn to blight round it, the latter is injurious to cattle. I speak from experience, not from old wives' fables, with regard to the yew tree being poisonous, both in its green and dry state. But, like Thomas of old, there may be some present hard of belief with respect to the corn being more subject to blight near the cross-thorn; but I have proved by experience that it is, having seen the blighted spots near the cross-thorn when in no other part of the field. The weeding of hedges, in my humble opinion, should be carefully attended to, particularly as to thistles and docks. "If weeds grow apace," and should be prevented doing so wherever they are known to grow. I have heard it remarked that thistle-seed will not grow when blown away, but some of us in this room have proved it to be otherwise. My late brother Edward grew some in pots, on which he tried the experiment, by blowing the seed across the room. Last summer I had so very many thistles in my young seeds, that I thought I must have sown thistle-seed; but when I came to consider that my brother William, at Bowdown, had some seed from the same lot without thistle-seed, I began to think otherwise, and so I do now. Mr. Peters, on Serubbet's Farm, had a quantity of thistles on a piece of seeds, close by a plantation; and the farther from the cover the less thistles there were; and in the fields that I had the nearer the woods the thicker the thistles. But much as I am convinced of the thistle-seed blowing and growing, we should nevertheless be always careful to look well to the quality of our seeds. Where ditches are required they should be carefully cleaned out, but in many places on the Cotswolds I see no use for a ditch; and my reason for condemning them, where I can, is that I have had a few sheep die on their backs in them at different times. Rough grass should not be permitted to grow long, for it encourages those

worst of all pests to farmers the rabbits, and there are not many of us who wish to do that, I am sure; for who can keep a good hedge or grow a good crop of corn where they are permitted to dwell? I cannot speak too strongly against rabbits, for, I am quite sure if landlords as a body could see and feel as they ought to do with respect to them, and as I am quite sure Colonel Kingscote feels, there would be thousands more of happy homes in England. How can a farmer be comfortable when he has tried his best to secure good crops and afterwards sees them eaten up by rabbits? I will now say a few words on stone fences. I cannot say much against them, but I would say something in their favour. How many comfortable buildings are made of stone walls! This room would feel somewhat chilly with ever such a good hedge round it, if it were not for these four stone walls. Our sheds and yards too would be the same for our cattle; and one would almost be led to suppose thereby that walls must keep the wind off our fields better than hedges. With regard to the fly, I have often observed cattle very restless between hedges, when they have been comfortable between walls. Stone walls, if properly kept up, make good fences, but if neglected, like all other fences, often cause pounds of damage, from cattle and sheep getting in to the standing corn or grass. It is vexing at the best of times to see cattle trample down a lot of corn, but when it is through the farmers' own carelessness it is doubly annoying. When fences get old their cost is something like that of old harness, that costs more to keep it in repair than new would cost. Mr. Burnett can bear with me with respect to the old harness, for he once gave it up, and had new, and was in pocket by it. I have been rather surprised to see what had foundations some walls have been built upon, when a little extra digging would have secured a good one; hence the many falls after an abundance of rain. The walls themselves vary in height as much as do giants and dwarfs, and even in the same wall we see them a height of seven feet in one place, and a few yards farther on a height of about two feet. Can it be wondered at that our own and our neighbours' cattle occasionally eat of the same pasture? In these days of foot-and-mouth disease we cannot be too careful in keeping our fences good, and our cattle at home. Another reason for good fences is that if cattle get out a few times they learn the habits of the rover, and are never satisfied at home. We should therefore try to have the best of fences, and I believe we cannot have a cheaper or better one than a good stone wall about four feet high, or at all events one high enough to keep the cattle in, without risking the neck of the horse and its rider. I say the "good" rider, for a bad one risks his life over a two feet wall. To bear me out in what I say, that we cannot have better fences than walls—where there has been one edge made to part fields in this neighbourhood lately, there have been 100 walls, where stone can easily be dug on the land. It is a cleaner fence, both as regards the weeds and the rabbits, than the hedge. But I will not run down either the wall or the hedge; both are useful even to us on the hills, and what must the hedge be to those who farm in the charming vale of Berkeley? Although the good trees do much damage to hedges, I am not going to speak against them; it is to those worthless pollards and lots of others that I wish to apply the axe at. They neither add to the beauty of the landscape nor put a fraction in the landlord's pocket; but their roots often come in contact with the plough and its tackle, causing lots of damage in a few years. I have known searifiers never go so well afterwards by getting in the roots, and where there are many such trees, it is almost impossible to keep a good fence, either a hedge or wall, for the tops kill the hedges, and the roots throw down the walls. I had leave about twelve months ago to cut down a worthless tree. I found that its roots ran under a wall and it threw down a rod, and often two, of wall twice and thrice a year ever since I can remember. I need scarcely say that I cut it down. Several similar cases have occurred on the farm I occupy, but not to the extent of damage; but two cases of greater loss—one in which an ox got hung in the branches of a stick, and died in it; and the other happened a few weeks ago, where the death of a yearling happened, by its slipping into the water under a limb of an old tree in Ozleworth brook. I have often seen hats fall, and I was going to say almost heads too, by coming in contact with the low boughs of trees, generally speaking of worthless trees, for trees of any value usually carry their branches higher. If landlords would condemn the worthless trees, as wolves were condemned in England many years ago, even by slaying the

last one of them, I do not think anyone would sing the old song over them:

Woodman, spare that Tree.

Now for gates. What shall I say in respect to them? First of all I would look at the posts, and see if they are good and firm in the ground, for if the hanging-post is loose, very likely the gate drags along the ground, and gets injured by so doing, and often left part of the way open, when the cattle get out and do lots of damage; and if the falling-posts are loose the wind blows the gate open, and the gate itself should ever be kept in good repair. Whatever the excuse be for having bad gates and posts, such excuse will never justify those whose duty it is to keep them up or see that they are kept up.

The CHAIRMAN agreed with all Mr. Drew had said. There was no doubt but that it would be great economy to have many of our fences put straight; and in the vale there surely were too many fences, and by far too much timber in the hedgerows. To have good hedges the management must be very different. There was a great difference in the appearance of hedges in Leicestershire and Gloucestershire. He did not believe in the system of planting hedges on a bank, and when they were cut leaving the thorns in the ditch or on the bank. There could be no really good fences where there were many rabbits. As farmers had the hedges to keep, they ought to be placed in the position to do so properly, and have a right to kill rabbits. On our hills walls made the best and cheapest fence. He believed that if they were properly put up on a good foundation, there would not be so many shards after heavy rains.

A discussion followed, on the various systems of planting and training, &c., in which Messrs. H. Hayward, Bennett, Blackwell, C. Holborrow, and J. Harding took part, and the following resolution was carried:—"That hedges ought to be planted on well prepared soil, nearly on a level with the surface of the field, should be kept low as long as they are thick at bottom, carefully weeded and free from rabbits. Stone walls are preferable where stone can be got. The fewer trees in or near the fence the better, and no useless ones allowed to stand."

A vote of thanks was acknowledged by Mr. Drew; and the discussion on the subject under consideration last month was then resumed.

THE NORFOLK AGRICULTURAL SOCIETY.

At an adjourned meeting of the Norfolk Agricultural Society, Mr. C. S. Read, M.P., presiding, for the purpose of electing a President for the current year. The following letter was read from Mr. F. Knollys:—

Sandringham, King's Lynn, Jan. 5.

Dear Sir,—With reference to the meeting of the Norfolk Agricultural Society which is to be held at Norwich to-morrow, I am desired by my father to say that you are at liberty to make an un-official communication to the effect that he understood from the Prince before his Royal Highness' illness took place that he would accept the office of president of the association with great satisfaction, on the condition that the meeting should be held at Lynn.—Truly yours, F. KNOLLYS.

The CHAIRMAN said that it was most desirable that His Royal Highness should accept the office of President, more especially as he lived in Norfolk during part of each year. The acceptance of the Presidency by the Prince would confer a great honour upon the Society and upon the farmers of Norfolk, as the chair now vacated by one of themselves would be occupied by the future Sovereign of England.

The Prince was then unanimously elected to the Presidency, and it was also agreed that the next year's meeting should be held at Lynn.

COL. FITZROY moved a resolution to the effect that the members of the Association in general meeting assembled, desired to express their heartfelt thankfulness at the improvement which had taken place in the condition of the Prince of Wales, and also their earnest hope that His Royal Highness might with the blessing of Almighty God be soon restored to perfect health.

The CHAIRMAN said he would take it for granted that this resolution was carried unanimously.

The proceedings then terminated.

FARMING IN IRELAND.

BY THE NORTHERN FARMER.

For a considerable number of years back, dating as nearly as possible from the failure of the potato crop, when the change of the times produced by the gigantic calamities through which the country then passed caused the payments for labour to be made more in cash than in kind, Irish agriculturists have been divided into two great classes, each class following an exactly opposite and distinct course, in cultivating the land from which they derive a living. Each partly maintains nay, even brings forward statistics to prove that the system they follow is the correct one, not only for promoting their own individual interests, but the good of the country at large. The two sections are thus constituted: first, those who ignore labour, whose every effort is devoted to its expulsion, the preservation of the land in grass, and whose constant endeavour is not to live by cultivation, but by a species of management, which aims at an easy life by the profits derived from grazing cattle and sheep, whatever the quality of the land, whether suitable or not for such a purpose. The well remembered and oft quoted saying of the late gifted Lord Carlisle, that Ireland's destiny was to become the fruitful mother of flocks and herds, is ingeniously constructed into a prophetic warning that the growth of grass and raising cattle would in a few years entirely occupy the time and take up the attention of the Irish farmer, and that although the stock might have somewhat hard lines during a severe winter and spring, the abundant grass of summer and autumn would amply make up for all previous drawbacks and deficiencies. The favourite argument of this class is that there are no heavy bills running up, and all such items as seeds, manures, and expensive implements quite uncalled for. A farmer, instead of being a drudge, compelled to be up betimes to look after a staff of workmen, who unless he did so would speedily impoverish him by their carelessness and neglect, leads a life of ease, comfort, and contentment, his total outlay in the way of labour, the payment of one man, who attends to the stock and reports progress at stated intervals. On good land this system can be successfully carried out, both store and dairy stock getting tolerably over the winter without the shelter of a house, and receiving a daily allowance of hay, thrown on the pastures. The opposite section also quote the same authority, but give to the well-chosen words, and beautifully rounded periods of the amiable and popular nobleman who uttered them, a totally different construction. They maintain that the soil of Ireland, to enable it to become a land of flocks and herds, should be intelligently and diligently worked, large capital employed in its cultivation, and a course of husbandry followed which will embrace the employment of a regular staff of labourers, encouraging them to remain in the country instead of driving them out of it, the use of the best implements and machines, and the growth of a large breadth of green crop, to give abundant food for live stock during the winter. It might very easily be supposed that the latter have the best of the argument, more especially when they carry out in practice what they profess in theory, and show by the quantity of corn they can grow, and the heavy stock they can at the same time hold and provide food for at all seasons, that the conclusions they have come to with regard to the most profitable methods of farming are based on sound reason and common sense. Statistics are altogether in

favour of working the soil on a regular system of convertible husbandry, its products being so immensely increased, the stock kept of better quality and vastly greater numbers, labour regularly required and fairly remunerated, and individual and national prosperity promoted in a degree altogether unknown and totally unattainable by the system which seeks, by a selfish seclusion, to shut out all participation in the benefits to be derived from the culture of the soil, with the single exception of the occupier himself and his own immediate family. The large breadth of waste land in Ireland capable of being improved by being put under a proper rotation, and by the expenditure of a little money per acre, but which at present affords but a wretched subsistence for a few miserable half-starved animals, is the strongest argument of all in favour of regular cropping against the let-well-alone system, which dooms vast tracts of country to a state little better than that of desolation and solitude.

A few weeks ago, having accepted a long-standing invitation to visit an old friend and fellow-countryman farming in the county of Cork, I had an opportunity of seeing a farm worked on one of the most popular systems of modern husbandry, viz., a six-course rotation, not however slavishly adhered to, but extended or shortened according to necessity or convenience, an extra crop of corn being taken if the condition of the soil warrants the interruption, or the grass extended for a year or more, if the extra good quality of the pasture or the exigencies of the season render such a course desirable. The rotation is as follows: 1st oats, 2nd green crop, 3rd corn, 4th hay, 5th and 6th pasture. The regular course may be broken if necessary by letting wheat follow the green crop, haying down in the following year with barley or oats. This break is left altogether to the discretion of the tenant, and may with great propriety and excellent results be carried out, when the field is naturally a good one, and besides in high manurial condition at the time. From a few notes taken on the spot, I have written out this short article, which may not prove uninteresting to the readers of *The Mark Lane Express*, referring as it does to the agriculture of a country in which the Farmers of England have such a direct interest, so much of their store stock being drawn direct from its pastures. The buildings on this farm are of modern construction, the house large and commodious, and the whole range of buildings, stables, feeding-stalls, barn, engine-house, and straw-shed, so regulated as to afford every facility for feeding the stock while they occupy the stalls, the preservation of the food and litter from injury by exposure to the weather, and economy of labour, the latter requiring quite as much attention in Ireland as in any other country, so great has been the change brought about by emigration, and various other causes. The extent of this farm is nearly 300 acres, on which there is not a bit of waste; and being worked on a six-course system, it gives as nearly as possible 46 acres each year for green crop, a little under or over, according as the acreage of the fields may be lesser or greater. Forty-six acres of green crop, with a proportionate quantity of corn, implies a large amount of labour, demanding the continual attention and supervision of the farmer himself; any one living solely by land and above being his own manager, having but little chance of success, the work falling continually

behind, and much of it badly done. Unlike the great bulk of farms in the neighbourhood of Cork city, the dairy is not an important feature, the green crops being principally used in stall-feeding bullocks, two lots, if at all practicable, being turned out in the course of the feeding season. This could not be accomplished but for the excellent grass-growing capabilities of the soil, and its good fattening qualities, the first lot when tied up about the first week in November being *good beef*, turning out *prime* for Christmas and first fortnight of January, after a couple of months' turnips and a liberal supply of cake. Another lot is in readiness to fill the stalls as vacated; but these being more properly stores, are not sufficiently fat to be got rid of sooner than end of May or beginning of June. The top prices realized are £27 each for three-year-old bullocks, when properly finished, from £18 to £22 for two-year-olds, although at times as much as £26 10s. has been got for the latter, when prices happened to be exceptionally high from local scarcity, and for yearlings from £11 to £13. I saw nothing that convinced me so thoroughly of the excellent qualities of the soil in this locality, as the condition and value of the present year's calves, and the price realized for those of last year, a portion of them having been sold fat in the first week of June at £12 each. Merely fat calves worked up to such a price at a far earlier period of their existence, would be no matter of surprise; but cattle that got only store-feeding, out by day and housed by night, with a little hay and turnips to eat during the entire winter, and that made one pound a month at the age of twelvemonths, certainly leaves but little to be desired in the shape of improvement. Up to the date of my visit, 1st November, none of the cattle were tied up, there being no necessity for it, the weather, although wet, being mild, and the pastures clothed with such rich abundance of grass, as to remind one forcibly of a very growthy month of August. The strong rich grass, green as a leek, looked as if it would carry a heavy store stock right through the winter on to next seasons' growth without roots, fodder or shelter, other than that afforded by the fences. The tenant's mode of availing himself pecuniarily of this abundance, is to purchase sheep to clean up the pastures on the removal of the cattle to the feeding stalls. By the end of January these sheep are cleared off thick fat, giving the whole range of the pastures to the breeding ewes during the spring, a good rough bite being still left for them, unless nipping frosts have been unusually prevalent, and the weather otherwise severe. The occupants of the pastures awaiting the first break in the weather, as the signal of removal to the stall, were 30 bullocks and ten heifers, varying in age from two to four years. The top animals of this lot would run from 5½ to 7 cwt. dead weight, and were value for close on £20 a head to the butcher. It would be hard to find better animals for feeding purposes than these were, and going in fit to kill, a very short period, with a liberal allowance of cake along with the roots, would finish them splendidly. Putting in lean cattle to fatten on expensively-grown and purchased foods, scarcely pays under almost any conditions, in any country, the food consumed during a protracted period being enormous, absorbing with the working expenses the whole of the margin remaining after deducting prime cost. In connection with stall-feeding cattle, it appears to me to be an indubitable deduction that the feeder who is so fortunate as to possess pastures of good fattening properties, is the only man who can calculate on a good profit with any degree of certainty, the stock requiring to be made nearly fat by a less expensive process than that of tying by the neck, and forcing with roots and oilcake.

As already stated, the dairy is not a leading feature on

this farm, in which respect it differs very materially from nearly every farm in the district, butter-making and rearing calves being the branches of husbandry principally attended to. As an illustration of the extent to which dairy farming is carried out in the immediate vicinity of the city of Cork, I may mention that the farm bounding that which I am describing feeds a standing herd of seventy cows—all splendid animals, of pure Shorthorn descent by the sires, the latter being invariably purchased from breeders who use hired Booth bulls continuously. The fine waxy horn, rich colours, straight backs, broad hooks, well-filled thighs, and great weight of carcase, showed the origin of each individual member of the herd most unmistakably. To look at these cattle as they slowly wended their way to the homestead to be milked, was a sight capable of affording an agriculturist, whatever his nationality, a vast amount of gratification, and to an enthusiast was well worth going a great distance to see. The produce of this dairy is converted into butter, and sent fresh by rail to Dublin, a distance of 160 miles, where it commands a price considerably over the current market rates. Belonging to the same owner was an equally fine herd of young cattle of different ages, many of them having the distinctive marks of pure-bred Shorthorns, requiring only the care usually given to a select herd by wealthy owners to bring large prices, if brought to auction and extensively advertised. This *en passant*. The sheep stock on my friend's farm is, for the most part, managed in a way becoming very popular in the south of Ireland, viz., to purchase the greater portion of the breeding ewes every season, a few choice specimens only being held over while they continue useful, the lambs sold fat early in the summer, and the draft ewes cleared off in small lots as soon as they get themselves into saleable condition. The first sale of lambs has been occasionally made as early as the middle of April, in which case the ewes have abundant time to become fat before mutton has sensibly fallen in price. So near Cork as four miles there is not the slightest necessity for taking stock of any kind, either to fair or market, dealers being only too glad to purchase in the stall or on the pastures. So quickly is this kind of business done at the present day, that an animal may with all ease be grazing on the verdant slopes of Blarney or a spur of the Galtees on one day, and in little more than twenty-four hours afterwards its quarters exposed for sale in the shop of a Bristol or Bath butcher. In holding over breeding ewes from one year to another, the preference is given to twin-bearers, so as to secure a good fall of lambs, the succulence of the grass enabling the ewe to rear a couple easily. The average of the present year's crop of lambs was 30s. each, some of the twins going off early in May, thus returning £3 for the offspring of a single ewe, making in all £3 10s. when the price of fleece is added. The idea of specially selecting twin-bearers was to me altogether original, but it appears an excellent one, only fit to be carried out, however, on farms where liberal treatment is the rule and not the exception. In following out this idea, the owner of this flock told me that he had in one instance kept a ewe until she was 11 years old, and another till the age of 13 years, both having bred with unvarying regularity, and on some years rearing triplets with as much apparent ease, and quite as successfully with regard to the average amount of cash they made, as many other ewes did that had only a single lamb. The flock of breeding ewes numbered 130, mostly long-woolled, of no distinct breed, but useful looking, and of good size, the smaller number, Shropshire Downs, purely bred and strikingly handsome, the whole running with imported Border Leicester rams, this breed outstripping every other in popular esteem in this and many other districts in Ireland. Although largely used with cattle, no concentrated food in the

shape of cake or corn is used with the ewes, a few roots only being daily strewn on the grass for some weeks at that very critical time on all farms, when the old grass is all but exhausted, and the new scarcely forward enough to furnish full subsistence for a heavy stock, the pastures therefore become their principal dependence throughout the year. On few farms in the province of Munster are green crops to be found of ordinary excellence this season, the excessive rainfall of the late summer and whole of the autumn, instead of assisting the roots to make a quick growth, and so enable them to make up for time lost by the drought of spring and early summer, rather retarded growth, by keeping the soil too cold, as evinced by the under leaves of both turnips and mangolds turning prematurely yellow. This farm, although a good one, is no exception to a rule so very general, and roots will be quite scarce enough to require husbanding, an increased difficulty in holding over the usual number of heads being met by laying in an extra quantity of cake. While walking over the field on which the chief portion of the green crop break was situated, I found it level as the surface of a lake; and the day being a teeming wet one, it was evident that the water was not absorbed quickly, in consequence of the soil being previously overcharged with moisture, the result of continuously drenching rain. This retention necessarily caused an unseasonable lowering of temperature, the soil became soured, growth languished, and hence serious injury to a very valuable, and perhaps the most important crop of the entire series. This field, and a considerable stretch of land on the same level, was at no very distant date covered with water, but of late years it has been converted into the finest feeding land in the whole district, through the improving medium of an elaborate system of arterial drainage, conceived by, and executed under the untiring personal superintendence of the late St. John Jeffries, one of Ireland's most distinguished agriculturists. The works were taken in hand at a time when adversity pressed heavily on all classes, landlord, tenant, and labourer being too frequently involved in universal and unavoidable ruin. Large numbers of men were employed on this most useful work, teaching those who were entrusted with the public money a valuable lesson as to its expenditure, if they would but profit by it. This, however, they seldom did, spending the greater portion of it in opening up useless roads, on which there has never been, or is likely to be such an amount of traffic as would warrant their being kept in repair, most of them remaining to this day standing monuments of official absurdity. "Ah!" said an old labourer to me, with whom I happened to get into conversation, "these were, indeed, bad times; men were so plentiful, and work so scarce, that the heartiest man had no chance of getting employment on account of his services being required: he could only go cap in hand and ask to be taken on for 'Godsake.'" Himself and sons were employed on the drainage works, and, at the worst of the famine times, counted it an especial favour if permitted by the manager to fill up drains by moonlight, so as to eke out the scanty wage earned by cutting them at so much a perch. But little trace is now left of that never-to-be-forgotten time, emigration having thinned the ranks of the farm labourers, rendering their scarcity nearly as much a matter of note as was the previous plenty, and those that remain are not only better paid, but their services are in very earnest demand, causing their bearing and manner to be more manly and independent than it was in years gone by. Before leaving the subject of drainage, I may mention a fact which shows that Irish landlords are fully alive to the interests of their tenants, whatever their enemies may say to the contrary. Being informed that the rainfall was not absorbed as quickly as

desirable, the landlord of this farm had men at once set on to clean the mains—more like canals than drains, so great was the breadth and depth—and examine the connections, so as to ensure the perfect and rapid working of the whole system. This operation, although undertaken too late to serve this year's crop, yet was begun as soon as the necessity for it was observed; and certainly remedial measures being taken so quickly, showed a spirit on the part of the proprietor worthy of all praise. The fences on this and several other farms on the same property, are of excellent construction, designed and erected by the gentleman already noticed, the same master-hand being displayed in carrying out the details. The design embraces a threefold purpose, each being obtained in an eminent degree, the occupants of the fields being at once sheltered and secured, and the country beautified. The fields being mostly of extended area, containing from 35 to 45 acres, a shelterly fences became absolutely necessary, more particularly in a country where young stock of every kind have to spend much of their time in the open air during the winter season. The size of the fields permitted the fences to occupy considerable space, and yet be more economical of surface than is customary in the South of Ireland generally, where small enclosures and wide unsightly, and in many cases useless fences, are much too prevalent. Each fence is 22 yards in width, the enclosed space being planted with larch and other quick-growing trees thus securing a great deal of shelter in a very few years. The fence itself is constructed of stones neatly placed on edge, no mortar being used, but kept in position by a strong backing of earth, which is added and firmly packed with a rammer as the building goes on. The earth for this purpose is obtained from the outside of the fence, a trench a few feet wide being dug throughout its entire length, about 12 inches from the foundation of the wall, and when the work is completed the brow is sloped neatly down, the depression of surface adding much to the efficiency of the erection as a fence from stock. When the wall is two and a-half feet high, a line of quicks is introduced, a little fine earth laid on the roots, and the building continued as before, finishing at the height of from three to four feet, according to the physical conformation of the field, whether it adds to, or detracts from, the security of the fence. As the height is reached, a line of tough sods is run along the top of the stones and beaten firmly down, this making an excellent finish, and aiding greatly to keep the stones in position, and prevent their being thrown down by cattle rubbing or people getting over them. The hedge kept nicely trimmed from the earliest stages of its growth adds greatly to the beauty and efficiency of the structure. The utility of such a fence as is now described can scarcely be overrated, sheltering a flock of sheep at its lee side throughout the wildest gale or bitterest snow shower, as comfortably as in a roofed enclosure. During the lambing season the ewes with their offspring range themselves instinctively along the line of shelter, keeping in as straight a line it may be along the very outer edge as if protected by a net or hurdle. So far South, and so close to the Atlantic, at a point where the warm currents of the Gulf Stream exercise an ameliorating influence on its temperature at all seasons, snow seldom lies, being quickly melted, from contact with the warm vapours wafted from the wilderness of waters in the immediate vicinity, this local climatic feature giving the agriculturist one less difficulty to contend with in the management of his stock during winter. Strong gales and heavy drenching rains are, however, extremely prevalent, rendering fences which contribute to the shelter of the live stock of very great importance. Hay-racks, turnip troughs, and all necessary conveniences required in the management of a flock of ewes can be ranged on the sheltered side of the fence, adding vastly to the comfort of the sheep and their at-

tendants, and saving the lives of many lambs each season. Walking over the stackyard, I found it crowded with noble stands of farm produce, the hayricks above everything else being objects of admiration. The only good weeks for haymaking afforded by the entire summer having by great good luck been just hit upon, the quality was of the best, and the clover forced on by the incessant rains added largely to the usual bulk. On drawing out a few handfuls of hay from different parts of several ricks, I found the clover equal in length to the rye grass, a thing seldom seen, and only to be accounted for by the crop being cut later than usual, and the clover thus having time to perfect its growth. The only clover present was alsike, showing that the wet year was favourable to its growth, and giving, I think, a useful hint to growers as to its utility in laying out land with seeds. Straw being a plentiful article, there was no necessity for being sparing of its use, and it was used abundantly wherever it had a chance of being impregnated with the droppings of cattle. This plenty of such a useful article is by no means usual in the South of Ireland, so much of the land being in pasture; indeed, in some districts it is so precious as to be altogether inadmissible as bedding for any kind of stock, sand being used instead. In the markets straw commands as high a price as hay for the greater part of the year. A noble engine of eight-horse power, with powerful thrashing machine of the most approved construction to match, occupied a commodious building recently erected by the landlord in a position that conveniently commanded the whole of the stables, sheds, and feeding stalls in the original quadrangle. The last

of the barley stacks from a field of 42 acres was just being finished thrashing, the grain being weighed and stored in an ample granary. I had thus an opportunity of judging of a crop that is much complained of in the south this year, the constant rain having strengthened the clovers and grasses too much, and made the corn crop very hard to save. I found that the average of the whole field per acre was exactly 18 cwt., a result moderate enough on such land, particularly when conjoined with grain of but moderate quality. The implement house contained a selection of the very newest and best implements, the most prominent being a broad-cast grain-sowing machine, double-furrow plough, Wood's very newest mower, and a tiny-looking reaper, of which its owner gave a very high character for speed, close cutting, and general efficiency.

The leading points of interest in the immediate neighbourhood are the Turkish baths of St. Anne's, the domes and minarets of which were just perceptible in the distance, and the groves, tower, and lakes of Blarney, into the very bosom of which the higher fields of the farm I visited just looked. To this classic spot every visitor to the South of Ireland, whatever his rank, makes a pilgrimage, not considering his tour complete until he has done so. A remarkable feature of late years in the nationality of tourists is the shoals of Americans who every week during the season crowd its shady groves, their first inquiry almost on reaching land being about procuring conveyances for Blarney. Reluctantly I took leave of my kind host and his family, a perfect crowd of little ones accompanying me to the door and waving *adieu*.

FRAMLINGHAM FARMERS' CLUB.

At the last monthly discussion meeting, the subject for discussion, 'Medical Poor Law Relief,' was introduced by Dr. Rogers, the president of the Poor Law Medical Officers' Association, and the president of the Club, Mr. F. S. Corrance, M.P., who was in the chair. The Rev. C. T. Corrance read the following paper, which had been prepared by the President:

At a recent meeting of this Club I told you that I was not satisfied with the present social condition of the labouring classes. I gave you some reasons for this, and among these its pauperism. Of this figures best furnish proof. From the total returns we learn that there was expended for the relief of the poor:

In	£	s.	d.
1842 ...	4,911,498 ...	Price of Wheat ...	6½ 0 qr.
1870 ...	7,644,307 ...	" "	46 2 qr.

Now, what does this represent? So many paupers receiving relief. The report says that 4-7 of the population are paupers under the operation of the test. Now, consider the significance of this fact. Who become paupers? None, let us hope, willingly; of poverty it is the last gulf. What percentage then of the working class does this liability to pauperism embrace? How many are living day by day within its reach? I am afraid to furnish an answer to this, but I recommend it to those who take sanguine views of the state of the working classes. To my mind it discloses an appalling fact. How has this been brought about? Does it arise naturally out of our industrial conditions and the great division of classes into those who have by thrift, or industry, or genius, or strength, accumulated capital, and those who have not done so yet; or is it referrible to successive Acts of unwise legislation introducing into the relations of employer and employed a vicious theory, and practices as corrupt? For the present I pass by the first—a large subject in itself. The second forms the question for to-night. Now I am going to ask you to accept this dogma: That no poor-law can be sound in theory; very few such laws can be applied without mischief; but in

certain societies it becomes a necessity, and the question then is, how to apply it so as to minimise the mischief. Obviously the true direction will be found in prevention. Anything which does not tend to prevent creates dependence, and towards this there is a strong natural bias. I think it is Sir C. Lyell who tells us that if a man be placed upon a boundless prairie without any landmark to guide him, he invariably describes a circle to the left hand, because the muscles of the right are stronger. Depend upon it we shall do so in this matter without a principle of this sort to guide us. Nay, we have done so, and have been constantly moving in circles of this sort. Let this then be our test—prevention. Does this mean repression? The reformers of '34 thought so, and so do some of the same school now who run a-muck against schools, hospitals, and dispensaries sustained by charity or rates. I wonder they don't include gaols and reformatories, which are not self-supported by the rogues. Well then, repression is only a part of our means for prevention, and must not be used indiscriminately; and observe that, as up to this time very few and feeble efforts have been made except in this direction, it is clear we may have a great work before us. First, however, let us see what we have done, and for this it is necessary to go back a little. In former lectures I have spoken of the great Act of Elizabeth, the wisdom of which has not perhaps since been exceeded. At present it will not be necessary to do more than to glance at its practice, in order to contrast it with that which follows. In the first place, it confined the area of relief within narrow limits. It conferred no right to aid beyond the bounds of the parish; that is, within accurate local knowledge. It exacted work from the idle. It utilized charities. It localized the disorder by settlement. It made wise provision for the maintenance of the rights and independence of the poor. And it made every man according to his means contribute. Now, under the conditions of that time each of these provisions were preventive, and they are not provisions which at any time can be lightly disregarded. It is this that I will now undertake to show you by a brief history of the Act of 1834, and its subsequent amend-

ments, taken from authentic Parliamentary papers and official reports. Times changed, and great progress was made. That is, we went round again, and towards the commencement of this century the advance we made was so great, that half the population of every parish were in receipt of relief, and the rates were about 20s. in the pound. It became necessary to put back the Bill of 1834 once more re-established the greater principles of the original Act, though without any adequate recognition of the rights of the poorer class, in the matter of wages, and cottage garden, and allotments, to which I formerly referred. It restored the local Government, it restored parochial settlement. It localised the disorder. It imposed not work, but the workhouse test, and it forbade out-door relief. In its leading principles, suggested by great thinkers, or borrowed from the original Act, it was sound enough, but it was incomplete. It did too little, and it did too much, and it was most unfortunate in its external aspect and demeanour towards an unfortunate class. It was repressive, but not preventive. It was imperfect in its local machinery, and it was unjust in the incidence of the rate. Now, mark the results. For about five years it yielded a partially satisfactory result, and then it began to slake. Now let us see the evidence for this. In the year 1839 there was severe distress among the poorer classes, mainly manufacturing, but also among agricultural classes in the North, and the wheels of the machine began to creak. In the report of the Commissioners in 1840, we find the first warning note. They say: "That in the period elapsed since May 1st, 1839, continued and severe distress existed among the manufacturing population. In Hinchley, Barrow, and Barford, Mansfield, and Nottingham, it became necessary to suspend the regulations against out-door relief." A little later, and the rift had spread, and from agricultural unions there came the same complaint, the order having become general, though discretionary and permissive with Guardians. We find the Commissioners in a subsequent report, speaking thus: "The Commissioners quote as exceptions Market Harborough, Ashby-de-la-Zouch, and some others, where the Guardians were so convinced of its impolicy that the motion to adopt the order was lost." At page 9 of this report a table is given of four counties, viz., Bedfordshire, Kent, Sussex, and Norfolk, bearing a favourable comparison to Devon, Somerset, and some other, in which the order had been introduced. In 1842 things had become so serious that a committee was appointed to investigate the causes at table No. 4 of this report, given as its results, that of all classes there were 236,408 in receipt of out-door relief, and that of this number more than one-third were able to work. In the report of the year following, 1843, we find this remark, "That with respect to the increase of expenditure since '39, we fear that it must be attributed to an increasing laxity in out-door relief." Throughout the succeeding two years the increase was progressive, in spite of all the untiring efforts of the Commissioners. In 1843 we find the number relieved out-doors was increased to 1,108,315, and at page 9 of this report we shall find that even in the law of settlement a certain relaxation took place; and, as a further symptom of a want of intelligent administration, there was a general desire to reduce the salaries given to medical men, and vaccination was laxly carried out (see page 19 and 20 of report). In 1845 the country had returned to a normal state; and the eleventh report of the Commissioners speaks in a sanguine tone of the social state. The Poor Law expenditure for the year having been nearly stationary, a certain note of triumph is set up. At page 5 of this year's report we find a passage of some significance, which ought when we receive similar premature jubilation from official quarters, to cause us to reflect, viz., report page 5, section: "During the early part of this period, particularly during the year 1841, severe distress prevailed in most of the manufacturing districts, including that important part of the country where the manufacture of cotton is carried on. The depression of the manufacturing districts was, as a natural consequence, followed by distress in the agricultural part of the country. In 1844 trade revived, and the number of able-bodied incapable of obtaining employment was not considerable. Owing to this state of things the expenditure of the relief of the poor increased steadily in 1839 and 1843, but diminished in 1844. This fact proves that the amount of the poor rate is not, as some people have feared, governed by a law of constant and irresistible progression, but that, when subjected to proper control, it can be

diminished upon the return of comparative prosperity." The realization of their anticipations affords a measure of the wisdom either of those who made them, or those who have failed to justify them by their subsequent administration of the Act. At page 6, there is evidence that the subject of Local Taxation had begun to exercise an important bearing upon the administration of the relief, and created some discontent. And an Act 7th and 8th Vic., 101, sec. 74, gives its sanction to relaxation of out-door relief to widows *non resident*, an instance of the cautious approach to such things, which it is instructive to note. And there is a passage upon the question of medical attendance and appointments, which indicates something unsatisfactory in this direction (*vide* page 24, sec. 58). Under such circumstances we enter upon 1846. In this year one occurrence only seems to have disturbed the system, or put it under any extraordinary stress. The potato disease broke out. It was chiefly confined, however, to Devonshire and Somerset, and the distress was of a purely local character. It is somewhat remarkable to find that even this partial visitation led once more to a relaxation of the Prohibitory Order in certain unions, on this account. 1847 introduced some new features into the case, for the effect of the 9th and 10th Vic. to prevent removals was beginning to leave its mark. Let us see what was the first experience of this. At p. 8, sec. 16, we find it stated that the Removals Act of last Session has likewise increased the amount of relief to the Irish in the large towns, especially in the Metropolis. The report says: "By the operation of this Act, Irish and Scotch, who have been resident five years in an English parish, become irremovable from that parish; and thus many Irish, who had been resident for that period, became applicants for relief, although previously to the passing of that Act they had been deterred from applying from fear of being passed back to their own country. The expectations of benefit under this Act formed by the resident Irish in the Metropolis appear to have been excessive, and led to their applying in large numbers to several London parishes and unions at the beginning of the winter. Owing to the combined operation of the causes above stated, the pressure upon the poor-rates has been considerably increased since last autumn, and the Poor Law expenditure for the year ending Ladyday, 1847, will, when ascertained, be doubtless proved to have been greater than that for the preceding year." Notwithstanding the indications of these evil effects of such relaxation, and especially its incompatibility with an increasing tendency to out-door relief, no warning seems to have been taken, and another great barrier against national and unlocalised pauperism was broken down, beyond remedy or redress. Nay, even during the succeeding year, further facilities were afforded to abuse, and the following extract from the report of 1848, is most suggestive of what took place. At p. 11, section 39, it says: "The change introduced by the Poor's Removal Act of 1846 produced considerable disturbance in the charges for the relief of the poor in many places, but the temporary Act of 10th and 11th Vic., c. 110, which threw the relief of a certain class of the irremovable poor upon the common fund, removed much of the existing dissatisfaction." A further Act was therefore passed, 11th and 12th Vic., c. 110, making the charge a distinct one upon the common fund. The effect of this is obvious, and coupled with a continually increasing tendency to out-relief, will certainly not disappoint the admirers of a national system of pauperism, and a centralized administration. Still there are signs of trepidation even among official personages, and we find Mr. Lumley, before the Scotch Committee of 1870, speaking in this wise: "With regard to abolishing the law of removal, I am afraid it is a very serious question. I am very much alarmed at it in one sense, viz., that one of the best remaining tests of pauperism would be lost. If there was no power of removing persons who applied for relief, the test for destitution would be very weak indeed. The guardians would have almost to rely upon the vigilance of their relieving officers." And of this, he then supplies a very remarkable instance. But at this date such doubts did not afflict Poor Law reformers, and for some years to come we shall find that things went on in the same direction merrily enough. An increasing feeling against the harsher features of the law became observable, and soon other infringements of the first principles of localising relief were introduced. At p. 12 of this report it is conceded that the right to relief (that is, to live out of other people's work) is not restricted to area, and the Commissioners state, "The law relating to the

relief of the poor confers a right to relief, irrespective of settlement. All destitute persons have a right to be relieved at the cost of the parish in which they are. This right, in the first instance, is absolute." The qualification to this dogma is very slight, and we can scarcely wonder at the rush of Irish into Liverpool, upon such an announcement as this, nor that henceforth vagrancy increased. With this year, also we find an act conferring a grant towards medical relief, amounting to £61,500; and it is curious to find that, concomitantly with this concession, there was a diminution of the expense. Lastly, there occurred a notable change, for, under the 10th and 11th Vic., c. 109, sec. 9, the establishment of the Poor Law Board as a great Government office took place, and the President and Secretary took their seats upon the Treasury Bench. I need not recapitulate the arguments for this step—no doubt they are plausible enough—and that some advantages would accrue was obvious. And to some it may seem, that to throw a doubt upon the principle of Parliamentary responsibility, is to throw a doubt upon Parliamentary Government throughout. I shall risk this, and frankly state my doubts, whether such wisdom as Parliament possessed, was likely to prove an effective support or salutary check, or whether a constant succession of Parliamentary presidents and secretaries would supply in succession, the Cornwell Lewis's, George Nichols, and Edward Heads, of times past; whether so peculiar an institution could be harmlessly subjected to the popular voice, or become a counter in the great political game of ins and outs; whether the corrupting influences of political pressure is an advantage or not; and lastly, whether for the stable administration of the Commissioners, could be substituted a fitful, changeful, unstable authority, dependent upon ministerial tenure of office, remaining merely upon promotion, and chiefly anxious to avoid any administrative reform, which might lead, even temporarily during their ephemeral tenure of office, to an unfavourable balance-sheet. I know not what opinions others have formed—it is seldom that criticism extends to this—but, guided by the facts I am about to narrate, it seems to me that this change in the administration of the Poor Law was followed by deplorable results. It is true that during the following year the new Board could show a favourable return against those which immediately preceded, but it does not say much for the candour of such documents that we find the usual column showing the price of wheat omitted, and that it ranged from 30s. to 40s. per qr. during that remarkable period, which with the immense but transitory impulse given to manufacturing employments by the repeal of the corn duties, will fully account for the trifling reduction manifested. The figures shown were as follows:

1848	£6,180,764	
1849	5,792,963	£387,801 decrease.
1850	5,395,022	397,941
1851	4,962,704	432,318
1852	4,597,685	65,019

Decrease in 1852, as compared with 1848, £1,283,078.

It is melancholy to continue the history. During this year, under such favourable circumstances, the Poor Law Board wisely thought it expedient to issue more precise instructions concerning out-relief, which contained provisions of considerable stringency. Art. 1 provides that the relief shall be in kind, in certain definite proportions. Art. 2, that it shall be given or administered weekly. Art. 4 imposes a restriction upon relief to non-residents. Art. 6 enforces the work test, with some others of equal stringency, over which Art. 10 maintains the central supervision. Now it would seem that under the increasing laxity of practice, which had by this time become pretty general, these orders did not find favour with local administration; and on the 14th of December of the same year a circular letter refers to the remonstrances received from many quarters. In this letter the Board vindicates its conduct—referring to the original enactments, 4 and 5 Vic., c. 76, ss. 15 and 52; but, upon consideration, it consents to rescind Articles 1, 2, and 10 of that order, betraying the weakness of popular administration by the surrender of nearly all these important safeguards, while it condemns its own action by cogent arguments and conclusive reasoning. Clearly the effect of the political association is becoming apparent. With this, more amendments of the Law were associated. The 15 and 16th Vic., c. 14, continued the operation of the several Acts, which rendered the irremovable poor in Unions a charge upon the

common fund, for another year, and c. 18 continued the exemption of stock-in-trade from rateability to the poor for the same period. In 1853, the expenditure is once more increasing, but the cause is the increasing price of provisions. Wheat is 42s., increased expenditure £41,379. 1854 tells the tale more clearly. Wheat goes up to 61s. 9d., and £343,789 is added to expenditure. In this instance the report of the year does not forget the column, and it is duly noticed as a reason for the augmented charges. These are the tricks of the trade, and they may be passed by as such; we must, however, look beyond them for the real causes, which tell their tale in a progressive and steady rate of increase. And now, having arrived at this point, time warns me that I must pass more rapidly onwards through the history of the past. In the succeeding year under this form of administration we shall find, with occasional reactions and interruptions, a constantly retrograde tendency towards out-door-relief, accompanied with facilities which formed no part of the original Act. After this, 24th and 25th Vic., 1861, c. 55, shortening the term to three years; and subsequently 28th and 29th Vic., 1865, c. 8, which once reduced the term to one year. Concomitantly with this was widened the area of relief under successive acts, by 10th and 11th Vic., c. 110; 11th and 12th Vic., caps. 110, 111; 12th and 13th Vic., c. 103 s. 16; and 22 Vic., c. 29. By the 24 and 25 Vic., the period of three years was substituted for that of five, specified in 9th and 10th Vic.; and residence of any person in any part of the union has the same effect in reference to the provisions of the said section as residence in the parish. By 25th and 29th Vic., s. 17, one year was substituted for three, and the quoted figures will tell the rest. It is a tale of continuous increase from that point, viz., total amount expended to relief:

1855	£5,890,041	897,686
1856	6,004,244	917,084
1857	5,898,756	855,010
1858	5,878,542	908,886
1859	5,558,689	865,446
1860	5,454,964	844,633
1861	5,778,943	883,921
1862	6,017,525	917,142
1863	6,527,036	1,079,383
1864	6,423,383	1,014,978
1865	6,264,961	951,899
1866	6,439,517	916,152
1867	6,959,841	931,546
1868	7,498,061	992,640
1869	7,673,100	1,018,140
1870	7,644,307	1,032,800
1871	1,037,360

} Mean number of all classes at one time in receipt of relief.

Now during the greater period of this time this process went on either unobserved, or as a thing accounted for by the law of natural increase. It was scarcely a matter of sufficiently political importance to occupy the House. The great aggregation of such pauperism in the larger towns changed this, and in the metropolis it began to be recognised as a formidable fact. Towards the end of the last decade there were passed several important Acts, and the formation of district schools, asylums, and dispensaries for the Metropolis marks an increasing sense of requirements of a higher class. These, however, are local in their character, and partial in their effects, and must obviously be followed by measures of a more general and comprehensive sort, if they are to be attended with any beneficial results. We have nationalised pauperism, and we must deal with it as a national evil, deeply rooted, and widely spread. To some the possibility of this may be a matter of doubt, unless we are prepared simply to retrace our steps. It would be difficult, perhaps impossible, to do this, and in this case the alternative is clear—we must raise our organization to the level of its greater task, and make use of means, hitherto greatly neglected, towards its accomplishment. Emphatically I say, then, that one such of a value unsuspected is an efficient system of medical relief. Nor does this rest upon theory only, luckily it is capable of proof, and for an example of its operation we are able to turn to the history of Irish Poor Relief. I bid you mark the contrast. The Irish Poor Relief Act was passed on the 31st July, 1838, upon principles not greatly differing from that of the English Act of 1834, save in one important particular, which I would beg you to note, viz., the especial care which from the first seems to

have been bestowed upon its medical relief. Two causes, no doubt, tended to this. One, the great prevalence of fever in that country; and the other, some existing enactments, to which I shall presently advert. From that date up to 1844 there was little real experience of the working of the Act. At this time 98 Unions seem to have been formed—out of the 100 originally projected—and the houses rebuilt. At this time the first difficulties experienced seem to have cropped up. They arose upon the question of rates. In 21 Unions it was necessary to employ the police and military to collect the rate. Changes in the law took place, and in certain cases the owners were made the persons chargeable to rates—6 and 7 Vic., c. 92. The cost of establishment charges in Ireland, compared with England, is a striking feature in the case, as well as the far more complete organization of the Unions for in-door relief. The attention of the Commissioners in that country seems to have been called at an early period to the question of medical relief, and we find them anxious to enlist in the services of the Poor Laws, the valuable organizations which they found already at work. In 1805 we find that County Infirmaries had been set up, under 45 Geo. III., c. 3, and following upon this, in 1818, Fever Hospitals were established upon the county rates. In 1836 the Commissioners report that there were 31 County Infirmaries, and five City and Town, receiving aid from Government. Nevertheless, up to the date 1844, the system was not in close relation to poor relief. Under these circumstances the Irish Act started upon its course. Now, in the former instance I have given, I have spoken of the strain to which the English system was exposed through a period of depression to the working class; and I have traced its decadence from that point. It never wholly recovered from the laxity of principle then partially introduced. Let us see whether this applied to the present case. In 1846 the potato crop failed, and the distress then caused was neither partial nor temporary. It was a famine in its character, and a famine in extent; and it was in such a country that the law made property liable for the support of the poorer class. The collapse of the in-door test was complete, and the system became one of universal and gigantic out-door relief, under which three millions of persons were fed at their own homes at an expense of £1,557,212. During the succeeding years, up to 1848, fever and disease followed close upon the wake of this, and once more the system was exposed to the severest test. And now was found the great value of the organized medical force. To aid the County establishments the 10th and 11th of Victoria was passed, and practically the commencement of the Irish system of medical relief was set up. Upwards of 300 hospitals and dispensaries were provided under this Act, with accommodation for 23,000 patients. The expense was £119,055, which came out of rates. The weekly mortality increased from 4 in 1,000 in October, 1846, to 13 in January, 1847, 20 in February, 25 in April. So terrible a conflict between science and death scarcely ever took place, but it rose above the crisis at last. Nor was the lesson forgot, and its results were the permanent establishment of the dispensary system, under a Parliamentary Act, called the Medical Charities Act, 1851. And now comes the crucial test. Under what state do we find the Irish system, after so terrible an ordeal as this. The answer must be unanswerable figures:

	£	£
In 1852 there was expended	517,455 in-relief,	4,917 out-relief.
" 1853	6,030	4,920
" 1854	463,858	3,715
" 1855	432,824	4,702
" 1856	358,943	2,245
" 1857	292,085	2,412

Once more, take these figures as the proof: In England, in the year 1870, there were relieved of all classes, 156,800 in-door, and 876,000 out-door; or a total of 1,032,800, at an expense of £7,644,309, out of a population of 21,950,000. In Ireland, for the same year, the number relieved there were 230,429 in-doors, and 53,885 out; at an expense, including medical charities, of £798,138, out of a population of 5,516,674. The amount in the £ respectively being 1s. 2³/₄d. in Ireland against 1s. 5-9d. in England and Wales. No less remarkable are the statistics of diseases and death arising from zymotic complaints, a subject which Dr. Rogers will more properly deal with, together with a comparison of the relative

sums expended upon medical assistance, with which the comparison is complete. What conclusion shall we then draw from this? First, I think that the value of this great preventive service has never been fully recognized as yet. In this country it has been treated with absolute neglect, and what is the result? Let the 22nd report of the various classes of paupers, 1869-70, tell the tale of this, viz., at p. xviii., of adult able-bodied paupers, it speaks thus: "The whole of that large proportion of the pauperism of the country which is caused by temporary sickness is included in this class. If the sick pauper be the male head of a family, the whole family dependent upon him are included in this class." This number, in the returns for London, are given at 31.0 per cent. of the whole list, and for the whole country at about 30 per cent. What especial features do these two instances present. In the first we cannot fail to see that there has been a great and progressive deterioration from the original intentions of the Act, and that in this case each departure from principle was simply a prelude to the next. In the second we trace a situation almost precisely analogous, a strain of far greater intensity, a temporary but universal collapse, followed by a quick but permanent recovery, and a complete vindication of the principles upon which the Act was based. Why was this? Shall we be forcing the conclusion if we say that it was greatly due to the one exceptional advantage it possessed, namely, that of well-organised medical relief? One thing is sure, the value of this great preventive service has never in this country been fully recognised as yet, and this, too, against evidence of the clearest sort. In a recent speech, Sir Baldwin Leighton says, referring to the success of the Aetham Union, "Sanitary measures had much to do with the reduction of pauperism. Everything was done to prevent or stop epidemic diseases, and the bearing of this was that medical relief was more than half of out-relief." Mr. Atkins, vice-chairman of the Hackney Union, also said, "That the great reduction in the rates of that parish might be attributed to the increase of the number of relieving officers from two to eight; that whereas formerly they had one medical officer whose district was ten miles round at a salary of £65, they had now eight officers at salaries of £80. In 1867 they had 6,000 paupers; in half-a-year after the number went up to 16,000, the Union Chargeability Act having come into force." Now, what is the present state of our medical service? Dr. Rogers will be able to give you some instructive particulars on this point. Not only is it neglected and inefficient, but it has become a great and increasing abuse. Turn to the annual report of this year and see what is said, Mr. Peel, at p. 181, speaks of the diversity of practice and inefficiency of salaries to provide medicine, and recommends the establishment of dispensaries. Mr. Farnall's report, after stating that nearly 50 per cent. of the out-relief is given under so-called doctor's orders, says that a diversity of such treatment is simply at the discretion of the different medical men; that the supply of medicines is insufficient and bad, and he comes to the remarkable conclusion that it would be a pity to disturb so delightful a state of things. Mr. Cane is less insensible to the logic of his own report, and sums up the existing state of things thus: "The doctor's orders for meat and wine in effect transfer a large portion of out-door relief from responsible to irresponsible hands. They afford a minimum benefit at a maximum cost, afford constant opportunities for evading regulations directed against the grossest abuses—the relief in aid of wages—and hold out a strong and direct temptation to corrupt practices for private advantage." No words could convey a stronger condemnation than this of a miserable system, founded on inadequate remuneration, bad medicines extended to irregular districts and areas, and practices utterly incompatible with the working of the Act. Surely, then, we must either do away with altogether, or radically reform this service under the Act. Of that reform I will presently speak. First let me draw some conclusions from this review of the Poor Law since 1835. I think it will be seen that the strictures I first expressed are borne out, and that both in principle and practice we have widely departed from the original Act. Let me summarise the progressive steps. First, we allowed the gradual introduction of a general system of out-door relief. Then we de-localised relief under Removal Acts; next we weakened control and supervision by common funds and union rates—measures in themselves admissible under certain circumstances, but absolutely fatal to the operation of a Poor Law wholly dependent upon a repres-

sive test—local supervision and local taxation of a partial class. No doubt it was under a sense of the undue hardship of the Act upon the labouring classes that these amendments of the law took place, and something perhaps of the necessity imposed by the political association of which I spoke; but still more, I am inclined to think, from the neglect of remedies more efficacious, more humane, and under the circumstances more just, which deprived the administrators of the law of the moral support of those who saw the suffering, and recognized an unsupplied and often undeserved want. The theory of this law was repression, but the possibility of its enforcement depended upon conditions which its authors took no pains to find out—industrial conditions, social conditions, educational conditions. They cared nothing that the labouring classes possessed neither education, nor provident societies, nor medical clubs; that all the old enactments of Elizabeth to set apart waste lands, and to build cottages, had been set at naught; that the poor possessed no property beyond their hands, their daily work, and their daily wages—precarious enough, and in their uncertain tenure of such things, there could be but small inducement, even if the means existed, to save. For this helpless multitude it had nothing better to offer than the workhouse test. It assisted no providence, it instituted no industrial training, it starved its medical relief. What wonder that, deprived of sympathy, it was driven foot by foot into practices against which it was intended to protest. And now, gentlemen, comes the question, how are we to apply our remedies to this? In the instances I have mentioned we cannot go back; neither political nor social circumstances will permit us to do this. We have nationalized pauperism, and we have centralized administration, and let us boldly admit it. Upon these lines we must go forward, not back. Well, but some may say, how, and to what end? My answer must be: In making these changes in the law, we must become conscious that we have undertaken a great task. Superior organization can alone overtake and accomplish this. By this means alone we can restore a good deal which we have lost. The local information and knowledge possessed under the parochial system we must supply by paid officers thoroughly instructed in their duty, and competent to carry it out; and mind, I say a good deal when I say this. The liability for a fluctuating, unsettled population, must be met by a distinction in the application of out-door relief, guided by the circumstances of each case. To none, or few persons settled within the term of the original Act, should it be extended in any case. The administration of a common fund presents peculiar dangers, and temptations to abuse of a very grave sort. The discharge of workmen during unproductive seasons, rates in aid of wages, lax supervision, are not the least. It seems to me indeed scarcely compatible with out-door relief, and to entail upon us establishments of a different class—the Irish system in fact. We must thoroughly reorganize our medical relief system throughout, establish dispensaries, districts, sanitary and medical; and above all take care that the functions of the medical officers are precise and exact. His duty is medical. To the Dispensary Committee and the Board of Guardians belong the duty of relief. For persons too pauperized to afford themselves the necessary food, the infirmary within the house is the proper place. But also I call organized charity into this field as their proper place. Under the Dispensary Committee, their gift will seldom fall short or be misplaced. Education and industrial training require systematic efforts, not put forth as yet; and I shall call upon Dr. Rogers to satisfy you of the power of that scientific arm which we so strangely neglect. And lastly, in view of the great shortcomings of a highly centralized department—its incapacity to originate; its obstructive policy; its unwillingness to contribute from imperial sources; its subservience to political influence, and the obvious impossibility of strong government, in matters requiring the utmost tact and firmness and judgment—I am obliged to come to the conclusion that, here we are in need of an intermediate authority which would extend to common areas of administration and taxation. A county or its division, or one of our large boroughs would represent such a one. Through such an organisation the general system of relief throughout a district could be assimilated, while the general fund raised as a county or borough rate would be applicable to district schools, sanitary and medical inspections, and other general purposes, at present greatly beyond the scope of Union

administration. By such means we might, perhaps, attain a control over an evil, at all times great and menacing to society, but at present rendered doubly so, by its dangerous aggregation into our larger cities, and under ill-advised relaxations in the conditions of relief, which has assumed a truly national character. For this, I think, our remedy must be, more efficient and highly-organised local administration in every department, in which personal sympathy and well-directed charity will play their part.

Dr. J. ROGERS, President of the Poor Law Medical Officers' Association, who traced the history of the Poor Laws from the Commission in 1832-3, had been informed by two members of that Commission, Sir J. Kay Shuttleworth and Mr. C. P. Villiers, that although that Commission examined every conceivable cause bearing on the growth of pauperism, the sickness of the poor, as an element in its production, was not inquired into; in fact, its importance was entirely overlooked. It could not, therefore, be wondered at that the Poor Law Commissioners on the one hand, and the local Boards on the other, in making their arrangements for the relief of such sickness, should have adopted that course which appeared to them to be most economical—fixing the stipends of the medical officers at the lowest amount, and then advertising the appointments as open to all comers. Dr. Rogers traced the effect of this in the inefficient character of the medical relief afforded to the poor, and pointed out the evils that had resulted from it in the increase of pauperism. Dr. G. Wallis, who wrote 30 years ago, put the amount of pauperism amongst the working classes, which was traceable to sickness at 72 per cent.; Mr. Gathorne Hardy, in introducing the Metropolitan Amendment Act, at 50 per cent. His (Dr. Rogers') own inquiries led him to believe that Dr. Wallis's estimate was the nearest the truth. That it was very considerable was shown by the last report of the Poor Law Board, from which it appeared that from a total of 1,085,000 paupers, 4 per cent. only were adult males destitute from want of work, and that 30 per cent. of the in-door, and 13 per cent. of the out-door, were absolutely on the medical officers' books, these being wholly irrespective of the families dependent on them. Besides these there were vast numbers of people disabled by age or special infirmities, and of children, many being orphans. Passing to the stipends of the medical officers, he stated that they were fixed on no principle whatever; thus they varied from 8d. to 7s. in a case of sickness, the largest proportion, however, being below 3s., and that from an analysis of the expenditure on drugs for 60 metropolitan medical charities, it had been found that the average cost, of medicines only, amounted to 2s. 5½d. per case of sickness. It was therefore obvious that many of the pauper sick either went without medicine, or if they were prescribed for as they should be, it could only be at a pecuniary loss to the parish doctor. Passing to another point, equally important, if sufficient visits, and consequently proper attention, was paid to the sick, he found there was a general order of the Poor Law Board limiting the area of a district to 15,000 acres, and the population to 15,000 persons, and that as regards the area there were no less than 665 districts which exceeded 15,000 acres, and of this number 31 were above 30,000, 11 above 40,000, 12 above 50,000, 8 above 60,000, and 11 above 70,000; and in reference to population, there were 205 districts above 15,000 persons. Of this number, 15 exceed 30,000, 9 40,000, and even more than this. Similarly, there was an understanding that one district only should be held by a medical officer, but in reality there were 627 districts, which were held by 291 medical officers, whilst 266 medical officers nominally attended from 1,000 to 10,000 cases of disease annually; in fact, the Poor Law Board had never seriously attempted to interfere with local medical relief arrangements, though it must be evident that it had been reduced in such large districts and populations to a mockery. In fact, the principle had been that when a man was badly paid with one district of 15,000 acres, they gave him another, in order to enable him to keep a horse. Practical gentlemen, such as he saw around him, knew what ten, twenty, thirty, or forty thousand acres meant. He would ask them was it possible that a poor man, with a fever such as that which the Prince of Wales had, and which engaged the attention of three medical men, could be attended to by a medical man with such a district? Yet there were amongst the labouring classes scores of such cases. Dr. Rogers then spoke of the Irish system of Poor Law

medical relief. Some of those present could remember the horror that passed over the land when the terrible famine and fever took place in that country in 1848. Up to 1851 the system of medical relief in Ireland had been most unsatisfactory. In the fever of which he spoke the medical officers were swept away, and it became incumbent on the Government to adopt some system. He had yet to learn who they were that suggested the Act of Parliament, but the time would come when they would have all the merit of their sagacity and forethought. An Act was passed in 1851-52 called the Medical Charities' Act, for Ireland. By that Act the whole country was divided into dispensary districts, 719 in number, with 1,015 stations, some districts having two or more stations. At that date the total outlay for the poor in Ireland was £1,199,678, or 1s. 7d. in the pound, of which £54,289 was spent in medical relief. At the end of seven years the gross relief had fallen to £133,614, or 8½d. in the pound, medical relief having increased to nearly £100,000. Medical relief in Ireland did not make the recipient a pauper; and the result was that whilst in England there were 784,906 out-door poor and 157,749 in-door, there were only 50,257 out-door to 288,953 in-door poor in Ireland, the rate per head for out-door poor in England being £4 5s. per annum; in Ireland less than £1; in-door poor, England, £9 11s. 8d.; Ireland, £2 10s. 8d. In England the medical officers were compelled, by the poverty of their resources, to send many of the sick poor into the workhouses, thus converting those places into huge hospitals. The result of the working of the two systems was shown by the contrast of the Irish with English towns. In Belfast, where the population was 144,629—eighteen medical officers; cost of drugs, £1,508 6s. 3d.; salaries of medical officers, £2,397; gross relief, £25,009, with the conterminous Unions of Newcastle and Gateshead, where the population was 170,377—medical officers, 15; salaries, £1,212 (out of which they had to find drugs); gross expenditure, £60,500; also Cork—population, 147,572; twenty-two medical officers; drugs, £1,407 1s. 4d.; stipends of medical officers, £2,450; gross relief, £35,816, with Bristol and Clifton—160,714; medical officers eleven; salaries, £1,210; gross relief, £70,414. As to the rural Unions, he took Thomastown, in Kilkenny. Its population was 21,000; it spent £92 in drugs; £650 for salaries of medical officers; and £3,800 was the amount of the gross relief. Contrast that with Risbridge, in their own county. There the population was 17,000; nothing was spent for drugs; £374 was paid for salaries of medical officers, but this was made up by paying £10,000 in gross relief; or, just three times as much as in Thomastown. Again, contrast Lismore, in Tipperary, with Woodbridge. The population of Lismore was 20,000; its area, 97,000 acres; the cost of drugs, £111; salaries of medical officers, £795; gross relief, £3,600. The Woodbridge Union had 22,000 inhabitants; was 82,000 acres in area; nothing was spent for drugs; £549, salaries of medical officers; but the gross relief amounted to £10,000, or, just three times as much again as the Irish Union. Taking the population of England and Wales at 22,000,000 the cost of medical relief was £282,000; gross relief, £7,673,000; Scotland—population, 3,200,000; medical relief, £33,786; gross relief, £931,274; Ireland—population, 5,500,000; medical relief, £133,900; gross relief, £817,772—being for gross relief 6s. 11½d. per head in England, 6s. 0¾d. in Scotland, and 2s. 11¾d. in Ireland; and that medical relief constituted the twenty-seventh part of the gross outlay in England and Wales, and in Scotland, and one-sixth part in Ireland. Having ascertained so much from the Poor Law returns, he thought he would try it another way. He asked Mr. W. H. Smith, the member for Westminster, to get a certain return. If he had asked the Poor Law Board for that return, he would have been told that it could not be had. He asked for the estimated population of England, Wales, Scotland, and Ireland, the gross mortality in a series of years, and the mortality from preventable diseases. He dared say the clerks did not understand what it was wanted for; but it brought out the fact that while 1 in 43 of the population died yearly in England, 1 in 44 in Scotland, only 1 in 60 died in Ireland, and whilst zymotic or preventable deaths in England constituted one-fourth of the total mortality, and 1 in 190 of the population; Scotland one-fourth, and 1 in 194 of the population; in Ireland it was but one-fifth of the total mortality, and 1 in 308 of the population, and that the correspondence of general and zymotic mortality in Eng-

land and Scotland was evidently due to the same cause—deficient medical relief. They would observe that England and Scotland with equally faulty medical arrangements had a corresponding death rate, and that Ireland, which had an admirable system, had not only a lower death rate, but—what to the British ratepayer was perhaps of equal importance—a lower rate. This was not always the case. Up to 1852, fever was the opprobrium of the islands. Those who were old enough to remember the time when Irish labourers came to this country for harvest work, could remember that there was always a constant dread of their infecting a neighbourhood with fever. But all that had passed away, and why? Because of the wise provisions suggested by the wise heads of those who carried the Medical Charities Act through the House of Commons. But there was another point to which he wished to draw attention. Not only had fever been diminished, and diminished in such a remarkable degree that it had ceased to be the opprobrium of Ireland, but small-pox had also been so diminished that in the year before last there were only 20 cases in the whole five millions of Ireland. Small-pox did not produce one-fifth of the cases produced in England and Wales, because they had an efficient body of Irish Commissioners, who thought it their duty to look up cases of vaccination. The result had been a great diminution of that scourge of humanity. To show the importance of this matter he would tell them that there were 4,500,000 of the population of the labouring classes, and it was amongst them that the epidemic disease took its rise, and from them spread to other classes; it was amongst that class too that they had to look for their labourers, and whose children they had to keep during sickness and to keep till they grew up, if the head of the family died. It must therefore be obvious to them how important was the question of the sanitary condition of that class. He thought he had proved the necessity for an alteration, and that the suggestions he had to make should be carried out. Their excellent representative, Mr. Corrance, had taken a great deal of trouble, and had shown more than ordinary zeal with reference to the Association that he (Dr. Rogers) was connected with; and he was about to introduce in the House of Commons a scheme framed after the Irish Medical Charities Act. If that scheme should be carried into effect, he need not tell them that it would cause some additional outlay. He calculated this at £310,884 on medical officers' salaries; £128,000 for drugs and appliances, such as trusses; and £94,000 for the rent of dispensary buildings. The total of these amounts would reach to about £532,000, or an addition to what was now being paid of about £250,000. But if he had proved anything, he had proved that additional outlay for medical relief would be speedily recouped by a diminution of sickness, a diminution of the death-rate, and of other causes which produce pauperism. Dr. Rogers expressed his himself in favour of the removal of the burden from the rate-payers to the Consolidated Fund. He had long held that the rates for the relief of the poor should not be thrown upon a portion of the community. This was more especially true of sanitary measures, and for the following reasons, which he had tabulated, he held that the entire cost of medical relief should be thrown on the consolidated fund: 1. Because the incidence of local taxation was unequal and limited. 2. Because the character of modern pauperism was migratory, and had nearly ceased to be parochial. 3. Because sickness cannot be localised; for these epidemics which strike first and hardest the poorer classes, extend from them to those above them in the social scale, and were also liable to, and did spread over large tracts of country. 4. Because such epidemics, when occurring among the poor, were entitled to at least as much consideration as when occurring among cattle—and the ravages of cattle plague had been met by a rate thrown over a whole county—especially as the health of the poor, and their preservation from such epidemic outbreaks, was a subject in which the whole community was vitally interested. 5. Because illness among the poor in one part of the country required the same skill and outlay on medicines, to treat it successfully as in another. 6. Because the principle having been conceded of part payment from the Consolidated Fund, no valid objection could be advanced why the whole should not be thus paid. 7. Because local and often prejudiced opposition to necessary expenditure would be determined if the whole community contributed equally, upon a basis settled by some central authority. He concluded by saying that he had come down at the invitation of their worthy members to place his views before them. He hoped he had

made them sufficiently plain and had given them a sufficient outline to enable them to sit in judgment upon what he had said. If as the result of their examination they came to the conclusion that he was right, he hoped they would assist their hon. member in carrying out the scheme which it was his intention to introduce.

Mr. GOODWYN GOODWYN was not personally in a position to say whether the argument of Dr. Rogers was a good one, but the evidence he had brought was strong, and convinced him that there was a great deal in it. If they found nothing to say against it, they had best try to get the Irish system established.

Mr. JONES said his experience as a medical officer in the district was exceedingly slight, and he scarcely liked to give it. He could only express his entire concurrence with much of what Dr. Rogers had said, and hoped they might, with the assistance of their member, get something done. His district extended six miles straight out in one direction, and he was one of those fortunate, or unfortunate, people who had two. His second district extended five or six miles in another direction. For one of these, with five parishes, he had a salary of £65; in the other there were two parishes, and he had the munificent sum of £15 lss. for that.

The PRESIDENT: And find your own drugs?

Mr. JONES: And find my own drugs which I believe is generally the case throughout England. I am not saying this by way of complaint, but I am simply endeavouring to support what Dr. Rogers has advanced.

The PRESIDENT said he had mentioned one great abuse, the medical orders for meat and wine. He should like to have a practical opinion on that point. Would any guardian give an opinion as to the medical officers dispensing meat and wine, which had become a very common practice?

Mr. JONES said it was not the custom in his experience, for the medical officers to send the orders for meat and wine, but it was for meat. There was a printed form with a blank, and it was not the custom for guardians to give meat to a pauper, except by special recommendation of a medical man. When a man was ill, he would require something more than eighteen-pence a week, and a stone of flour. How was he to get anything in the shape of broth without meat being granted? They would of course say that was improper.

The PRESIDENT: I don't say that.

Mr. JONES said he was glad to find Mr. Corrance said it was not so. He had understood him to condemn the giving meat. He thought they ought only to find fault with the practice when the orders were given rather too freely.

The PRESIDENT said he had pointed out that the practice was liable to great abuse, and that such cases might best be met by charitable organisation. That would be far better than the indiscriminate way in which people now gave relief. That morning he had been asked to subscribe to a fund for the payment of a doctor's bill of £9 for a poor man. He asked if the man had belonged to a provident society and other questions, but he could get no satisfactory answers, and so declined to put his name to the paper. He should not object to subscribe to a charitable fund, and his intention was that people should go to such an organisation for medical relief.

Mr. JONES: You mean that a medical man should have a form placed in his hands, and give it to the man, and send him to the society?

The PRESIDENT: To the Dispensary Committee, and that Committee should furnish the order for meat and wine.

Mr. JONES: Then the difference would be that it would not come out of the rates?

The PRESIDENT: At any rate the rates should be supplemented from other sources. The sick man should go into the Infirmary or the House. My proposition would be the Infirmary or the House for such cases, in order to check abuse. The President, in reply to further questions from Mr. Jones, said he would have all cases of sickness removed to the Infirmary, if possible. He would relieve the doctor of the responsibility, and did not think he was the proper person to act as a relieving officer.

Mr. JEAFFRESON said it struck him that the medical officers were well qualified to supplement the relieving officers. They saw so much more of the cases than the relieving officers did. They wanted to leave rather more in the hands of the medical

officers. The statistics of Dr. Rogers were rather strong. He did not want to prove so much, and his case would have been better if he had not proved so much. He thought, too, that the difference in the character of the population had not been sufficiently shown. Half the advantage of the Irish system arose in his opinion from the more frequent visits of the doctor, which were a check upon abuses.

Dr. ROGERS said the figures were not of his own making. He had taken Belfast, a large manufacturing town in the north of Ireland, and had contrasted it with the towns of Gateshead and Newcastle; the city of Cork, again, with Bristol. In the latter, Dr. Budd had informed him, there actually had existed in 1856 a dispensary system, similar to that in Ireland. The Guardians of that day, in their penny-wise and pound-foolish system, thought that by diminishing medical relief the expenditure might be cut down and pauperism reduced. They therefore got rid of the dispensaries, and abolished the system of supplying drugs, and appointed three medical officers to look after the poor, at salaries £12 in advance of what it had cost them to supply drugs. In ten years the total cost of relieving the poor had gone up from £27,000 to £37,000, the population in the meantime remaining stationary. As to the difference in the character of the population in England and Ireland in the rural Unions, he did not think it very great. There was not a great difference between Suffolk and some parts of Ireland. Dr. Rogers also quoted the statement of Sir Baldwin Leighton, the chairman of the Ateham Union, that the great thing to be relied upon to keep down the rates was to look after the health of the poor. The expenditure of the Ateham Union had been cut down by that means. The Union was about equal to the Plumsgate, where the total expenditure was £8,500, but at Ateham it was only £4,300 a-year.

Mr. D. SMITH, jun., spoke warmly against the system of giving the sick-poor meat and wine. He felt, from his experience as a guardian for many years, that a better system of medical relief was greatly needed. The medical officers' orders for porter, beef, and mutton were what swelled the rates.

Mr. JEAFFRESON said, a great thing to prevent the necessity for such orders would be to pay the labourers 5s. more per week in wages.

The PRESIDENT, in summing up the debate, pointed out that the principles of the Poor-laws of 1834 had been departed from, and they must have something else in their place. They could not now go back to parish management and parochial chargeability. A better organization was needed, and one that Dr. Rogers had pointed out was a valuable one, but only one. But there was this difference between Ireland and England. Not only was the Irish system one of medical relief, but it was also one of in-door relief. But it was simply impossible to establish a system of purely in-door relief in this country. They must make up their minds to supply a poor man's most pressing wants, and Dr. Rogers told them that the most pressing want was in sickness. If a man could not get relief at that time he was disabled for life. Therefore, objectionable as most forms of relief were, they must have medical relief. It was one of the subjects where they would least expect abuse, as people did not like black doses, and it was hardly to be conceived that a man should sham illness to obtain only physic and to avoid work. They needed organized charity, and to make the dispensary system the beginning of an alteration of the Poor-laws. Out-door relief must be done away with in every case where it became abused, but in those cases where it could not be abused they must provide an adequate amount of out-door relief. The Poor-laws were open to great changes—probably great improvements—and he thought Dr. Rogers had proved to them that there was one such improvement that might be fairly sought.

Mr. GOODWYN-GOODWYN proposed a vote of thanks to Dr. Rogers.

Dr. ROGERS, in reply, said he had been engaged for ten or twelve years in the work of showing people that on the question of medical relief depended a large amount of pauperism. He had at first appealed to the benevolent men, but he found that in this country they were a feeble minority. Since that he had gone on another track—to the breeches pocket—and since that he had got no end of disciples. He believed, too, that the feeling was now rising in his favour, and he should soon get a great many more.

SHROPSHIRE CHAMBER OF AGRICULTURE.

LOCAL TAXATION.

At a meeting at Ellesmere, Mr. BOWEN JONES, vice-president of the Chamber in the chair, remarked that they had already had that subject before the Chamber on two occasions, and it had several times been referred to by speakers at the annual dinner and at their committee meetings. As they had been criticised by the press for bringing that question forward again, he thought it would be well to observe that there were good reasons why it now should not be lost sight of. The question had been fully discussed at Newport, where it was very ably introduced by Mr. Jasper More, on which occasion that gentleman called particular attention to the history, character, and incidence of the rates. And they discussed the question at Wellington last year, when the Rev. C. F. C. Pigott, their staunch champion on that subject, opened the debate. Still, there were good reasons why they should re-consider the question on the present occasion. On the previous occasions when they had discussed the question it was in its infancy; but now they had arrived at certain conclusions, and had enforced their views pretty freely upon the Government of the country. Last session they had two bills brought before them, but they did not meet their views as they ought to have done. It showed, however, that they had made an impression upon "the powers that be." They had the nail partly through the door, and he thought they ought to go on until they had driven it through and clenched it on the other side. He thought there were reasons why they should again open the question, and discuss it thoroughly. He would now call upon Sir Baldwin to open the subject; and he might say that they owed Sir Baldwin a debt of gratitude for coming down from London to attend that meeting.

Sir BALDWIN LEIGHTON said: At the request of a meeting of this Chamber, I have consented to attempt to introduce the subject of local taxation at this meeting—with some diffidence not only on account of the importance of the subject, and the presence here of men who have given more time to the question than I have, but still more because I am persuaded that the time has now arrived when the country party, the ratepayers, and those who agitate this question, must put forward a distinct demand—some counter proposition to Mr. Goschen's. We must show, too, that this is no mere matter of interest or class, not a mere breeches-pocket question, but a great matter of home policy, the unjust slacking of a great industry, that Government must attend to, or make way for those who will. We must show them that we can coin politics, as well as manufacture beef and corn. That is the responsibility that we must now assume. Now what is the position of this question? After some years' ventilation of the subject the long-suffering ratepayer has at length had his eyes opened to this state of things, which I cannot better describe than in the words of the Local Taxation Committee of the Central Chamber, signed Sir Massey Lopes. It says: "The tendency of legislation has hitherto been to throw upon the ratepayers various new charges for objects which, however good in themselves, have more a national than a local character. Chancellors of Exchequer have thus been enabled to take credit for budgets which by no means represent the actual taxation of the country, but by relieving imperial at the expense of local taxation give a very delusive impression of the actual amount of our national imposts." I don't think anyone can dispute those words; the thing has gone on till the burden of it has become intolerable, and the ratepayers have, through their representatives, at length said: "What charges are fair and just we are willing to pay, but what are unjust and national, we, a mere section of the nation, will not submit to; and meanwhile no more burdens, no more new taxes, till you have settled this matter for us." It was that determined position taken up by the ratepayers of this country that compelled our unwilling Government, after putting of the question for two years—remember they baffled us for two years with alternate threats and promises—compelled our unwilling and antagonistic Government to bring in a bill last year, in-

adequate in its scope and a mere juggle in some of its provisions, but a bill that did actually acknowledge the injustice by an offer of a sum of £1,000,000 a year—remember that sum—over 1,000,000 a year in the house tax. Thirty years ago Sir Robert Peel, that great modern minister whom the country party gave to the nation, declared, when Prime Minister, that the ratepayer was already overtaxed, and there certain charges, police and other, on the national exchequer; we have slumbered since then, but this I take it is in Parliament the position of the question: that no new unjust tax can be thrown now upon the ratepayer. Witness the treatment of the proposal to throw militia barracks on the counties. Our next step is to get rid of those charges, which are not justly to be borne by localities or by one-seventh of the income of the country. Then, as to the position of this question in this country, we have had, in the spring of this year, a discussion at Wellington, at which some very exhaustive speeches were made, and at which this resolution was passed: "That the present incidence of local taxation, falling as it does on one-seventh only of the income of the country, is unjust, and requires revision." I propose, to save time, to take that resolution and discussion as a basis or starting-point. It is printed, and in the hands of most members. I will only say this, that the speeches made on that occasion by Mr. Pigott and Mr. Bowen Jones, and others, must have done more to educate the minds of those that read them on this subject than any speeches in the House of Commons or any statements I have ever read. In those speeches the statements of Mr. Goschen—the inaccurate, dishonest statements, if I may venture to say so are demolished—and the report of the Central Chamber has still further exploded them; therefore we need not dwell on them further here except to say that after those speeches came Mr. Goschen's offer of £1,000,000 a year, together with a bill which was at once pronounced inadequate and withdrawn. That is the position of the question in this county and in Parliament. Now, before going further, I wish to mention two points which are, I think, important. First, I for one am, and I trust all in this room are, entirely opposed to any measure or change that will weaken local government. I look upon it as one of our most valued institutions, and I would sooner see it strengthened than weakened. Government, by centralization, is only fit for those who cannot govern themselves: it is the ruling of clerks and theorist of practical men, and quite unsuitable to the Anglo-Saxon nation. The fearful cataclysm that has overtaken France was a protest against centralization, for what truth there was in the Commune was a yearning for local government; and the passionate cry that comes to us from Ireland is that same protest, a gem of truth involved in wanton agitation; for what is home rule but local government? But I deny that the system of inspection and grant is one of centralization as at present administered. The magistrates of the county have full power over the good and criminals, as also prosecutors over their cases, although the central government pays for nearly all; and when they tried to overtax the costs the other day in Lancashire, the Lord Chief Justice administered a stern rebuke to her Majesty's Attorney-General which, I think, will prevent that recurrence. Then look at our schools; there are men in this room who have almost the whole management of our National and British Schools, half paid by Government; but the inspection and grant does not shackle or interfere with them—rather the contrary, I am told; it produces efficiency—and the same with the workhouses, where the Government pay less, but have more power; their authority then is attended with good effects, and the whole administration is in the hands of the local guardians. Therefore a Government grant, even when amounting to half, or more than half, the expense does not necessary interfere either with efficiency or administration. The second point is this: That it appears to me we must distinguish what charges or objects are local, what national, and what partly local and partly national; and also in what proportion,

otherwise we go up against this organized exchequer like a mob, strong in numbers, but indefinite of purpose, and weak in principle. And though I disagree with Mr. Goschen's policy and statement, I think he has some right on his side when he asks, "What is your specific demand? What do you call national charges, and what local?" I propose that we shall let him know; and to prevent any difference of opinion, let us give examples that cannot be questioned. Prosecutions, maintenance of convicts, and the expenses of militia, are examples of purely national charges—sewerage and bridges are, I think, examples of more local charges; but the greatest charge, that of the poor, is quite as much national as local—so are schools, police, and some other smaller expenses, such as vaccination and registration. These are acknowledged to be national by the Government grants, the only question being as to the proportion of each. Now, the subject I desire to call attention to chiefly to-day is the charge for the poor, amounting to £7,000,000, all of which nearly falls on the local ratepayers. What I am going to propose to you is the desirability of the Government paying *one-half of the charge for in-maintenance* including lunatic paupers, for the in-door poor must be acknowledged by everyone who has studied this subject to come under a different category to that of the out-door. The in-door poor are, to a certain extent, chronic and inevitable, besides being rather a stationary quantity. Even with the old Poor-law I find that the in-door poor were not much in excess of what we have now. Moreover, we have two precedents for this making of the in-door poor something else than a local charge; the application of the Protestant Church Endowment in Ireland, and the Metropolitan Poor Act, which charges the whole of the in-door poor on the thirty-six unions of London under what is known as the Common Fund. This is the resolution which I have drawn up for your consideration; it will be the second resolution to-day, the first being more formal: "That the semi-national character of such charges as primary schools, police, and maintenance of convicts, as well as the salaries of the medical and certain other officers, Poor-law officers being acknowledged by the Government contribution of about half of the expense, it is the opinion of this Chamber that the maintenance of the in-door poor, throughout the country, including lunatics and vagrants, as well as some other public expenses, is not a less national charge." Now, the cost of this charge, including lunatics, is £2,200,000. One half would be £1,100,000, and that appears to me not too much for the local taxpayer to throw upon the national exchequer. The amount in some of the unions in this county I have put down, to convey to you what this re-adjustment would amount to. The Government contribution under this proposal would be—in Ellesmere, about £80 per annum; Oswestry, £1,100; Whitechurch, £480; Drayton, £550; Wellington, £1,000; Aitcham, with Shrewsbury, £3,000; Shifnal, £270; Bridgnorth, £800; Clebury, £170; Madeley, £1,300. But there is another consideration of still greater importance which I desire to point out to you. There is at present in the Poor-law administration of many unions a certain very dangerous and ignorant policy of false economy. Out-relief is offered to applicants often quite inadequately, oftener still quite improperly, on the principle that it is more economical. Now, I maintain that the poor must not and cannot be treated on that principle. I cannot diverge here to explain to you that even as a matter of economy it is an unsound system; nor can I explain to you at length the statement which I must ask you to accept as a fact, that excessive out-relief is an excessive evil; degrading to the poor, intolerable to the collective ratepayers, and never contemplated by the framers of our Poor-law. Suffice it to say that all who have studied this subject agree in this view of the question. But if these things are so (and at the risk of seeming dogmatic I venture to tell you that they cannot be rebutted), a re-adjustment, which would at once relieve the over-taxed ratepayer, and indirectly improve the administration of the Poor-law, at the same time raising the poor, and still further lightening the shackles on industry, appears to me a re-adjustment that we can fairly demand, and ultimately must obtain. There are other smaller burdens that should also be re-adjusted, but for the present I beg of you to fix your attention on this, by far the greatest and heaviest and most important item of Poor-law relief. It is my firm belief that with such a re-adjustment as this, getting rid of the false economy argument, coupled

with such improved administration as I perceive signs of, the poor-rate of this country might be reduced at least one-half—for every two shillings you need only pay one—for every shilling you would only pay sixpence. But some will say, and amongst them certain ministers, financiers, and others, "Whence will you get your £1,000,000 per annum?" My answer to that is that it is not for the constituencies, nor for the ratepayers, nor even for the representatives, to find the mode of taxation. That is the special office of the Chancellor of the Exchequer; and if he cannot find it we must get another who will. But, curiously enough, we have just about that sum already to hand in the proposal of Mr. Goschen's to give us the house-tax. The house-tax, to which I called your attention before, amounted to just about a million a year. It would be applied generally, and not locally, as Mr. Goschen desired; but in so applying it we should only be following the precedents of Mr. Gladstone's policy in Ireland and in London in making the maintenance of the indoor poor something more than a local charge. Now, before concluding I wish to illustrate what I said just now about the "tendency of legislators to throw upon the local ratepayers charges for national objects," and to corroborate it by a little episode that occurred in Shropshire a few years ago. The Government of the day sent round to this county and others a suggestion or request that they should provide infantry barracks for the militia; whereupon it appeared to those who were charged with the care of the finances of the county that such a course was hardly legal. After some discussion it was determined to take counsel's opinion on the subject, and a barrister of high standing declared, "That the charge was quite illegal, and that the magistrates could not throw upon the ratepayer the expenses thereof." Armed with that opinion the magistrates went to the Government and stated their case; and what do you think was the answer? Why something to this effect: "O yes, we know it is quite illegal, but we have induced other counties to build them; they're not so sharp as you." Is that right? Is that just? Is that to be tolerated? For what do Governments take the long-suffering ratepayer of this country? Do they think he is like Issachar, a strong ass crouching between two burdens—the two burdens of local and national taxation? It would seem so. But they have already found that this county is not quite the ass they thought, and they may yet find that the united counties of England are stronger than they suppose. And now let me once more beg of you to look at this question from a higher standpoint than mere incidence of taxation or class interest. It is true that a great industry is shackled, almost crippled, in some districts, by the weight of what has been shown to be unjust taxation; but while we are knocking off the fetters from industries, let us also knock off the fetters from some of the industrial poor who are held down by a debased administration. Let us make this question the basis of a revolution in Poor-law administration and the inauguration of a new policy. Gentlemen, I have to propose, "That the present incidence of local taxation is unjust, that many of its objects are wholly national, and that the proposals of Mr. Goschen, formed upon erroneous and misleading statements, are wholly inadequate to rectify the injustice; neither will any measure which continues the exemption of personal property from contributing its fair share towards the general burdens be deemed satisfactory to this Chamber. That the semi-national character of such charges as primary schools, police, and maintenance of convicts, as well as the salaries of medical and other Poor-law officers, being acknowledged by the Government contributing about one-half of the expense, it is the opinion of this Chamber that the maintenance of the in-door poor throughout the county, including pauper lunatics, as well as some other expenses, are not a less national charge."

Captain Cress seconded the motion. He thought so far as the general taxation of the country went, they had no reason to complain or be dissatisfied, for the poor were exempt from the pressure of the income-tax, which fell upon the rich. But when they came to the question more particularly before them that day, he did not think there was the same cause for satisfaction. If any one were to examine the various items of expenditure charged to the county, they could not but be struck with this anomaly—that the owners of property certainly did pay a very large amount of taxation, which benefited a large portion of the community who bear no share whatever in the burdens. It was very desirable therefore that, if possible, the incidence of taxation should be made more equal, and that

they should get more assistance from the Imperial revenue. That principle of getting assistance from the Imperial revenue had been already recognised in various ways—by the assistance given by the Poor-law, by the allowances for the maintenance and conveyance of prisoners, and by one-fourth of the police expenses being paid. And why should not the principle be extended still further? Take the question of the maintenance of the militia. Some years ago, during the Crimean war, they were called upon to erect store-houses and quarters for the permanent staff of the militia; and at present there was a rumour that they were to be called upon to build barracks. And when he came to reflect upon an Act which was passed last session, which took away all patronage out of the hands of the lords-lieutenant, and which had for its object the assimilation of the militia with the army, he did think the entire expenses of the militia ought to fall upon the army estimates. And now with regard to the expense of prisons. In this country was not the protection of life and property an object of paramount interest to all? Were not manufacturers, merchants, and tradesmen interested in the matter, as well as the owners and occupiers of land and houses? How was it possible for a manufacturer's undertakings to be carried on unless he had security; and yet that class paid but a small share of the expenditure that was necessary for that purpose. He came, then, to the more important question of local taxation, as connected with Poor-law relief. He believed he would be found to be correct in his figures when he told them that the poor-rate is levied upon £101,000,000 of property, whereas the income-tax was levied upon £300,000,000 of property. And the latter sum did not include all of such property, for persons having less than £200 a year only paid as £110, and those having under £100 a year did not pay at all. But why should not all payers of income-tax bear their share of the poor-rate? Let them look back, and see what was the origin of the poor-rate in this country. Previous to the Reformation there were many monasteries and convents in the country; and with all their evils they abounded in charity, and the poor never looked to them in vain. Then came the reign of Henry VIII.; and he, at one fell swoop, swept them away, and the country was immediately found to be swarming with vagrants. All in that neighbourhood, he was sure, were well acquainted with the term able-bodied paupers; but their ancestors did not use the word—they called able-bodied beggars "sturdy beggars." The increase of sturdy beggars became so great a nuisance that Parliament had to put a stop to it. And Parliament was found to be equal to the occasion, for they passed an Act to this effect—that every sturdy beggar found prosecuting his avocation, for the first offence, should be flogged, and for the second offence he should be hanged. No sovereign that ever sat upon the throne of England administered the laws with more vigour than Henry, and he administered that law with such effect that upwards of 80,000 persons were put to death in his reign. That treatment had the effect of very greatly thinning the number of "sturdy beggars" throughout the country. But as time went on, in the reign of Elizabeth, sturdy beggars began to multiply again; and the wise statesmen who ruled the councils of that queen were endeavouring for many years to find out some system equally efficacious, but less severe than that adopted by Henry, to prevent it. It was in the forty-third year of that queen's reign that the famous Act of Parliament had passed which had come down to them in the present day. Daniel O'Connell used to say that there was no Act of Parliament ever passed that you could not drive a coach and six through; and there could be no doubt that the framers of that Act (43 Elizabeth) intended that every person should bear his share in the support of the poor. In the time of Elizabeth property consisted almost entirely of houses and land. There was very little personal property in the country. There was no national debt, no property in the Funds, no railway shares, and none of the many charming ways they had, at the present time, of investing money. The Act said "every inhabitant of every parish shall pay," and then it went on to enumerate the different classes of property that were liable—lands, houses, saleable underwoods, coal mines, &c. Well, here two slips were made; but if Acts of Parliament were made in a slovenly manner now, it was not surprising it should have been so then. If the Act had not mentioned coal mines in particular, all mines would have had to pay; but, unfortunately, the word *coal* was mentioned, and it had since been argued that all other mines

must be exempt, and exempt they had been. That was one inaccuracy. The next was in regard to the term underwood. As they knew, there was at present very little underwood in the country that was saleable. The profit derived from woods at present was from the timber and from the bark. But they could not call bark and timber saleable underwood, and so they could not tax them. Why should not the commercial, the mining, and the monied classes bear their fair share of Local Taxation with the owners of real property? He did not wish to set class against class, nor did he wish to throw off from real property any just burden that had been placed upon it, but he did think that all classes of property ought to pay a fair share towards the local burdens of the country. He hoped none would shrink from their responsibilities in that matter, but that, when the subject came to be discussed by the influential of the land, they would meet the subject in a fair and candid spirit, and whether their property be real or personal, he trusted they would do justice and get the burden laid fairly and equally upon all.

Mr. JEBB said he attended there that day with a great deal of pleasure, because he believed the discussion would be one in which no party politics would be introduced. He felt also that in all probability all of them would be able to agree with Sir Baldwin Leighton, who had kindly undertaken to introduce the subject, to whom their best thanks were due, the more emphatically so because he had handled that subject with so much candour and ability. It seemed to him (Mr. Jebb) that the whole subject lay in a very small compass. The Government, last session, admitted that a case had been made out for inquiry, and also, that it would be necessary to alter the existing law. Let them hope that, when the proper time arrived, it would be altered fairly and equitably. What they said was that houses and land, as regarded local taxation, are over-taxed, while personal property was under-taxed, and they therefore required, as was remarked by Captain Cust, a more equitable distribution of the burden. For instance, one man has £5,000 a-year in land, and upon that, for local purposes, he is heavily taxed, while another man in the same parish has £5,000 from the funds, and lives in a small house, say of £50 a-year rent; the second man pays nothing at all towards the local rates beyond the very trifling sum he pays upon his house. Take again the case of railways. Railway shareholders are liable to taxation for local purposes, but railway debenture holders escape scot-free. He might say, shortly, that in all this there was neither sense nor justice. When the poor-rates were first imposed upon this country, the great bulk of the property consisted, as Captain Cust had also pointed out, of lands and houses. He might remark, in passing, that real property was easily assessed, and easily taxed; and it had always come in for a large share of the burdens. Very much in the same way a farmer was in the habit of keeping a poor horse at home, and if an emergency came, he was always at hand to plough, or to harrow, or to do anything else that was required of him. In these days a great change has come over the country. There used to be little or nothing but real property. Now personal property was in excess. That being so, he would ask why should not a little of our excellent principle of free-trade be infused into local taxation—a little of that free-trade which embraced, now-a-days, almost everything, with the scandalous exception of the malt tax. Now, suppose for a moment that the manufacturers had occupied for the past twelve months the position that landlords and occupiers had filled with respect to local taxation. Did they think they would have been satisfied with it? Would not they have had many speeches up and down the country in all the large towns? Would there not have been agitation here, and there, and everywhere? Would not chambers of commerce have been moving in all directions? For his own part, he rejoiced that chambers of agriculture had followed in the wake of chambers of commerce, and he trusted that one effect of it would soon be the passing of a bill upon that important subject of local taxation. It was a subject, he was quite ready to admit, which was not without its complications and its difficulties; but that was no excuse for the postponement of legislation upon it. And he hoped if a bill was passed, it would not be passed hastily and slovenly, with loop-holes for coaches and six to drive through; but that it would be well considered throughout, so that when it is passed it will be a credit to Parliament, and the source of satisfaction to all classes in the community.

The Rev. C. F. C. PIGOTT said he thought the resolutions had been wisely drawn up, for one of them affirmed the general principle; while the other set forth a more special and particular part of the question they were discussing. They must, in the first place, keep steadily before the public their claim in full, viz., that income from every source should contribute to the Poor-rate. That claim stood on a very plain and simple basis—the self-evident justice and reason of the thing itself, viz., that charges which were national should be defrayed by the nation. This had been the intention of the legislature in the origin of the Poor-law, as was clear from the act of Elizabeth; and it had been reaffirmed by a most able committee of the House of Lords, after a full and careful examination of the whole subject. We might congratulate them on the progress the question had made during the last year. They had now eighty or ninety members of Parliament on the general committee; and in the division last February, in a very full House, the Government had only a majority of fifty-one over Sir Massey Lopes. Since that date the towns had shown signs of moving in the matter, especially the metropolitan boroughs; and if this movement went on, they would soon achieve success. The debate in February last had done much to educate the nation on the subject. Indeed it was especially a matter for the towns to take up, as houses paid a larger share than land in the common burden, as having a rating of something like £65,000,000 against £54,000,000. He hoped every effort would be made to prevent any final measure being carried next session, as a year or two more was needed before the public could take in the rights of the matter fully. It was especially a poor man's question, for the poor paid a very undue share; and the rates, moreover, were one main obstacle to the working man having a decent house over his head. Builders would not speculate in houses of this class, because they did not pay interest for their outlay; and it was of little use to educate the poor as long as they were crowded into dwellings unfit to ensure order and decency. He had listened to Sir Baldwyn's speech with great satisfaction; and from no quarter could what had been advanced come more appropriately than from one whose father was the greatest of local administrators, and who had taught them the invaluable lesson that they should wish to lessen paperism with all its miseries, without waiting for the time when its burden, or what was left of the burden, would be redistributed, and that on fairer and juster principles. It was far better to try and lessen the evil than merely to make your neighbour pay a fairer share of its cost. What they should keep mainly in view was to improve and elevate the condition of the working man, to help him to help himself, instead of increasing his dependence on others. He hoped they would always go home from these meetings with some practical end in view. As far as the rural unions were concerned they had the matter largely in their own hands. They should especially take care to put the ablest man they could find in the chair at their boards of guardians; they should encourage provident clubs, allotments, education; put a check on the public-houses, and administer charitable help on wise, and not unwise, principles, and then they would presently see an improvement in the evils complained of, which in their present state were a disgrace to a Christian country.

The CHAIRMAN said as there seemed to be no one else anxious to speak upon the question, he would put the resolutions that had been proposed to the meeting; but before doing so, he thought it would be well just to glance at the question from the point at which they had just arrived. At former discussions, not only in this country, but at the Central Chamber and throughout the country, he thought they had established a certain position. It would be seen that they had not looked back into the questions that day so much as they had looked forward, so as to see what they should do in the future; but he thought they might lay it down as a rule that it was recognised as an injustice that a large amount of the revenue of the country should be exempt from paying towards the

national burdens. That was one point that they had established. And they had established also the point that a large amount of the income derived from local taxation was abrogated to different purposes to that for which it was intended—that the income derived from local taxation was devoted to national purposes. They found from the returns of the Government that, although real property paid a good deal more towards local taxation than it ought to do, it did not pay so much towards imperial taxation as personality. Mr. Goschen's statistics showed that real property paid 14 per cent., against about 20 per cent. towards imperial taxation; but, on the other hand, they found that if imperial and local taxation were taken together, real property paid 33 per cent., and personal only 14, so that real property paid as two to one both to local and imperial taxation. Well, that point established, how could they alter the present state of things? Having referred to the solution of the question suggested by Sir Baldwyn, which he said was a fair and reasonable one, Mr. Jones said they must not lose sight of one thing—that they had got a certain amount of personality that was not assessed to the Poor-rate. Sir Baldwyn had told them one thing that had not been adverted to in the discussion that followed the opening speech. It was not only that they must look at the incidence of the rates to bring about an improvement, but they must endeavour to improve their position themselves. Sir Baldwyn told them that he believed that by better administration they could effect a very great saving in the rates, and if they had better administration, not only would they effect that saving, but they would at the same time be improving the social position of the poor, which is itself a very great consideration. Referring to the bill of last session, Mr. Jones said there were some points in it that were worthy of notice, and among them he mentioned the administrative portions of the bill, and the principle of parochial boards. These were principles he thought they had always advocated. Then there was the extension of the rate to descriptions of real property not now liable. There are certain exceptions at present—woods, metalliferous mines, &c.—which Mr. Goschen proposed to rate, and so to extend the area of rating upon real property. There was a very great objection, he thought, to one proposition of Mr. Goschen—the proposition for the division of the rates between landlord and tenant. He thought that was not calculated to do good in any way, for if the landlords were called upon to pay the rates, a readjustment would have to take place at the first opportunity, and he (Mr. Jones) believed it would have a discouraging effect upon agriculture; for although it might relieve the tenant from a portion of the rates, it would have a tendency to get landlords to work upon the rack-rent principle and discharge leaseholders. The encroachments that had been made upon the rates had been in general gradual. They had evidence of that with regard to the allowances granted from the Treasury for prosecutions. These costs had been removed from local to imperial taxation by Sir Robert Peel, but gradually disallowances had been creeping in, which were certainly not right in principle; but they had now become almost established in practice, and it was only a short time ago that an opposition took place of the part of a court of quarter sessions in one of the counties. He thought that was a subject worthy of the consideration on every quarter sessions in the county, and he hoped, at the next meeting of the magistrates for that county, the matter would be brought forward. Before he concluded, he would ask them to thank Sir Baldwyn for his admirable address.

Capt. CUST seconded the vote of thanks to Sir Baldwyn. The name of Leighton was, he said, honoured and respected, and the name of the late Sir Baldwyn would, for the great services he rendered to the county, long be remembered by them.

Sir BALDWIN LEIGHTON having replied,

Mr. STANLEY LEIGHTON proposed a vote of thanks to Mr. B. Jones for the very business-like manner in which he had conducted the debate, and the valuable aid he rendered the Chamber at all times; and this was also carried.

LOCAL TAXATION.

At the dinner of the Blandford Agricultural Society the Rev. Prebendary FARQUHARSON said he was more and more convinced that what they required in these days was unity of action; it was necessary that they should get rid of

their divisions; he wished he could say their religious divisions as well as their secular. He would say a few words with the view of showing them that he sympathised with them in one respect very much indeed, namely, in the amount of rates

for one purpose and another which they had to pay. He did think that the time had come when the area of assessment should be enlarged, and when other classes of the people should be called upon to support gaols, police, and lunatic asylums in an equal degree with the occupiers of land. He could not exactly see the justice of a person who derived a benefit from property being allowed to escape from paying his fair share towards the maintenance of those institutions from which he was deriving the same benefit as his neighbours who were occupying land or houses, simply because he had shut himself up in some lodging or other. For instance, that party considered that the weights of his grocer were unjust. He accordingly gave information to the police, and the police tested them and compelled them being made just. He thus received a benefit from the police. In another case he went to the relieving officer and told him that a certain person was a lunatic and ought to be taken to a lunatic asylum, but not at his expense; no, at the expense of the ratepayers! He thought the public mind was becoming awakened to the fact that common charges ought to be more widely borne, and that they who were connected with the land should be relieved of their burdens to some degree by a portion of the money which they at present paid in rates being obtained from other sources. He trusted their representatives in Parliament would bear that in mind in the next session. Mr. Fowler, who took a great interest in those matters, had informed him that as many as eighty members of Parliament had given their adhesion to the view of the question which he, in common with many other agriculturists, entertained, and that there was now a large and united body who would do their utmost to ensure justice where they thought it was so much needed. He had made those few remarks upon the subject for the purpose of opening it to the meeting, and he had no doubt Mr. Portman would be very glad that he had done so because it would be something fresh for him to speak upon.

Mr. MANSEL-PLEYDELL, the Chairman, said, as far as he had studied that question, he believed the great help that local taxation would give to the country would be much more in favour of the landlord than the tenant.

The Hon. W. H. B. PORTMAN, M.P., said: I have very little doubt that before this time next year the ballot will have become the law of the land. I have never been a supporter of the ballot; I have voted against it; but at the same time I am bound to say that two or three things which occurred last autumn have very much staggered my opposition to it. I will give you two instances. At the time of the strikes at Newcastle, the working engineers wished to express their opinions by ballot, but this was objected to by the leaders of the movement, because they did not think they could trust their followers to go with them to all lengths, and to submit to all the privations which they themselves were prepared to undergo. In the other case, the hand employed by a large firm struck for nine hours' work. There were 40 of them, and the question was put to the ballot amongst themselves. Well, 30 of them were found to have voted for 10 hours, and only the remaining ten for nine. My own impression is this, that if we do have the ballot; if voting at elections is to be carried on in secret, we ought to go a step further and allow members of the House of Commons to vote in the same way. I tell you honestly that I have always been opposed to the ballot, and I cannot cheerfully vote for it. I do not like the principle, and I think we had better continue to conduct our elections as they have been conducted hitherto. I now come to the subject which Mr. Farquharson has suggested. I have a few statistics here which I have extracted from a report by Mr. Goschen, the late President of the Poor-law Board. They are very curious figures, and I dare say Mr. Fowler knows them already, but perhaps some of you do not. Well, the average amount of rates of all kinds paid in Dorset is just a half-penny in the £ above the average of England and Wales. You know that, don't you, Mr. Fowler? In 1865 we heard a great deal about County Financial Boards, and in that year Boards of Guardians were responsible for an expenditure in round numbers of £10,000,000 of money. In the same year magistrates and county treasurers were only responsible for an expenditure of £2,300,000. Then there is another curious fact, that the aggregate local expenditure of England and Wales in that year was somewhat beyond the receipts. Of the money raised, 43 per cent. was spent in town districts, 15 per cent. in rural districts, 31 per cent. in mixed

districts, and 8 per cent. in other ways. There can be no doubt that of the many branches of expenditure chargeable on the county rate, some have of late years materially increased; but at the same time the Consolidated Fund does more for us than it did. The relief of the poor, for instance, has much increased. In round numbers there has been an increase of £8,000,000 in local burdens. Of these £8,000,000 £2,000,000 of Poor-law expenditure are charged partly to urban and partly to rural rates, £5,000,000 to town rates, £500,000 to county police rates, and the remaining £500,000 to highway and county rates, mostly rural. Mr. Goschen's report also contains some curious figures in reference to the proportionate value of lands and houses. In 1814 the total annual value of the lands in this country was £37,063,000; of houses, £14,895,000. In 1843 lands had risen to £42,128,000; houses to £35,556,000. In 1868 lands had risen to £47,767,000; houses to £68,013,000. The value of land, therefore, has been far outstripped by that of other kinds of property. Taxation on land has not increased in a greater proportion than the value of land, but the poor-rates have increased between 1838 and 1868 about £2,000,000, while the share borne by the land has decreased to about the same amount. There is another point. Mr. Goschen got reports from foreign countries as to the relative proportion of taxation borne by the land. The results are these: In 1878, in the United Kingdom, land paid five per cent. of the imperial taxation; in France, 18 per cent.; in Prussia, 11 per cent.; in Belgium, 20 per cent.; in Holland, 8 per cent.; in Russia, 11 per cent.; in Austria, 17 per cent.; and in Hungary, 32 per cent. No doubt we shall hear something on this subject from Mr. Fowler. I will, therefore, read an extract from the concluding portion of Mr. Goschen's report to the Government. His words are these: "The increase in local taxation in England and Wales has no doubt been very great—less than in other countries—but large enough to justify the especial attention which it has aroused. The greater proportion of the increase, however, has fallen on urban and not on rural districts." Mr. Farquharson says there is no reason why personal property should not pay a portion of those rates, but the difficulty is how to it? If Mr. Fowler can elucidate the point I shall be glad to assist in furthering his views.

Mr. ROBERT FOWLER (Whitechurch) said, as to local taxation, the scent appeared to be drawn from the real question at issue. To-day Mr. Portman had made it appear as if the question was between lands and houses. But that was not the question, for lands and houses were both real property; the issue was rather between real and personal property. Mr. Portman would perhaps excuse him, but he knew as well as he (Mr. Fowler) did that that was the great point at issue. Fifty years ago the amount of real property in this country was represented to be between 70 and 80 per cent. of the whole property of the nation; but what was the present proportion? Why real property was now only 29 per cent.; thus 71 per cent. was personal property. Such had been the great change that had taken place within the last fifty years. Was he to be told that this change was not a great loss, that the great local taxation representing £20,000,000 should not be brought to bear upon personal as well as real property—was £20,000,000 to be raised upon 29 per cent. of the national property, while 71 per cent. passed scot free? Had now the owners of the latter the advantage of the country's laws equally with the owners of the former? Was this justice? Could it for one moment be supposed that the owners of real property would sit quiet and allow this state of things to continue as it had so long existed? They would remember that last year the Government thought proper to bring in a measure which was called the Local Taxation Bill. Directly he had read it he said, "This is a bill to remove the good feeling which now exists between landlords and tenants. It can have nothing to do with the question before the country; if this bill should pass it cannot in any way touch that question."

The Hon. W. H. B. PORTMAN, said, respecting the great question in which Mr. Fowler took so much interest, it should be remembered that if towards the local rates you got more assistance from the Consolidated Fund you would have less control over them. Mr. Fowler was quite right in pressing the importance of the relations between real and personal property. It was a question which would perhaps take some years to finally settle; but it must some day be tackled, and he hoped a good result would issue.

THE PROHIBITION AGAINST "ROYAL" SHOW STOCK.

At the annual meeting of the Staffordshire Agricultural Society, Lord Hatherton in the chair, the Report stated that a resolution will be submitted to this meeting to alter Rule 19, the effect of which alteration will be to exclude from exhibitions of this society stock which has been shown in the same year at the meeting of the Royal Agricultural Society. The committee would point out that there is sometimes this disadvantage attending the present arrangement, that when members of this society are known to have animals prepared for exhibition at the Royal Agricultural Show, it may deter others from bringing stock in ordinary condition to the show of this society, which it desires to see more generally done. On the other hand, the Society is anxious that the best stock should be shown at its meetings, and this the proposed change in the rule might perhaps have the effect of prohibiting.

The CHAIRMAN: There was one question to be brought forward on which they should be glad to hear what there was to be said, viz., a resolution to prohibit animals which had competed at the show of the Royal Agricultural Society from competing at the meeting of this society in the same year. He was quite certain that Mr. Masfen would not have given notice of that resolution without strong reasons, for, as the report stated, if carried, it would probably be the means of preventing some of the finest animals, which they must all have great pleasure in seeing, from being exhibited at the county shows, but at the same time there was no doubt that the knowledge that animals which had been exhibited at the Royal Society's show would come to the show of this society tended to prevent members from sending good class animals, knowing that animals which had been at the Royal show would be sure to supersede theirs. Well, as this society wanted not only quality but quantity, it might be a great advantage to alter the rule as Mr. Masfen proposed, but they should be glad to hear what was to be said on the question, for and against.

Mr. MASFEN moved that Rule 19 stand as follows: "Rule 19.—All stock (except stallions) qualified to exhibit shall be bona fide the property of the exhibitor at the time of entry; and shall have been in his possession three months at least previous to the exhibition, except rams, which nevertheless must be equally the bona fide property of the exhibitor, and shall not have been exhibited at the meeting of the Royal Agricultural Society in the same year." He said the Report stated the reasons for and against the alteration of the rule. His object in proposing the alteration was not to curtail the number of exhibits at the Society's show, but very much to increase them. He had come to the conclusion, from his own observation, having attended a great number of local shows in different parts of the kingdom during the past ten years, that very few of the exhibitors at the Royal show followed up their venture at the district shows without very much injuring those shows in point of merit and numbers. It frequently happened that if a man had competed at a Royal show he sent his stock not only to the county show but also to many of the shows in different parts of the country, and he (Mr. Masfen) had learned that in local shows where there had been a good entry there was no certainty of many of the animals coming to the show owing to the fact that after the entry had been made it had been found that animals which had been exhibited at the Royal Agricultural Society's Exhibition were about to compete. It practically amounted to this: that where an animal that had gained distinction at a great show was to be exhibited at a local show, a farmer pure and simple had to compete for the second prize only, the first prize being certain to go to the animal that had been specially prepared for exhibition. It was not intended that local shows should give encouragement to that extreme preparation of stock which it was necessary animals should undergo to have any chance of success at a Royal Agricultural Show, nor was it to the interest of the tenant farmer to prepare his stock in that way generally; therefore, it was quite natural for a farmer to say, when he knew that Mr. So-and-So was going to exhibit a sheep, bull, or heifer at a local show, which had just before appeared at the Royal Agricultural Society's Show—it was natural he should

say, "It is no use me competing, because I am, in fact, out of the competition, except for the second prize, and it is not worth the expense of sending my animals across the country to compete for the second prize." And it was not only the money that was of consideration, but many men who thought nothing of getting a second prize thought a good deal of getting a first. Having been a judge himself, he knew many instances where animals had been brought to such a condition by unnatural feeding to fit them for shows as to render them of no value at all for propagating their species, yet the rule as it at present stood not only encouraged preparation of animals for show, which preparation unfitted them for breeding purposes, but did an injustice to tenant-farmers by practically preventing them from exhibiting animals of a very much more useful class than those which were fed for show. He did not wish to exclude these animals from the local shows in succeeding years, but only in the years in which they had been prepared for the great shows, for in after years they would compete on much the same terms as other animals.

The Rev. E. C. PERRY seconded the resolution. He said it was a subject upon which he had thought a good deal. Whatever tended to prevent the great majority of farmers of the county coming forward to compete at the county shows must tend materially to lessen that interest in the shows which those connected with the Society wished to encourage. The standard of feeding to which animals must attain before their owners could hope for success in a competition at the Royal Agricultural Show was such as almost to preclude the possibility of the animals being of any great service for breeding purposes at later periods. He thought Mr. Masfen had so fully shown the advantages that would accrue from an alteration of the rule that most, if not all of those present, must see that the interests of the Society would be promoted by the change.

Mr. CAREINGTON suggested that the rule, with Mr. Masfen's idea embodied therein, would be more clear if it stood as follows: "All stock (except rams) qualified to exhibit shall be bona fide the property of the exhibitor at the time of entry, and shall have been in his possession three months at least previous to the exhibition. All stock (except stallions) that has been exhibited at the meeting of the Royal Agricultural Society in the same year shall be ineligible for competition."

Mr. MASFEN adopted the alteration.

Mr. TIMMS said it was a weak piece of business to cut at men who had shown at Royal exhibitions, for there were farmers who could show successfully against winners at the Royal, where there was the worst judging that could possibly be done.

Mr. WALKER said that if the show of the county society had been open to all England then he could have concurred in the alteration proposed, but he could not agree with it under present circumstances. Perhaps he might be classed as "one of those travelling exhibitors," but he thought it was hard to exclude a farmer in the county from competing at the county show with the best stock he had. This stock was produced at great expense; and every one had an equal chance of producing it. If the alteration were made it would put him, as an exhibitor of pigs at the Royal shows, to great expense, if he were also to compete at the county shows.

Mr. COXON remarked that he also might be considered as "one of the travelling exhibitors" spoken of by Mr. Walker, but he entirely agreed with the observation of Mr. Masfen. He had been for many years an exhibitor at both the Royal and county shows, but the exclusion of Royal show competitors from the county shows would tend so much to increase the competition among tenant farmers at the latter, that he felt that if he wished to compete at the Royal as well as the county shows he ought not to object to send different animals to the latter from what he sent to the former.

Mr. WALKER said the ease of sheep-breeders who held annual sales was very different from the ease of owners of cow stock or pigs. A sheep-breeder had a whole flock to fly to, but he, as a pig-breeder, had not the same advantage.

The motion was then put and carried.

THE BREEDING OF CATTLE.

Mr. T. F. JAMIESON, Lecturer on Agriculture in the University of Aberdeen, has recently delivered the following lecture "On some Points connected with the Breeding of Cattle."

Many people must have observed with some degree of surprise the prices given at certain sales of live stock during the past few years. When heifers sell for a thousand guineas and bull-calves at a like figure, we naturally ask what peculiarity there is about the animals to excite so keen a competition. To the uninitiated many of them seem no better than might be picked up in a market at a very moderate price; but it is evident there must be some hidden virtue, real or supposed, that acts as a charm on their admirers. Lords and commoners, assemble round the ring, and the bids rise rapidly by fifty guineas at a time, and men come from America and far Australia to secure some of the lots. On inquiry, we are told it is *Bates' blood*, or, it may be, *Booth's* that constitutes the charm or perhaps the animals are of the Duchess or Oxford tribe; that it is not so much the beasts themselves as their pedigree that is the attraction. The competitors are anxious, eager men, and

Their expression is so solemn, and so earnest is their tone, that nought would seem worth living for but 'red and white and roan'.

The white bull-calf just knocked out at a thousand guineas is entitled "Duke of Oxford the 20th," and its lineage running through many a far-famed sire is recorded in the catalogue for ever so many generations. And who is Bates? the stranger may ask, and what is the Duchess blood that it should be so famous? As the breeding of cattle has become a sort of science, and is regulated by laws or conditions which seem to apply not only to the animal kingdom but also to the human race itself, the subject is one of considerable interest, not only in regard to agriculture, but also on account of its relations to biology at large. The record of facts connected with the breeding of our domestic animals, which has been now accumulating for many years, may be studied with advantage even by those who have no special interest in the pursuit itself. There is every reason to believe that pedigree is of importance in regard to the mental faculties as well as to the bodily features and constitution, and the progress of investigation leads us to suppose that every peculiarity of mind and body may be inherited. Some even hint that there is such a thing as hereditary brains, and pedigree tells in a Hohenzollern as well as in a Shorthorn. No one paid more attention to pedigree than Thos. Bates, who brought the Duchess tribe of Shorthorns first into public notice. He was a native of Northumberland, born in 1775, and sprung from a family which had long been resident in that county. Being in easy circumstances, and owner of some landed property, he was able to devote his attention to the rearing of cattle under very favourable circumstances. He had also the advantage of a tolerably good education, having at one time intended entering the Church. He was well acquainted with Charles and Robert Colling, although considerably younger than either of them, and knew a good deal about both their herds. The northern counties of England seem to have possessed a good kind of cattle for a considerable period, owing apparently to the natives of the region having a taste that way, and it is evident many excellent herds existed before Charles Colling began to devote his attention to the subject. Early in the last century, we learn that several of the landed gentry in Northumberland prided themselves in the excellence of their cattle. The Smithsons of Stanwick were among these, and Sir Hugh Smithson, who married the heiress of the noble house of Percy, used to weigh his cattle periodically, as well as the food they ate, so as to ascertain the amount of improvement made in proportion to the food they consumed—the first authentic instance we hear of this being done; and it is from his stock that Bates' Duchess tribe are supposed to have originally descended. The Studley family had also long been famous for the excellence of their shorthorned cattle, and the Blacketts

at Newby, near Ripon, had their entrance hall, we are told, hung with portraits of their more celebrated animals. In addition to this native stock, we find that a Mr. Michael Dobinson, early in the 18th century, brought over some very superior cattle from Holland, which were of material service in improving the breed of Shorthorns in the north of England, and Sir Wm. St. Quintin also imported others from the same quarter. It is clear then that Colling had good materials to select from, and, in fact, Bates seems to think the Shorthorns were at their best about 1770, and alleges that both Robert and Charles Colling repeatedly admitted to him that the Shorthorns were better before they came into their hands than when they had them. This perhaps may be true in regard to their milking properties, for some of the early Shorthorns, as I shall afterwards have occasion to show, seem to have far excelled their modern representatives in this respect, and Bates laid much stress upon the yield of milk, but in other respects, as flesh producers, the breed, instead of falling off, is generally considered to have much improved. For example, George Culley, writing in 1786, says—"Within a few years, a very rapid improvement has taken place in the breeding of short-horned cattle, so that in a few years, I have reason to think, they will surpass their rivals the Longhorns." No doubt this improvement to which he refers was that carried out by Charles Colling. It is to be regretted that accurate data do not exist for enabling us to compare the animals of the present day with those which existed in the last century, or even fifty years ago. And we occasionally hear some judges and practical breeders, like Mr. Sanday, asserting that the animals bred at the present day are inferior both in size and quality to those of former times. We want for comparison, the elements of weight and measure, and have to depend merely upon hearsay and matter of opinion. If correct measurements were recorded of the size of the animals at certain periods of their age, we could at once tell whether those we now produce were equal in magnitude and rate of growth to the races of a former generation. The fineness of bone could also be a subject of accurate measurement. At our national shows there should be committees appointed for the purpose accurately measuring and noting the features and qualities of the finest animals in the various classes, and let a record of the particulars be inserted in the journals of the societies. If something of this kind were done, we should know what progress takes place, whereas, by the present system, no certain data are established, and we can't tell whether our breeds are improving or falling off. From the fossil remains of oxen, got in the more recent geological deposits, naturalists are of opinion that at least two species existed in this country before it was inhabited by civilized man. One, a very large kind of ox, called the *Urus*, whose remains are sometimes got in the marl-beds and peat mosses of this country, and Julius Caesar mentions it as occurring in a wild state in the forests of Germany in his day. It seems probable that the Shorthorns and some of the other large breeds, such as the Hereford, are descended from this great wild ox. It is believed to have been domesticated in Switzerland at a very early period, and Lord Tankerville's cattle at Chillingham Park, in Northumberland, are thought by some to be descendants of this species, although much degenerated in size. These half-wild cattle at Chillingham Park are white, with the inside of the ears reddish brown, the eyes rimmed with black, muzzle brown, hoofs black, and the horns white tipped with black. According to some old Scottish historians, the wild cattle of the Caledonian forests were white, and furnished with a great mane. Perhaps this may partly account for the great tendency of white to appear in the short horned breed, notwithstanding the desire of breeders to avoid it. Many of the best early herds of Shorthorns near Ketton were white, with red ears and red spots on their necks, and it used to be remarked that there was a great tendency to white in all those that were bred from closely related blood. The other species of wild ox (called *Bastouffrons* by Pro-

fessor Owen), was of a much smaller size, had a short body and fine legs, and is believed by Mr. Dawkins, to have been domesticated in England at the time the Romans occupied it, and to have supplied food to their legions. Owen supposes that the small Highland and Welsh cattle are derived from this species. Nothing certain is known as to its original colour. From the magnitude of the skeletons of the larger species of fossil ox, it would seem that the great size of our Shorthorn and Hereford cattle, is not a feature we owe to the progress of modern improvement, but is an ancient characteristic of the breed. The main object for which we keep cattle is the production of beef and milk, and the most valuable breeds are those which best fulfil that object. A doubt exists as to the possibility of combining in great perfection both of these qualities. Some advise that we should have separate breeds adapted for each purpose; one for the dairy, and the other for the production of butcher's meat; and that it is a mistake to think of getting both advantages united to any great degree in the same animal. Such was the opinion, for example, of George Culley, who thought that where this is attempted we are likely to get neither in perfection: in proportion as we gain the one, we lose the other; the more milk, the less beef; the more beef the less butter. "I am inclined," he says, "to think you cannot unite great milkers with quick feeders. They are two different types of cattle, adapted for different purposes, and we should make our selection according to the particular object we have in view. If we want dairy produce, let us select both bulls and cows from the best milking tribes we can find, and keep to that sort exclusively; breeding on both sides from the families most remarkable for the production of milk, and in due time we shall attain our object. On the other hand, if we want feeding or grazing cattle for the production of butcher's meat, let us select the quickest feeders wherever they can be found; but let us keep to distinct sorts and don't mix them, for by attempting to unite the two we shall probably spoil both." And Culley points out that the two sorts belong to different types of cattle. "The great milkers are lean-backed, flat-sided, big-bellied, poor, and ill-looking, although kept on good fare. Whereas the other are thick-set, broad-chested, round, and barrel-shaped beasts, light in the paunch, and well-covered on all their points. I have quoted Culley's opinion because he was considered a very good judge, and a high authority in his day. Although contemporary with Charles Colling, he was an older man by sixteen years, being born in 1734. He published his essay on live stock in 1786, so that his remarks were made before the improved Shorthorns came much into notice. Culley was a pupil of Bakewell, who is said to have had a special liking for him, and often took him along in his tours to examine the various breeds of live stock throughout the kingdom; so that he came to be considered Bakewell's favourite disciple; and Robert Colling used to say that whatever he knew of the art of breeding cattle he owed to George Culley. There is no doubt a great number of the high-bred cattle of the present day are very deficient in milking properties. This is especially the case with those exhibited at our cattle shows, not only among the Shorthorns, but also in the Herefords, Devons, Polled Aberdeenshires, West Highlanders, and Galloways, which would seem to corroborate the opinion of Culley, that the farther we go in improving a breed for the production of beef, the more we spoil it for the dairy. Some, however, dispute the accuracy of this opinion, and maintain the possibility of uniting both advantages in the same race. Thomas Bates was one of these, and as he had a very long experience as a breeder, and is an oracle on the subject, his opinion is entitled to considerable weight. Bates, when a young man, knew Culley very well, as he lived in the same neighbourhood, and often visited him, and highly esteemed his judgment in all agricultural matters, although he differed from him on this particular point. It would seem to be the fact that there are very great diversities among cattle. Some are great milkers, some quick feeders, and bad sorts may be found, which are good for neither purpose. But it seems also to be the case that there are cattle which unite both qualifications to a considerable degree, and that it may be possible to perpetuate these advantages in a single breed. Both qualifications depend upon certain common properties. There must in each case be a good appetite for the consumption of food, and great powers of digestion; but in the one case the products of digestion are turned to milk, and in the other to fat and flesh. It is

clear enough they cannot go to both at the same time, and a cow that is giving a large quantity of milk will not lay on much beef. But there seems nothing to hinder the production of meat to go on after the secretion of milk is stopped, and when the yield of milk ceases, the same animal may fatten quickly, and grow to a great size. Its produce also may be rapid feeders and good grazing beasts. Facts, however, will perhaps be more to the purpose here than arguments, and as the point is one well worthy of discussion, I shall make no apology for dwelling upon it to some length. More than 70 years ago, Dr. Anderson of Monkshill, who was himself a practical farmer, as well as a man of a highly cultivated mind, remarked that some animals had come under his particular observation which not only afforded rich milk in very large quantity in proportion to their size, but possessed the quality of fattening in a very eminent degree. One of these was a cow of his own, which not only gave an unusual quantity of very rich milk, but yielded it for about eleven months in the year. He kept this cow until she was ten years old, and states that she was at all times in much better condition than the others kept along with her on the same food, and her descendants retained the same quality for several generations, as long indeed as Dr. Anderson kept them. This cow, which was of small size, and of a mixed Kyloe breed, sometimes gave about seven gallons of milk soon after calving, and when well fed would have averaged about five gallons during most of the year. Some of Charles Colling's famous herd of Shorthorns were great milkers. Old Daisy, for example, gave eight gallons a-day; and the Cherry tribe, one of his best families, were also good at the pail. Magdalena, by Comet, was another cow which yielded eight gallons a-day. Colling reserved her for himself when he sold off his stock in 1810, but afterwards parted with her to Whittaker of Burley. Now these are quantities that are seldom exceeded by the best dairy cattle. Mr. Bates informs us that the dam and grandam of Hubback were both good milkers, and Hubback was one of the best sires and quickest feeders ever known. Perhaps the very best tribe of cows Charles Colling had, and which, so far as we can judge, were his own favourites, was that which is known as the Lady Maynard family, the first of which he got from John Maynard, of Eryholme, in 1786. Robert Colling is reported to have said that it was to the blood of this family that the great superiority of his brother's cattle and of his own was due. Colling bought this cow when seven years old for £30, with 12s. back of a luck-penny, and he kept her until she was nineteen years old, and had bred no less than twenty calves, and was still a fresh-looking cow. She was the dam of Phenix, and grandam of his bull Favourite, which he used more than any other, keeping him until he was thirteen years old. Any one who takes the trouble of looking up the pedigrees of the early Shorthorns will see that Favourite's blood preponderates far more than that of any other animal, so much so that we may almost say the improved Shorthorn breed are the offspring of Favourite. This is the case because they all run back to the Colling's stock, which latterly were perfectly saturated with the blood of Favourite. Now John Maynard himself, who sold this fine cow to Charles Colling, told Thomas Bates that he remembered the tribe to which this animal belonged as far back as the year 1750, and that the originals of them were great milkers, the first three in succession having always to be milked before calving. It is true that of Favourite's blood 50 per cent. was due to the bull called Foljambe, who was his grandsire on both sides, which doubtless led Colling on one occasion to make the remark that Foljambe was the animal that did him most good. He, however, used Foljambe only one season, and to a very few cows, and sold him when he was but a year old. It would, therefore, seem that he did not think very highly of him, although it is worthy of remark that he should have put him to two of his very best cows. Foljambe himself was out of a fine neat cow called Ilaughton, an extraordinary milker, but his sire was an inferior animal, which probably induced Colling to part with him so soon. We see, therefore, that Favourite had a good milking pedigree through both lines, and it is clear that Colling resembled Bates in paying much attention to this point, for many of his animals were not only good, but extraordinary milkers, and it appears that Charles Colling at first kept cows solely for dairy purposes, and that it was only after he picked up Hubback that he turned his attention to the breeding of Shorthorns. The dam of Robert Colling's

cow, Bright Eyes, gave 15 quarts of milk at a meal, and she produced the bull Marske, a noted sire. Another instance of an extraordinary milker being also a capital breeding animal was a cow called Barforth, belonging to Mr. Wastill of Great Burdon, a well-known breeder and noted judge of cattle, and a contemporary of Colling. This Barforth is reported to have given nine gallons of milk a-day, yielding at the rate of twenty-four imperial pounds of butter in the week. She was a well-bred Shorthorn, and dam of Robson's bull, which figures in some of the best early pedigrees. A cow of this kind, I suspect, must be a *rara avis* among the Shorthorns of the present day, and it certainly taxes one's credulity to believe some of these statements; but, from the number of independent witnesses, whose testimony seems to be worthy of credit, we are compelled to believe that many of these early Shorthorns were uncommonly fine milkers, instances of eight gallons a-day being mentioned by many persons, and an affidavit was sworn before a magistrate in America that an improved Shorthorn cow imported into that country produced milk that yielded twenty pounds of butter in the week. Thomas Bates seems to have selected his Duchess tribe on account of their combining great milking powers with an aptitude to fatten readily. I believe Bates is generally considered to have been a trustworthy man in his statements, and correct in his facts, although many thought he had an overweening opinion of his own stock. He tells us that his first Duchess cow, which he bought from Charles Colling, gave seven gallons of milk per day, viz., fourteen quarts at each meal, the practice being to milk only twice a-day, morning and night, and the milk yielded eighteen imperial pounds of butter in the week. He never had a cow that to his knowledge gave more than this. This same cow was the dam of his bull Ketton, a very fine animal, and an excellent sire. As this Duchess tribe has become so famous, and sells at such enormous prices, I may here give a few particulars regarding them. The first of the family we hear anything of was bought by Charles Colling from the Duke of Northumberland's agent at Stanwick, in 1784, for the modest sum of £13 sterling. She was a massive short-legged cow, of a yellowish red colour, with the breast near the ground, had a wide back, and was a great grower. Colling called her Duchess, and had often described her to Bates as a very superior animal, particularly in her handling; and told him that he considered her the best cow he ever saw, but that he never could breed so good a one from her. She was descended from the old stock of Sir Hugh Smithson, of Stanwick. Thomas Bates bought from Colling one of the descendants of this cow in 1804 for 100 guineas, being the same I mentioned as being such a fine dairy animal; and he bought another at Colling's sale in 1810. For the latter he paid 183 guineas, and styled her Duchess the First, and from her all the present family have descended. Bates tells us he was induced to select this tribe from having found that they were great growers, quick feeders, with fine quality of meat, consuming little food in proportion to the progress they made, and also from finding that they were equally remarkable as great milkers. Bates asserted that the tribe improved under his care in regard both to growth, aptitude to fatten, and small consumption of food; but admitted they gave less milk than the first cow of the tribe which he bought from Colling in 1804, although what they did give was richer in butter. I have seen no statement of the actual produce in milk from any of them, except the first one of 1804, and am unable to say to what extent the present Duchesses excel as dairy cows. We may readily allow that Bates improved the breed in regard to form and aptitude to fatten, for several of those he produced, especially after the cross with Belvidere, were remarkably fine animals; and at the first show of the Royal Agricultural Society of England, which took place at Oxford in 1839, he carried off all the prizes in the Shorthorn class except one, for which he had not an animal present. Bates' herd was sold off in 1850, shortly after his death, and the animals were dispersed, and fell into various hands. Some of the best of the Duchess tribe were bought by Lord Ducie, and when that nobleman's herd came to the hammer in 1853, the Americans carried off several of the choicest at great prices. At the present time, I believe, Colonel Gunter's herd contains the purest representatives of the family in England, and his Duchess 77th well maintained the fame of the breed by beating all and sundry at Leeds and elsewhere, carrying

off no less than nineteen prizes and seven challenge emps; but the Colonel, having experienced some of the evils resulting from the state of fatness in which it is necessary to bring out the animals at these shows, I believe wisely declines now to exhibit. We see that, although Bates improved the breed in other respects, he admitted that he was unable to keep up the produce of milk to the same degree he got it in his first purchased Duchess. Not only could he not improve it, although he paid much attention to this point, as he sold much better and reared his calves from the pail, but he allows that the quantity fell off, although the tribe improved in aptitude to fatten. This, then, in so far, is a point in favour of Culley's opinion. But I think it may be accounted for by the close breeding which Bates pursued, and which experience shows has the effect of impairing the yield of milk. Bates had a most exalted opinion of the excellence of his own cattle, but other people didn't always coincide with him in thinking them so fine. His father, George Bates, ridiculed his purchase of the Duchess at the Ketton Sale, and termed her a shabby animal, saying he had many better himself, which his son might have had for nothing. George Coates, editor of the Herd Book, also thought she was only "fair;"—rather faint praise, it must be allowed, and she seems to have been generally considered inferior to the Duchess he previously purchased in 1804. The fact is that Bates had his own notions as to what constituted a good animal, and he often railed at the decisions of the judges at our national shows when they didn't coincide with his own views. By following Sir Hugh Smythson's system of periodically weighing the food he gave his animals, and ascertaining what increase they made upon it (a plan he followed for 17 years), he educated himself into a knowledge of what really were the best sort of beasts, and he recommends every one to examine their stock by this criterion, for it was in this way, he tells us, that he was led to perceive the great difference that exists in the various kinds of cattle, and to know the external character which indicated their real merits. Bates laid much value on the milking property, and on the style, quality of hair, and handling. Good form did not in his estimation compensate for defects in these points. He was a very different man from Charles Colling, who seems to have been a very reserved character, but a consummate judge of cattle. Colling kept his eyes open and his mouth shut, and seems to have invariably declined throwing any light upon his proceedings. His chief object in breeding cattle seems to have been to make money, whereas Bates was full of enthusiasm on the subject, ready to impart his knowledge, and fond of impressing on others his own peculiar notions as to what constituted the points of a good animal. He firmly believed that he had the best tribe of cattle in the world, and wished to have them adopted everywhere for the good of the nation and mankind at large. When he thought a good use would be made of them, he was sometimes very liberal in disposing of his beasts, but where he thought the intending purchasers would cross them with inferior tribes, and thereby spoil the breed, and bring his stock into disrepute, he would occasionally refuse to sell at any price. Bates, as I have already mentioned, said that Charles Colling told him that the first cow of the Duchess tribe which he bought from the Duke of Northumberland's agent at Stanwick was the best he ever saw, and that he could never rear so good a one from her. Whether it was owing to this that her produce turned out so much worse than herself, or for some other reason, it is clear that Colling did not cultivate the breed to any great extent, and on this account it seems to me difficult to believe that he thought so very much of them. On looking over his sale catalogue, we find only two animals of the Duchess blood in it, one of them a two-year-old heifer, and the other a yearling bull. None of the older breeding stock seems to have contained any of the blood, and it does not appear that Charles Colling ever used a bull of the Duchess blood. Now, as his first purchase of the tribe was in 1784, and his sale in 1810, he had 26 years' experience of their qualities, and ample time to have propagated them in larger number if he had thought it for his advantage to do so. Most of the animals at his sale were descendants of the Lady Maynard tribe, and I think we must from this infer that the Duchesses were not his favourites, or he certainly would have had more of them. On turning to the sale-catalogue of his brother Robert, who was only second to Charles as a breeder, and who did not sell off his stock until 1818, we look in vain for any trace of the Duchess blood, and as the two brothers

acted very much in concert, we have here another proof that it was not the tribe they thought most of. All Bates' Duchesses trace back to what he called Duchess Ist, which was the cow he purchased at the Ketton sale in 1810. Now, when we examine her pedigree, we find that 75 per cent. of her blood belongs to Colling's well-known bull Favourite, and little more than 3 per cent. to the original Duchess element. Even taking Bates' first cow of the tribe, which he bought in 1804, we find that her sire and dam were both by Favourite; and her own calf, Ketton, was also by Favourite. This shows how strongly the blood of Favourite was infused into the best Shorthorns of those days. As we trace the Duchess tribe downwards, we find the blood derived from the Stanwick cow dwindling rapidly to so fine a fraction that we can hardly appreciate its being drowned out by other strains, in all of which the blood of Favourite preponderates. So that, if there is any confidence to be placed in the recorded pedigrees, the excellence of even the earlier individuals of Bates' herd must be attributed to the influence of Favourite far more than to any other animal; and it would seem almost absurd to assign any appreciable effect to the infinitesimal quantity of the original Stanwick blood now remaining. Although the family soon became Duchesses only in name, yet they continued to be animals of very select blood, for Bates was very particular in regard to pedigree, and took good care to use none but well-bred sires of the choicest families. Of all the sires he used, Ketton Ist had most of the original Duchess blood, and yet it amounted to only 12½ per cent., 75 per cent. belonging to Favourite; for Ketton, as we have already seen, was not only himself got by Favourite, but his grandsire and grandam were so too, which shows to what an extent in-and-in breeding was sometimes carried in those days. Bates had another sort which he held out as an example of the combination of great milking and feeding properties. These were the progenitors of his Oxford tribe. Matelch, his first cow of this family, he tells us, never gave less than twelve quarts of milk at a meal, when on the grass after she dropped her calf. She was the dam of an excellent cow, which Bates called Oxford Premium, because she carried the first prize at the Royal Agricultural Society's show at Oxford in 1839. She also gained the highest premium at the Yorkshire Society's show in the year following. This Oxford Premium was also a good dairy beast, often giving milk the whole year round, without being put dry for calving. I have dwelt at some length on Bates and his herd, as these two tribes of his—the Duchess and the Oxford—have been more run after than any other races in existence. Our American consins are generally reckoned an acute and enterprising race, with a good judgment in the practical affairs of life. It was their bid of 700 guineas for Duchess 66th, at Lord Ducie's sale, that first opened the eyes of the British public to the value of Bates' blood in the market. The present rage for animals of fashionable pedigree, and the extravagant prices of late given for the so-called grand Dukes and Duchesses, remind us of the tulip mania in Holland, which happened more than two centuries ago. The Dutchman, solid and phlegmatic as he is usually reckoned, yet, on that occasion, showed he had a fine vein of enthusiasm in him, and the passion for these interesting plants became so strong that nothing else seemed to the Dutchman worth living for. High and low were carried away by it. Not only speculative merchants, but steady farmers, and men of all classes, from the nobleman to the chimney sweep. Single bulbs sold for 2,000 florins, just as we see an innocent calf now sell for 1,000 guineas: and there were fashionable strains of tulips in those days just as there are of Shorthorns now. One sort, called the *Semper Augustus*, seemed so enviable that a man offered for a single root of it no less than 4,600 florins, together with a new carriage and a pair of horses, with harness complete. Another madman agreed to give twelve acres of land for a root, and gambling in tulips became for a time a consuming passion, just as gambling in railway scrip was many years ago in this country. Who knows therefore but we may see a further development of this excitement regarding pedigree Shorthorns? for enthusiasm, once awakened, is catching, and no one can tell how far a Briton may go for a Shorthorn, when we see to what length the Dutchman went in his passion for tulips. Pedigree is no doubt all very well, but a long pedigree on paper is not always a good one in fact. Many of these fashionably-bred animals are notoriously bad beasts; they have in many cases

been bred so long without proper judgment, and from nearly related blood, that vigour of constitution seems to have been irretrievably lost. They have become ewe-necked, weasel-waisted, leggy, and consumptive, can't stand bad weather, and give little milk; and, doubtless, there are occasional flaws in the pedigree that don't appear in the herd-book, or in the sale catalogues. Our improved races of domestic animals have attained their high degree of excellence by being bred from carefully-selected animals, with a constant weeding out of the bad ones, and it is only in this way that they can be kept up; but to do this requires a degree of judgment and perseverance that few possess. It is men like Charles Colling, Thomas Bates, and Richard Booth that have made our cattle what they are, and it is by men of a similar stamp that we may expect to see them further improved, or even kept from deteriorating. Probably no herds of cattle have turned out such a number of first-class animals as those of Warlabry and Killerby. The Booth family have been noted breeders of Shorthorns for three generations. The herd was founded in the days of Colling by Thomas Booth, who then owned the Warlabry and Killerby estates. He was succeeded by his sons Richard and John, of whom the former established himself at Warlabry, and the latter at Killerby. Although both are now dead, yet the family happily still survives in the descendants of the latter. The animals bred by the Booths have been noted for their fine forms, massiveness, and heavy flesh. It may therefore be worth inquiring whether, in a race of cattle so distinguished for substance and feeding quality, we can find instances of these characteristics being united to good milking powers. Now, according to Mr. Carr, this happened in a number of cases; but, as he does not give the actual measurement of the quantity of milk yielded by any of them, there is a looseness about his statements which I am unable to rectify. Some of the original stock of old Thomas Booth are said to have been good dairy cows, and great grazers when dry; and the first of Richard Booth's Isabella tribe was a cow he bought in Darlington market, which gave brimming pails of milk, and, nevertheless, had a remarkably ample development of the forequarter, an unusual feature in a good milker. Mautain, a celebrated prize-winner, and the ancestor of a fine family of Shorthorns, is said to have been an excellent dairy cow, and so was Toy, dam of the famous twins Neck-lace and Bracelet. Among others of the same characters, I may mention Bliss, the first of the tribe which goes by that name. She was a very heavy milker, and so was her daughter Blithe, the latter being known to produce two or three calves in successive years without ever going dry. She again was dam of Lady Blithe, who has produced more first-rate animals than almost any other cow in recent times, but had no showy pretensions herself, being just a well-bred dairy cow. Safin was another, all a dairyman could desire, giving great quantities of rich milk, suckling two calves, and required milking after them. Princess Elizabeth, by Crown Prince, combined milking and grazing qualities in a very unusual degree, and produced Queen of the Isles, a first prize winner at Chester. Caroline by Fitz Leonard, we are told was a prodigious milker, giving four pailfuls of milk in the day. Camp Follower was also an extreme milker, and died of milk fever, yet shew as a very fine cow, and produced some first-rate stock. Indeed, some of the admirers of the Booth blood go the length of asserting that all the Warlabry tribes were famous for possessing more than ordinary milking powers. These examples may suffice to show the possibility of uniting in a considerable degree the two desirable properties of giving much milk and fattening well, and I may further mention that Mr. Whitaker of Burley and Mr. Wilkinson of Lenton, who both bred many excellent Shorthorns, kept their herds expressly for dairy purposes. Mr. Youatt and the Rev. Henry Berry also agreed in thinking it quite practicable to combine good milking and feeding qualities in the same animal. Mr. Berry had experience of it in his own herd; while Youatt says that many of the cows in the London dairies are as fine specimens of the improved Shorthorn as one could wish to see. It is evident that it would be very desirable to have a breed in which this combination of advantages could be secured, for a race of cattle where the cows scarcely give milk enough to bring up one calf properly must be reared at a great disadvantage, and however excellent they may be as grazing or fattening beasts after they do grow up, yet the cost of rearing the calves during the first year is too great, since it may be said to involve the

whole expense of keeping the cow for a twelvemonth. On the other hand, in a dairy breed, where the animals are neither good growers nor quick feeders, the steers are unprofitable beasts, and the cows, when past use for the dairy, cannot be profitably fattened. Our Aberdeenshire farmers must have something that will feed well, come to the dairy what will—something that will be prime Scots in the London market. They like to see big fat oxen, heavy animals, round as a hog's-head. They don't trouble themselves with your stots of 8 lbs. or 14 lbs., but always reckon their animals by the hundred-weight. This taste for fat beasts has certainly led to the deterioration of the cattle as milk producers, and I rather suspect the Aberdonian in general would agree with Culley in his opinion that first-rate feeders are not to be had from a dairy breed. The fashion of judging at the local and national shows has also tended in the same direction. Round, well-fed animals always look so much better than leaner ones, that nothing has any chance of a prize unless it be fat; and the fatter you can make it, so much better is its chance. Exhibitors are, therefore, obliged to conform to the fashion, and good feeding and skilful training are half the battle. This, however, is ruinous to the animals for breeding purposes; and many of the best ones are spoiled in this way every year. But breeders say they can't help it; they must keep up the character of their herds by exhibiting at these shows, and taking prizes—otherwise, they would lose ground. The evil, it seems to me, might be remedied to some extent by a more careful selection of judges. If possible, men should be got for the purpose who are themselves eminent as breeders, and can distinguish the value of an animal in a lean state, even when pitted against one that is much fatter. If the judges also were selected by the breeders, and not by committees, composed often of people who have little experience in that line, perhaps a better mode of judging might be gradually established at our national shows. Valuable prizes should also be given in the proper classes for animals uniting fine symmetry with good dairy qualifications. If the breeders of Shorthorns and other races of cattle would also afford some information in their printed catalogues as to the milking pedigree of the animals they offer for sale, I think they would soon find that their customers would appreciate it, and that animals well-come in this respect would be looked after, and would fetch high prices at their sales. At present, it is difficult ascertaining anything in regard to this point. The Ayrshire is the type of a dairy animal, and it is very proper that those who rear them should make the development of the milking powers their main object. Let them go as far in this direction as they can, so that we may see what sort of animal will emerge from the continued cultivation of this special feature. The origin of the Ayrshire breed is not very exactly known. It seems to have arisen by a process of selection made with a view to the production of milk and hardness of constitution, without much regard to anything else. Very likely there has been a mixture of various elements; for we learn that there were importations of Durliam cattle by the Earl of Marchmont, in 1750, and of Dutch cows by Mr. Dunlop of Dunlop about the year 1760. There has probably also been an infusion of the Alderney, or breed of the Channel Islands; for Quayle, who

wrote the *Agricultural Survey of Jersey*, states that the Ayrshire was a cross between the Shorthorn and the Alderney; while Col. Le Couteur informs us that General Andrew Gordon, when Governor of Jersey, about the end of last century, sent some of the best cattle to Scotland. A veterinary book, published at Glasgow in 1794, likewise states that the Dunlop cows, which were considered the best milkers, had been produced by crossing the native cows with bulls brought from the island of Alderney. The general resemblance of the Ayrshire and Alderney cattle has been noticed by Professor Low and Col. le Couteur. Youatt, however, seems to think that the Ayrshire breed has originated from a cross of the Holderness with the Highlander; the former giving the milking properties, and the latter the hardness of constitution and small size. The prevailing colour of the Ayrshires is red and white in various mixtures; sometimes they are wholly red, but I believe never wholly white, which is rather curious, for in the Shorthorn, which is also red and white in all proportions, pure white animals are constantly occurring, as if there were an innate tendency to that colour. As Mr. Caird has remarked the great demand for dairy produce has in a great measure made the Ayrshire breed. It has been developed from a variety of different elements by a process of selection. The great mining and manufacturing population of the district in which the breed is located has given rise to a constant demand for milk and butter, and the climate and soil being both favourable for cow feeding, there was a strong inducement to cultivate dairy farming, and to select such animals as were most noted for giving milk. We see that there were importations of Dutch, Alderney, and Durliam cattle—all good dairy breeds. We may be sure that the best milking cows were retained, and the worst ones got rid of as soon as possible. The necessity for acquiring good cows would sharpen the powers of observation in regard to what constituted the outward signs of a milk-producer, and thus the judgment would be educated as to the points to be looked for. Carry on this process for generations, and you have the result. Just as the dense manufacturing population of Lancashire and York has developed the Holderness breed, so has the great seat of Scotch manufactures developed the Ayrshire. The Yorkshire dairy cow is just an Ayrshire on a large scale. All the essential points of the animal are similar. The fine neck, light fore-quarter, deep rib, thin skin, lean back, good udder. Even the colour is very much the same, but there is a considerable difference in size. These dairy breeds, and, in fact, most great milking animals, are distinguished by having a lightness of fore-quarter, a sharpness at the top of the shoulder, with rather a small girth round the heart, and a general leanness along the back. Now these features are disapproved of in a feeding animal, and the question is, can we get rid of these features without damage to the milk? can we get a right development of forequarter and a good girth round the heart in a first-rate dairy cow, or are the two things incompatible? I think the evidence I have adduced in the course of this lecture is sufficient to encourage us to attempt it, and to make us hope that we shall eventually succeed in uniting good feeding and growing properties with first-rate qualifications for the dairy.

THE OPENING OF THE FOREIGN CATTLE MARKET.

The new foreign cattle market, erected by the Corporation of London on the site of Deptford Dockyard, was formally opened on Thursday, Dec. 28. It had been decided that there should be no ceremony on the occasion, and the proceedings were of the plainest and most unostentatious character.

The Lord Mayor and Mr. Sheriff Bennett, accompanied by the comptroller and several members of the corporation, proceeded to the market about half-past nine o'clock, and were received by the Markets Committee, headed by their chairman, Mr. J. F. Bontems, the City architect, Mr. Horace Jones, and by the superintendent, Mr. Philcox. They were then shown over the market, which the Lord Mayor thereafter declared to be open. The market has been constructed under the powers and provisions of the Contagious Diseases (Animals) Act, 1869, for the sale and slaughter of foreign animals arriving in

this country, with a view to prevent the introduction and spread of infection. The site and certain buildings upon it were purchased for £91,640, and designs for the market having been supplied by the City architect, the work has been completed in the short space of six months. The process has not been one entirely of construction, the committee having, to a large extent, availed themselves of the erections that they found upon the site by adapting them to the purposes to which they are henceforth to be applied. The "slips" were filled up with rubbish excavated from the site of the New Law Courts and soil dredged from the bed of the river, and wooden sides having been fitted to the lofty roofs that covered the docks, they have been converted into well lighted and ventilated sheds. From each of these (three in number) a pier stretches out into the river, and as there is a depth of 12 or

13 feet of water at low tide, vessels can lie alongside and discharge their cargo at any time. Lairage accommodation has been provided in the sheds, the Admiralty store-shops have been converted into slaughter-houses, and the old spar sheds are now to be used as fodder-houses. All animals imported will be inspected by a resident veterinary staff, and in the event of disease being discovered the pier where the animals are landing and the shed from which it abuts will be kept isolated. An ingenious provision has been made for the destruction of infected animals. The carcass is hoisted into a cylinder, having the appearance of an immense boiler set on end, and there, by a strong application of steam, it is thoroughly disinfected, so that the fat and other parts may be devoted to any purpose for which they are fit. There are both wooden and iron pens, some of the latter fitted with folding hay-racks, and others with iron cradles suspended from pulleys that may be raised at pleasure, leaving the pens clear. The water-troughs will be kept constantly supplied with water by a self-acting process. Accommodation has been provided for 3,000 cattle and 11,500 sheep, allowing 30 feet superficial for each of the cattle and 5 feet for each of the sheep, but in case of emergency 22 feet can be made to do for cattle and 4 feet for sheep, so that upwards of 5,000 cattle and 14,000 sheep can be received. The slaughter-houses are fitted with machinery of a novel character, suggested by Mr. Rudkin and Mr. Brewster, members of the Markets Committee. After a bullock has been killed and dressed it is raised by a hand winch to a couple of hooks that traverse parallel rails running from end to end of the shop, and from these beams the carcass is lowered by means of pulleys. The work can thus be carried out in a very expeditious manner. The slaughter-houses for sheep are also appropriately fitted. The whole of the sewage, it may be stated, after being disinfected, will be taken away in carts or barges, there being no underground sewage works. The total estimated cost of the market is £210,000; of that the site absorbs £95,000. A sum of £18,000 has been put down for lairage, £15,000 for piers, £15,000 for slaughter-houses, £18,150 for miscellaneous purposes, and £18,350 for contingencies. The market days are Mondays and Thursdays, and the hour of commencing ten o'clock. A portion of a monastery, built of red brick, that once stood upon the site, still remains, and bears the date "1513." The inspection of the market having been concluded,

Mr. BONTEMS said—My Lord Mayor and gentlemen, the markets committee give you a cordial welcome to this, the scene of their recent labours, and some of you know how difficult those labours have been; to select a site for a market amid so many conflicting interests, and to construct that market at the expense of one public body, subject to the approval of another, and to do so with no definite idea of the amount of accommodation that would be required, was no easy task. But it is not for us to speak to-day so much of the past as of the present. I may say in passing, as a statement has been made, or, if not a statement, an insinuation, that considerable delays have occurred, that the fault of that cannot be placed either to the credit of the markets committee or to the corporation. My Lord Mayor, the time has now arrived when this work should be dedicated to the public, and the committee felt that no one could be asked with so much propriety to open the market as your lordship. You are the honoured and respected chief of the great municipal body at whose expense the market has been constructed, and therefore it was considered that you, as Lord Mayor of London, should declare the market to be open. But, before I ask you to perform that ceremony, perhaps you will allow me to say a word with respect to the market itself. As to the site, it is one possessing considerable historical interest. It has been appropriated to some of the most useful purposes to which national property could be appropriated. As the site of a monastery ages ago, it was the fountain from which the learning and religion of that day spread amongst the surrounding population, and even to the metropolis itself. Since then, as the place where some of our best ships have been built, it has contributed to the defence of the country, and, contiguous as it is to the palace at Greenwich, one cannot help calling to mind the event which took place in the reign of Queen Elizabeth, when the whole mind of the country was devoted to the question of national defence by means of ships, probably built on the spot. In the adjoining shed the celebrated Czar of Russia, Peter the Great, worked as a ship carpenter, little thinking it would one day be

devoted to the sale of cattle imported from Russian dominions. Perhaps it may be considered that the site is to be appropriated to a purpose inferior to that to which it has hitherto been applied, but, after all, the supply of animal food to the constantly increasing population of London is a matter of no small concern. Therefore, I consider the site will be still honoured in being used for the benefit of the public. Consider the area—22 acres of land; sufficient not only to provide accommodation for the present wants of the foreign cattle trade, but to meet any prospective requirements. Then look at its river frontage, of nearly 1,100 feet; there was no other site within easy access that presented so desirable a frontage. Then look at the landing facilities, the facility for landing at all stages of the tide, both at the highest and lowest, so that the cattle ships will not be detained with their cargoes. Then the large quantity of useful buildings found on the site. These sheds were all covered in ready for our purpose. We had an expensive and troublesome work in filling in the docks, but see what elegant and commodious sheds are made by appropriating them. A new shed made next to this, and which, as you observe, has a low roof, is not nearly so commodious in its appearance as these larger sheds that were ready to our hands. The houses surrounding the yard are all appropriated for distinct purposes, some for the use of the bankers connected with the market and some for the Government officers, and also for our own officers. We shall be able to fill all the houses, and there will be in them sufficient accommodation for all. As to the position of the market, objection had been made that it was not on the north side of the river, but I think a little consideration will convince us it is not undesirable to have a large market on the south side of the river. The population on the south side is one-third of that of the metropolis, and as the other side has a large market for live animals and another for meat, it may not be considered undesirable to have the new market on the south side. Well, then, as to its construction. You have seen the noble piers, which I consider do credit to the gentleman who has built them and the engineer who contrived them. They are built substantially and plainly, and are exceedingly well adapted for the purpose to which they are to be applied. The sheds have been converted into lairs by the enterprising builders, Messrs. Browne and Robinson, under the superintendence of Mr. Jones, our own City architect. But I must tell you that we are very much indebted for the arrangement of the lairs to two gentlemen, both members of the markets committee, who have taken a very anxious and useful part in the construction of the market. I can hardly tell you how much the committee is indebted to Mr. Rudkin and Mr. Brewster for the great trouble and pains they have expended on the market. I am sure they have passed many anxious, if not sleepless, nights in considering the various arrangements that it was necessary to make, which those only acquainted with the requirements of a market could comprehend or carry out. Then I may tell you that ample provision has been made for the cleansing, drainage, ventilation, lighting, and water supply of the market. As to the amount of accommodation, it is so great that those connected with the cattle trade are surprised we should have been called upon to provide so much accommodation. For the slaughter-houses we have a hot water supply, and the machinery includes what is called a "diger" for infected animals. A whole bullock may be placed in it, and, by means of steam at a high temperature, the infection is very soon destroyed, and the fat and the remains of the animal are taken out free from all infection and ready to be applied to any purpose for which they are fit. It is only fair to the vice-president and officers of the Privy Council to say that they have been most anxious to make provision for the disinfection of animals. They have done their very utmost to explain to the markets committee the means by which infection might be prevented from spreading, and I need not tell you the markets committee have only been too ready to carry out their wishes, so that this market may be as perfect in that respect as it is possible to make it. A comparison has been drawn between this market and its landing and lairage accommodation with other places used as markets on the north side; but persons who have seen those places and who have seen this market and all its provisions do not require to be told that there is no comparison between this market and any other place. You might as well compare Regent-street with Rag-fair as this market with any other place. One or two objections have been made to some of the arrangements. It has been said

the time for holding the market (ten o'clock) is not a convenient time. That hour was selected at the express suggestion of gentlemen connected with the trade. It appears to me the arrangement is the best that could be made to prevent contagion by using the two markets, because if a salesman goes to Islington the first thing on Monday morning, and comes here afterwards, he cannot take the contagion from here to the Islington Market, although he may bring it from the Islington Market to this one. We have given the longest time for the disinfection of persons going from one market to another that it is possible to give. Then it has been objected that there was railway accommodation on the north side of the river, and not on this. It so happens that there is not railway accommodation on the other side, and the facilities for making railway accommodation are greater on this side than the other. Moreover, this market is nearer the City than any other site that could have been selected, and that would have been at all appropriate for such a market. As to the question of nuisance to the neighbourhood, I am quite sure the people of Deptford may be satisfied on that score. Such care has been taken for carrying away anything that could cause impurity to the air, that certainly the health of the neighbourhood will not be diminished. It only remains for me to thank your lordship for complying with the request of the committee to be here to-day, and also to thank the gentlemen present for their attendance, and to express a hope that this market may by its management be a credit to the corporation and a blessing to the people.

The LORD MAYOR, in declaring the market open, said: Mr. Chairman and gentlemen, I feel, I assure you, very much gratified in being allowed to take part in what I consider a most important affair. The inaugurating of a market of this character is a great honour. It will prove to be one amongst

the many works in which the corporation have been engaged, and which they have carried through and completed so much to the satisfaction of the public. Your chairman has certainly delivered a most interesting speech connected with the details of this gigantic work, for it is gigantic. I have felt very much gratified with those portions of the market I have seen. I have been very much struck with the solid way in which everything has been constructed, and there is one matter especially pleasing to my mind—there is no evidence of extravagance or unnecessary ornamentation in what I have seen. I think great care has been taken, and it is not surprising that great care should have been taken, because the members of the markets committee are men of experience. They have brought to bear a large amount of intelligence, and it is evident that everything has been done to promote the comfort of those who will come here to deal in cattle. With regard to its being a great boon to London, there can be no question. A market for foreign cattle has long been a matter of necessity, and although great difficulties arose both with the Government as well as with the corporation and the Board of Works, all those difficulties have been cleared away, and I think the corporation were fortunate in securing this site. It would have been impossible to find an area nearer to London with all the conveniences this one possesses. In now declaring this market to be open, I hope and trust it will be successful in every way, and if we can by its means induce foreigners to fatten and send their cattle here, so that we may obtain a reduction of the very high prices we have been paying for animal food, it will be a great boon. I trust it will be a great success, and I have much pleasure in declaring it to be open.

At the request of the Lord Mayor, three cheers were given for the success of the market.

THE SUPPLY OF AGRICULTURAL LABOUR.

At a meeting of the West Suffolk Chamber of Agriculture at Bury St. Edmund's, the president, Lieut.-Col. F. M. Wilson, in the chair, the subject for discussion was "The supply of agricultural labour with reference to the classification of wages."

Captain HORTON, R.N., said this question was one of high national importance. It was in fact no less than this, "How shall we best succeed in maintaining a supply of labour suitable to meet the present requirements of agriculture." This problem had to be solved in the face of the fact that the conditions of labour in all branches of industry were undergoing great and constant disturbance, and that they had already to deal with a generation of labourers much better instructed, and as a consequence more restless than heretofore. His (Capt. Horton's) career in the navy had afforded him some opportunity of arriving at certain conclusions with reference to the subject. Both the Army and Navy offered some features suggestive of example not unworthy of imitation elsewhere. The analogy of husbandry with the army and navy existed only in so far as the extent of the work to be performed, for the organization of agricultural labour seemed to be in no degree equal to the demand for it. A farmer had under him, perhaps, a bailiff, then a waggoner, shepherd, stockman, and those who work immediately under them, with certain other men and boys not in constant work and apt to be paid off during many consecutive weeks at different seasons. Happily this state of things had been in a great degree modified through the introduction of machinery; but it was important to consider how it might be still further improved, and the employment of labour become more uniform throughout the year. He pointed out the evils which result from men having uncertain work, and proceeded to compare those engaged in agricultural labour with the same class enlisted in the army or brought up in the navy. Taking the average wages (including hayseed, harvest, &c.) of agricultural labourers to be 16s. a week, as had been stated by a gentleman who had been at pains to calculate it, he said the corresponding money value in the navy was represented by an able seaman of the first class. This man, for misconduct, might be reduced to the second class. Below the A.B.'s

were the ordinary seaman whose wages were about £4 a year less, and who were also divided into two classes, and then the boys, who form two classes according to their age. A somewhat analogous classification existed in the army. He classed the waggoners, shepherds, cowmen, and engine-drivers as corresponding with able seamen or private soldiers of the first class, and the men next them in each department ready to supply their places with the second class, whilst the third class might be made to include all the remaining bone and sinew of 15 years old and upwards. Lads of less age might also be classed as boys of the first and second class. Very great advantage would accrue both to employers of labour and those they employed, if the farmers were to adopt a system of engagement, whereby they should have in their power to stimulate and reward the better energies by advancement in grade and wages. The same system would also strengthen their hands with reference to their less industrious labourers by enabling them to reduce their grade for continued dereliction of duty. By this means the farmer could from week to week impose a fine upon his men if they failed in their duty or engagements, while he must impose upon himself a sense of the duty which would attach to him of conferring the rewards upon deserving men without delay, as well as that of administering the penalties in strict justice and apart from the influence of any momentary irritation. How many a man was now turned off a farm almost without a hearing because his master had no other means at hand to punish him! and on the other hand how many a valuable man was induced to quit his parish and seek work elsewhere because he found his family increasing while he had no prospect of improving his condition so as to be able to maintain his position. The system he proposed would offer great facilities for the adoption of piece work. If the system were adopted in a district there would follow a system of certificates of service to the men in each class which would facilitate their employment by other masters, and he advocated the establishment of a kind of labour office after the manner of a domestic servants' registry. Among the advantages of such a labour office he mentioned that it only required that

some facility of intercourse should be established for a more regular distribution and employment of labour to ensue, and he gave an instance which showed the small amount of regard which men bestow upon the distance they have to go to work. Captain Horton then made somewhat lengthy quotations from the paper of Mr. J. Dent Dent, M.P., on 'The Present Condition of the English Agricultural Labourer, in the *Royal Agricultural Society's Journal*, and on the question of the employment of women in agriculture said he did not hesitate to state it was his opinion that they would do wisely to encourage the employment of female gangs according to the provisions of the Act to assist in getting some of the thistles out of the land. In conclusion, he said personal activity and quickness of movement on the part of the labourer were qualities valuable to his employer. They required cultivation in youth as much as maintenance during manhood. This was a difficult matter, but well-shod children taught to use their limbs with activity were all the more likely to prove useful labourers under a system of payment, which by the promotion or reduction of a labourer's class and position on the farm would cultivate in the minds of the men the sentiment of self-respect which was an agent far more powerful than money. Those were wise words of Lord Treasurer Burleigh's to his son—"Keep rather two too few than one too many. Feed them well and pay them with the most, and then mayest thou boldly require service at their hands."

The CHAIRMAN said Captain Horton had very wisely not gone into the general question of the price of labour; for however much they might wish to pay the agricultural labourer much more than they did, it was very questionable whether the farmer could afford to give higher wages—unless he could get a more skilled labourer to do more valuable work. With the exception of the present year, mixed soil and light land farms had had a very hard time of it lately, and more money had been lost than made upon them. He reminded them that wages must be to a great extent governed by the law of supply and demand. After a reference to piece work the chairman touched on the question of the labourer keeping a cow. No doubt nothing was so good for rearing children as milk, but he did not hold with the labourer keeping a cow, thinking it much better that the employer should sell him the milk. For a labourer to own a cow was putting too many eggs into one basket—the man's whole capital would be invested in it, and if the cow died he lost all, and then he would be going round with a brief for subscriptions.

Mr. F. PAINE (Barton) read a paper on the subject, in which he said there was no doubt a good and cogent argument against the almost universal custom in that neighbourhood of paying by the day instead of by the piece, and pointed out that under the existing system there was no encouragement for the really superior man to show his full value. This state of things had been brought about by several causes, one great reason being the excess of labour, which had induced farmers, in order to keep the men generally employed, to pay low wages by the day rather than have the same work done on the piece, which would have enabled some to earn better wages, whilst the less competent men would have got little or nothing at all. Such a system must be wrong. Somehow farmers had more incentives to employ labour than other industries, for a farmer was sometimes induced to employ more hands than he really wanted rather than let them go to the union, where he would have to help to support them, whilst other employers were actuated by no such motives. He alluded to the great change which had been effected in farm work by the introduction of machinery, and expressed his strong opinion that one thing which would raise the condition of the agricultural labourer was better education. His paucity for the poor man was increased knowledge, and gentlemen who were anxious to raise the agricultural labourer could do it in no way so effectually as by using every lawful means to compel the education of poor children. It might not bear fruit in their own time, but it certainly would in the next generation. Education would lead to independence; for it was only the truly ignorant who would consent to be as it were crushed to the earth. Give a man half an education and he would thirst for more knowledge and independence. And what applied to the individual applied to the nation—the better the people of any country were educated so much the more firmly was the independence of that nation secured.

Rev. T. E. ABRAHAM thought it desirable that they should

take some steps to improve the condition of the labourer before they were compelled of necessity to do so, and before any pressure was brought to bear on them. The agitation for shortened hours of labour was not likely to affect agriculture, but the question of the rate of wages must be looked in the face—it would come before long, and would it not be better to anticipate it rather than wait till their population was entirely drawn off? That they were flocking out of that part of Suffolk there could be no question, and he was not at all sure that the employer would lose by an increase of the wages; if they could get a better, more industrious, better-fed, more contented man it would be a necessity for the employer to give better wages. He believed five industrious, contented labourers at 12s. a week would do more work than six men at 10s. a week. He called attention to an Act of Parliament passed early in the reign of William IV. which enabled trustees of "fire" allotments to give portions of the allotments to industrious men of good character. This, if carried out would be of very great advantage, and he further enlarged upon the desirability of the labourer having a good cottage. He hoped a law would be passed reducing the number of publichouses, and the hours during which they were open, and he believed improved education would tend to give a more contented and provident race of labourers.

Mr. G. GAYFORD admitted that it would be extremely advantageous to have such a classification of labour as Captain Horton had suggested; for how was it possible for a good man to avoid feeling his energies damped if he received no more money than a man whom he knew to be much inferior to himself. Wages must depend on supply and demand, and he was not so sorry as some to see men leave the district; because if there was a surplus of labour, and the men could better themselves by going elsewhere, it was desirable that they should go. One great want was a more equal distribution of labour, and in proof of this he showed that in the parish of Ingham the proportion was $\frac{7}{10}$ acres to each individual; in Honington it was 3 acres; in Risby, $6\frac{1}{2}$ acres; in Great Saxham, 5; in Little Saxham, 8 acres; in Deunham, 6; whilst in Barrow it was only 2 acres to each inhabitant. The consequence was that farmers in the parishes round Barrow employed Barrow men at certain seasons when they wanted extra labour, and as soon as they had done with them sent them back to Barrow. Every landlord ought to be willing to supply each farm with a good number of comfortable cottages. No gentleman would think of letting a farm without a stable to put the horses in, or without a sty to put the pigs in, and why should they let a farm without cottages to put the labourers in?

Mr. MANFIELD believed the labourer was never so well off as now, for he was better paid, clothed, and housed than formerly. As to classification of labour, it appeared to him that they had it already, the first class consisting of horsemen, shepherds, stockmen, and engineers, who were paid higher wages than the ordinary labourer. In the second class were all the ordinary run of labourers, good, bad, and indifferent, all paid at one price, which was a very bad arrangement. He advocated doing all the work by the piece that could be so done. As to the supply of labour, he denied that it was short. One objection to a classification was that there were times of the year and kinds of work at which the best man would be worth no more than the inferior, and if he did not pay the inferior man at the same rate as the superior, the former would not stop with him.

Mr. J. S. PHILLIPS objected to piece-work because it implied a want of confidence between the employer and the employed. As to shepherds, horsemen, &c., being paid higher wages, he asked if their hours were not much longer.

Mr. PAINE: They do seven days' work instead of six.

Mr. HUNTER RODWELL admitted the desirability of a classification of labour, but confessed his inability to see how it was to be carried out further than it already was by paying extra wages to horse-keepers and shepherds, who, though they did more work, had the advantage of constant work, whether wet or dry, to the thatcher, the drill-man, and the engine-driver. Any gentleman who could suggest a mode by which a classification could be carried out would be a benefactor to both the farmer and labourer. Mr. Gayford had spoken about landlords building cottages, but he would suggest to that gentleman to recommend the Barrow people to pull down a few of theirs.

Rev. C. W. JONES (Pakenham) thought one classification operated most injuriously—that by which a man was treated as a boy till he married, and which never gave him full wages till he married. (Strong expressions of dissent.)

The CHAIRMAN hoped two statements which had been made would not go forth as the opinion of the Chamber. Great stress was laid by one gentleman on the circumstance that by improving cottages and giving allotments they would render the labourer more contented, and he wished to guard against an impression being created that this Chamber considered the agricultural labourer discontented. Another gentleman said that none but the ignorant and uneducated men would be crushed to the earth, and he should not like it to go forth

that the Chamber was of opinion that the labourer was crushed. That gentleman advocated increased knowledge, and he asked whether education was not spreading, and whether there was not every prospect that it would spread more and more? As to the cottages, he agreed with Mr. Gayford, but there had been an improvement in that respect, and though he disliked to allude to anything personal, he believed there were cottages enough on the land he owned, and to every one was attached a garden or an allotment.

Captain HORTON having briefly replied, a vote of thanks was passed to him, and a similar compliment to the Chairman closed the proceedings.

THE IXWORTH FARMERS' CLUB.

LABOURERS' DAUGHTERS.

At the last meeting, the subject was The Education of the Daughters of Agricultural Labourers. The chair was taken by the President of the Club, Mr. Edward Greene, M.P.

Mr. GEORGE GAYFORD, jun., said that up to the present their attention had not been specially directed to the improvement and encouragement of the female members of the labourer's family, and he thought that in no way could this be done more effectually than by directing attention to, and proficiency in, the performance of such plain, practical duties of every-day life as would tend to make them good servants, wives, and mothers. He had used the plain old-fashioned word teaching, as he did not wish to enter into the general question of education, preferring to leave that in better hands. They might compare the teaching of a child to the rearing of a building—both required a sound and good foundation. How were children to stand the trials and troubles to which they would be exposed, unless a good foundation was early laid by practical and judicious teaching? He would not enter into the question of whether the present system of education was right or wrong; but he would say, without going into such questions as that, it appeared to him that it was their duty to endeavour to lay a sound, solid foundation by trying to teach and encourage those plain duties of every-day life which they knew must be well performed by the wife, if a man's house was to be made comfortable and happy. It appeared to him that this part of the teaching of the daughters of agricultural labourers had been, and still was to a certain extent overlooked; and he thought they would all see there was an increasing tendency to allow a regard for mere outward show and fashion to take the place of utility and comfort. After stating that this was his reason for bringing the subject forward, Mr. Gayford proceeded to say: Two men may be living under the same roof whose circumstances shall in all respects be similar—the family of the one will always appear tidy, comfortable, and well fed; the other, ragged, uncomfortable, and half-starved; and often because the one has a tidy, careful, and industrious wife, who has been well taught, knows the value of time, and how to make the best of her small income, while the wife of the other, who may have been, perhaps, a more showy and fine-dressing girl, is, from the neglect of good training in early life, destitute of those qualities, and that useful knowledge possessed by her neighbour. Now, whenever the latter state of things prevails, can we expect good conduct and industry in the husband who is neither a contented nor a happy man; and if we can do anything towards rendering such a state of things less frequent, we shall not only benefit the labouring man but society generally. And how is this to be done? I think in a very simple way, by taking for our guide that Book which should be the foundation of all teaching, in which we are told to do our duty towards God and towards our neighbour. The public instruction in the first of these duties we may leave to those whose special mission it is to teach it; but the second, I think, comes quite within our province, and we are plainly told that our duty to our neighbour is to learn and labour truly to get our own living, and to do our duty in that state of life to which it may please God to call us. And I say that if the teaching of these plain truths is in any way neglected, and is not constantly impressed upon the minds of the young, all

other education will lose much of its value; and I fear that all education bills, school boards, certificated teachers, and government inspectors, will be of but little use, and will fail in producing the good effects anticipated by their advocates. If you, gentlemen, consider it desirable that we should encourage such a system of teaching as I am in favour of, I would respectfully suggest that we should appropriate from our funds such a sum as we can spare to be devoted to giving prizes to the daughters of agricultural labourers, for skill in bread-making, plain sewing, mending clothes and stockings, knitting, or any other branch of industry likely to be useful to them, or for any special cases of merit or good conduct brought before us. In conclusion, if there should be any person to whom this appears a trifling and unimportant matter, I would remind them that history tells us that woman's influence has always to a great extent swayed the destiny of mankind in all parts of the world, and we know it is still the case, and it is right that it should be so, provided that their influence is properly exercised, and confined within fair and legitimate limits; and I would also remind them that many of our greatest and best men, some of whom have risen from the lower classes, have recorded their conviction that they owed their success in life in a great measure to the teaching of a good wise mother. And again, I would ask them if they do not feel and know that whatever there may be of good in them is mainly to be traced to a mother's teaching and example, and that the evil or wrong in their natures has been more checked and overcome by the influence or the memory of a mother than by any other means. And, gentlemen, this influence pervades all classes of society; therefore I do feel that if we can do anything to raise the standard of excellence and usefulness in the daughters of the agricultural labourers, our discussion will not have been in vain, and we may possibly lay the foundation of much present happiness and much future good.

Mr. R. GREEN (Schoolmaster, Ixworth) also read a paper on the same subject. He said there could be no subject so desirable for discussion at their meetings as the education of the labouring poor, and in his opinion, more especially, the education of the daughters. It was from the class of the daughters of labourers that their servants came, and who, as such, might exercise an influence for good or for evil over their children, and who would also, after their own marriage as mothers, rule the future generations of their class. They (the farmers) of all classes knew that good fruit would not come of its own accord, their experience had told them that as much attention need be paid to the growing as to the ripening season, and he would ask them if they had hitherto taken any interest in the training of young girls. And they ever thought the education of the agricultural poor a matter for their own consideration and benefit? Mr. Green then went on to say: In my opinion the great root of the evil, in many parishes, is the want of proper accommodation in the cottages of the poor. What is the use of talking about decency and respectful conduct to a girl who has passed most of her young life in a sleeping-room with men and boys? What is the use of teaching morality while such a state of things is allowed to exist? But it is said, "We know it, and are sorry for it, but we cannot help it." I ask, "Do you try?" Many, by impatience, get even more than they expect. Why should not

every farmer say to his landlord, "I can employ so many men; build me up as many good cottages, and let me hire them with the farm, so that I may have some influence over my workmen?" Such a system, carried out properly, would be a great help to destroy the present state of things in over-crowded cottages, and, under the management of the farmer and his wife, there might be a special interest taken and an assistance given to remove what may be called the next great evil and hindrance to education: I mean, the want of moral control at home. I don't want to see our labourers treated as serfs or slaves, but I think in some cases a little judicious compulsion may be made use of in this great failing, with great benefit to both parents and children. Among the labouring poor, the parents seem to lose all moral control over their children about the age of 9 or ten years. "Forced prayers," it is said, "are not good for the soul," but I have seen, in parishes where the Squire's Lady had absolute control, better servants and better mothers, than those produced from parishes where everybody does that which seemeth right in their own eyes—in parishes where this one lady is not. Why should not the employers of labour use their influence to incline the parents to more careful training, and the children to understand the necessity of obedience. This kind of aid would greatly help, if not entirely effect a remedy. Should they refuse to accept these kindnesses, then, I say, put in a little sugar and force the medicine down their throats. The next obstruction to a pure education is the cheap and easy means of obtaining finery in dress. Oh! for the days of neat white caps and sensible-sized aprons, instead of the make-believe things worn by servants in these days. This is a very difficult and a delicate question, but I cannot help saying that example is better than precept, and when we see well-educated young ladies with their Alexandrian limbs and Grecian bends, why need we be astonished at ignorance among the maids and dress of its superiors. One thing I would strongly impress upon ladies if they were here present; never give away anything to poor girls which may be converted into useless finery. If they give, let it be something neat and useful. I now come to the last but not the least of those things which militate against the education we all so much desire—the present system of Government education. How can it be expected that the teachers should take the same interest in teaching the heart when their employers and paymasters, the Committee of Council, ignore that King of teaching? Is it not natural that they should attend most to that which brings in the needful to support them? Is it right that a nation should support such men as say to a girl (in effect if not in words), "I care not whether you are taught the religion of your Saviour or not, but at 10 years of age I expect you shall be able to manipulate perfectly all the questions which may be put in our puzzling weights and measures"? Is it fair to tell the schoolmistress, "You must teach needlework in the afternoon, but you shall also bring your girls up to the standard of the boys at the same age, or you shall be plucked"? In other words, "You shall perform your tale of bricks, but you shall have no straw." I tell you honestly the Government system, according to the hard and fast line, by age standards, is nothing but a system of cram, and will never, as a rule, produce what is most wanted. It is all artificial and on the surface, producing contempt for hard work, and a conceited superiority over one's neighbours. In his concluding remarks Mr. Green alluded to the fact that Lady Hoste was alive to the necessities of the Ixworth school, and had provided calico and other materials to be made by the girls into garments, which were to be sold at cost price to the poor.

Mr. FISON said he thought they should begin at the beginning, and that was to improve the dwellings of the labourers. He quite agreed with Mr. Gayford's suggestion that prizes should be given for useful work.

Mr. GOLDSMITH said he should like to go back to the times when farmers' wives and daughters did work. He believed they wanted, in the first instance, to go higher than the labourers' daughters. They wanted to see that the farmers' wives and daughters understood these things. Good servants they could not now expect to find; they were not taught.

Dr. SHORT said he should like to ask the farmers present whether they thought that wives had not, years ago, more influence over the children than they had now. He was a young man, but he could remember that when he was a boy children were more obedient to their parents than they were now. It was astonishing on going into cottages to hear the

impudent remarks that children made to their parents. His experience was not great in the matter of servants, but if they got them they were not what servants were years ago. He did not think the influence of the parents were so much exercised as it used to be. The children grew up giddy, thoughtless, and unfit for the state of life into which they were called.

Mr. H. TAYLOR thought a very great source of the evil was the employment of females in agricultural labour. He had witnessed young females and old ones too, as it were, half-unsexed, employed in labour in the fields, and they were by no means pleasant sights to the eye. But he had witnessed such sights, and he must say that he had considered them as highly out of place. They expected to get their servants from the daughters of agricultural labourers, and what was the consequence? They were led to adopt for themselves the more fascinating occupation of agricultural labour. A girl went to work in the fields, and paid no regard to the preservation of her character. If she lost her character as a domestic servant there were the fields to resort to. He said that the amount of iniquity was very great as regarded that indiscriminate grouping together of females in agricultural labour. He questioned very much whether there was the same amount of innocence and harmlessness now that there was in the days when Phillis and Corydon courted together. He believed that there was more prostitution and more illegitimacy caused through that system than any other. He left primary education in the hands of others. He believed it had been the subject of such diversity of opinion that he would leave it. He merely referred to the other subject, which he considered an important one. He thought that if farmers would really refuse to employ females they would be obliged to devote themselves and employ their energies in other things, and they would get better servants, better wives, and better mothers. The wives now not only neglected their husbands, but also their children. He had known instances in which children had been locked up in the house whilst their mothers were gone to work in the fields. There they came to all sorts of grief and harm, and besides, the household duties were neglected.

Mr. MANFIELD could not agree with Mr. Green, that the present defective cottage accommodation was easily remedied. How was it to be done in a place like Ixworth? The owners would not do it. He thought they must all agree that the daughters of agricultural labourers required such an education as would fit them for after life. They must, at least, be good sempstresses, and possess the qualification for good domestic servants. He entirely disagreed with Mr. Taylor's remarks as to the employment of women in agriculture, and quoted Mr. C. S. Read's opinion in support of his argument.

Dr. SHORT stated that he could speak from his experience of the parishes in which he was poor-law medical officer, that the women who went out to work in the fields were the most untidy, and their homes the most uncomfortable. In seven out of eight cases, where the women worked out, this was so.

Mr. FISON disclaimed the idea that seemed to prevail amongst the speakers, that it was a general thing to employ mothers of families in the fields. It was the exception rather than the rule.

Mr. F. GAYFORD said women did not go out so much now as they did. They had not half-a-dozen women, out of a population of 350, who would go into the fields to work. If he now wanted female labour, he was told the women did not go out to work. He agreed with Dr. Short's remarks, that the homes of women who went out to work must be neglected.

Mr. MANFIELD asked if the opponents of female labour objected to gleaming? He said if field labour did not hurt them then, it could not at any other time.

Mr. TAYLOR rejoined that his argument was that the supply of domestic servants was bad. They expected labourers' daughters to be practically educated, and he asked how that could be done in the fields.

Mr. S. W. HUNT, the Vice-Chairman, said he recollected when he was a boy that girls used to go into the fields, and used to do a great deal more labour than they did now. Servants of that day were a different class of people from what they were at present. Farmers' wives and daughters did not mind work, but at the present time the question was whether they could get servants to work. What he maintained was this: unless the mistress of a household knew how to set a servant to work, they could not expect to get a

good servant. He thought that if they had more milk pails and fewer music stools, they would be better off. Speaking of what had been said as regarded immorality, he said there was not so much immorality in the country as there was in towns. A town was the hot-bed of immorality, the hot-bed of illegitimacy, and statistics would bear that out.

Mr. BOORY said he could not agree with all Mr. Hunt had said. That gentleman seemed to think that farmers' wives were to supply all the servants that were wanted in the country, and that tradesmen's wives should know nothing but how to please their husbands.

Mr. GAYFORD, in reply, suggested that many persons might do good in taking a little girl into the house to assist the other servants, so that she learnt a little from all, and was trained to be a very useful servant in that way. To show that there was something in it, he was prepared—if the Club would give a guinea, for a medal or something of the kind—he would give a five guinea cup to the daughter of the farmer of about 150 to 200 acres who made the best pound of butter or the best loaf of bread. Let it be kept by the winner who took it three years in succession, and let the winner at the time have also a medal or something to commemorate the event. He thought that was most important to young farmers. Perhaps when the first cup was won some gentleman would give another.

The VICE-CHAIRMAN said he should be very happy to give the second cup then.

Mr. G. GAYFORD, alluding again to the question of field labour, said the mothers of very small children must lose more than they got by going out to work. Mothers, again, did not teach their children well by stopping at home, doing all the household work, and letting the children go out into the fields. He should like, before they left the room that evening, that they should arrive at some decision—whether they could devote anything from the funds of the Club to the object. If they could not do it in that way they might invite the ladies to co-operate with them, and ask them to form a committee amongst themselves. They might form a sort of auxiliary committee, and take an example from the one now existing. It was time something was done.

The CHAIRMAN thanked Mr. Gayford from the bottom of his heart for having brought that question forward. He (the Chairman) believed there could be no sound state of society without a religious basis. The labouring classes should be provided with proper dwellings. He considered that every one who had a young girl as servant, had a trust committed to him, and was bound to do his best to see the girl properly trained, and not look upon a girl as a mere machine out of which they should get the most work they could. Having alluded to home comfort as a necessity for the labourer as much as any one else, the Chairman proceeded to say that the present settlement of the education question was a mistake. Education without religion was like a ship without a rudder. They had heard a great deal of the want of parental control. They knew that boys must go early to work. It was essential that they did so. It would be impossible for the parents to support all their children unless they went to labour. As soon as they earned about an equivalent to their board they

began to be very independent. That was not confined to the agricultural classes. It was the same in higher classes. A young man did not call his father his "father," but he called him his "governor" (laughter). They all knew that from the age of 13 to 14, when the boy went to earn wages, he was under no control. It was very often the case that on Sundays they went to no place of worship at all. They met them in twos, and threes, and fours and fives, standing about as idlers, and so they went on, till they were grown up or got married and settled. They ought to do their best to put them in the right path, and if they were put in the right path when they were about 20 or 21, there was every prospect of their going right. To go back to what was the object of their meeting—the question of teaching girls. Women did not go to work as they used to do; there were more demanded for good servants. This was only to be done by each person who felt a responsibility endeavouring to teach them. They could not expect that without good teaching they would be capable of fulfilling the duties. He hated pauperism. He hated helping people who would not help themselves. Let them not turn their backs upon those who had fallen into error. Let them try them again. He had known many a generous heart beat under such a breast. As they would hope to be tried themselves let them try others; try them again and again, and then there might come a time when they might see that it was really useless to help them. But let them not turn their backs upon them the first time.

Mr. GAYFORD, in answer to the Chairman as to some practical means of carrying out what he had spoken of, suggested that in class 1 they should offer a prize for the best shirt made by a girl above fourteen and under fifteen—say three prizes of 15s., 10s., and 6s. In the second class let the girl be under fourteen, and give the same prizes. In class 3 he proposed to embrace clothes-mending and darning of stockings, giving as prizes 10s., 7s. 6d., and 5s. Darning he took to be a most important matter. He knew of nothing more uncomfortable than wearing badly darned stockings. The candidates, he suggested, should all be recommended by a member of the club, and should produce a certificate from the mistress, the minister of the parish, or the wife or daughter of some member, setting forth that the work was done in the presence of the parties recommending, or at least that they believed it to be all the candidate's work.

On the suggestion of the Chairman, the subject was referred to the committee to consider, after it had been suggested that the club should find materials, a suggestion, however, that did not find favour.

Mr. MANFIELD suggested that prizes should be given to domestic servants. He thought that must have escaped Mr. Gayford's attention. He would propose a vote of thanks to Mr. Gayford for his paper.

Mr. FISON seconded it.

Mr. GAYFORD, alluding to the offering of prizes to domestic servants, said he had not forgotten it, but he did not consider that it came within the province of their discussion. That would be for a future time.

A vote of thanks to the Chairman closed the proceedings.

NEWCASTLE FARMERS' CLUB.

THE RELATION OF SCIENCE TO AGRICULTURE.

At the last meeting, Mr. G. H. Ramsay in the chair, Mr. STOCKLEY read the following paper:

It has been a frequent subject of remark and a matter of surprise to many inquiring minds that agriculture, considering its antiquity as an occupation for man, and its paramount importance to the well-being of the whole human family, should not have partaken of the same rapid development as has attended the progress of physical sciences. It will be the object of this paper to point out some of the drawbacks that have crippled its progress, until at last we find it taking a foremost place among the scientific pursuits of our times, and thence, starting from the time when practical philosophy and erudition came to the aid and service of agricul-

ture, to follow up our observations of the striking episodes in its history that modern times have witnessed. Let us take a retrospective glance through the dim vista of unrecorded centuries in this island—when our wild predecessors roamed in savage freedom through the forests and fens, and over the wild moorlands of ancient Britain—far back for full forty centuries from our time, and we can, in the records of old mystical Egyptian civilization, find evidence of an agriculture flourishing under the Pharaohs, with which that of this country, down to the middle of last century, would have borne but poor comparison. Taking as our warranty for this assertion the scriptural proof we have of Egypt being the granary of all the surrounding countries, and the silent but striking evidence of the

implements of husbandry depicted on the walls of her temples and tombs, we may there recognise the birth place of agriculture as an art, eoeval with that of the sciences of astronomy and geometry, and long antecedent to the rise of fine art in what we now call ancient Greece, or to the Arabic invention and Saracenic development of algebra and mathematics, the very foundation and keystone of the exact sciences. It is then comparatively as yesterday that our Galileos, Keplers, and Herschels, our Priestleys, Faradays, and Davys, our Watts and Stephenson began their labours, and yet see, on every hand, the astounding progress that has occurred in the sciences of astronomy, chemistry, and mechanics. Take, for instance, the fact that this very week we had supplied to our breakfast-tables news, that only a few hours previously had been committed to the electric wires in India and flashed through seas and over mountains for many thousands of miles, to tell us that our *seavants* had succeeded—by means of the spectroscope—in solving some knotty points in natural philosophy, by measuring and analysing phenomena in connection with the recent eclipse of the sun, although occurring at the inconceivable distance from their point of observation of 93 million of miles! Why, then, or to what causes, are we to attribute the stagnation attendant on, and tardy development of, agriculture—the first-born of the arts—through ages in which the discoveries and scientific progress we have alluded to were never even dreamt of? Let us, in explanation and answer to this query, and limiting our view to England, look back for 1,300 years, to the time of the Saxon invasion, and we find such solutions as these: Gildas, a learned monk of Bath, writing about the year of our Lord 530, says: "From east to west nothing was to be seen but churches and houses burnt and destroyed to their very foundations, and the inhabitants, extirpated by the sword, buried beneath the ruins." Again, the Venerable Bede, writing from his cell, and, mayhap, the chair at Jarrow so familiar to us north-countrymen, says: "Britain was so ravaged by the conquering Saxons that there seemed to be a continual flame from sea to sea, which burnt up the cities and covered the surface of the whole isle. Public and private buildings fell in one common ruin, and nothing but destruction and dismay prevailed." After these times had passed, and when the people in the course of 600 years had become thoroughly Saxon, and agriculture had somewhat progressed, came the Norman Conquest; and when, after a terrible struggle, these new invaders had subjugated the country, its state in 1147 is thus described by William of Malinesbury: "From York to Durham there remaineth not a single inhabited village (and most of these had all been agricultural centres) and the whole face of England presented a scene of wretched devastation." Multitudes, afraid to remain in their own homes, built themselves huts in the churchyards, trusting to them as a sanctuary of refuge, and here, after subsisting for a while on roots, herbs, &c., died by holocausts in the pangs of hunger. It is easy, then, to imagine there could be no progress made in such times, and it is not till about 300 years after them that we find even a book of any importance bearing on the subject of husbandry. There was one published by Sir H. Fitzherbert in 1534, which, after epitomising all that was known on the subject, went no further. We then pass through an age where guesses and dogmas such as the following were prevalent as positions of the principles of vegetation. About 1600 A.D., Sir Hugh Platt says: "I find a double fatness in every compounded body—the one combustible and the other incombustible. The combustible fatness causeth vegetation by its vivifying and vapouring qualities, and of these two fatnesses all riches and treasures are engendered. For there is no difference of dung, but as the astringent, incombustible fatness doth overmatch, or is overmatched by, the combustible, so it is more or less adapted for hot or cold ground." This is sufficiently abstruse, but certainly somewhat obscure. We then have a gradual improvement upward till the time of Davy, when for the crude ideas in the application of chemical science to agriculture hitherto held, was substituted true and demonstrable philosophy, opening out a field of research and inquiry that has engaged the best efforts of some of the master minds of the last and present generation. Then followed improved agricultural mechanism, crowned by the application of steam as the motive power, and we have now a combination of practical and theoretical skill at work in the interests of the masses, which has so rapidly expanded and altered the art of cultivation as to give rise to the hopeful expression, "Notwithstanding all that has yet

been done, agriculture is still in its infancy." If this be true, it affords a cheering prospect to those who—looking on agriculture as a profession—see full scope for all their energies and powers of observation, coupled with a fair chance of substantial reward for every judicious and well-matured step in advance. And not less so to others engaged in more strictly scientific pursuits, but who, perceiving an almost fallow field for the conjoint labours of the husbandman, chemist, and mechanic, have turned their most earnest attention to the task, and continue to apply all their energies to this vast arena of competitive improvement; and with what success let the gigantic establishments of our world-famed implement makers, and the acres covered by their production at our periodic shows, bear witness. In his now celebrated lectures before the members of the first Board of Agriculture in 1802, Davy enunciated his new theory containing the fundamental principles upon which the chemistry of agriculture is founded—*i.e.*, "The conversion of inorganic bodies into gases, and the assimilation of gases by organic bodies." Vegetables derive their component principles, which for the most part are hydrogen, carbon, oxygen, and nitrogen, either from the atmosphere by which they are surrounded, or from the soil in which they grow. The process of vegetation appears to depend upon the perpetual assimilation of various substances to the organs of the plants in consequence of the exertion of their living powers, and of their chemical affinities. We have now arrived at a point where the words chemical affinities warn us that an exact science has to be dealt with, in so far as it relates to our theme, and we cannot, with any degree of lucidity, perspicuity, or profit, go further without a familiarity with the first principles of chemistry upon which our future clear comprehension of its operations in vegetative processes will depend. As these papers are specially addressed to those who have not studied the subject to any extent, we shall avoid any attempt at recondite dissertations on chemical action, or the use of puzzling nomenclature, while endeavouring to draw our illustrations, as far as possible, from the familiar objects by which the tiller of the soil is surrounded. In all the multitudinous objects by which we are encompassed, our rivers, rocks, and seas; our atmosphere, animals, plants, forests and fields; in short, in the whole economy of nature, we see but few primitive elements, or bodies having a composition of their own, the endlessly diversified appearances and attributes of matter being traceable to their source from the now ascertained comparatively few elementary bodies. These, under the subtle and wondrous power of chemical affinity, act and react upon each other and their mutual production in endless diversity of election and combination, and so evolve the material from which our globe, with its infinitude of wonders, organic and inorganic, solid, liquid, and gaseous, is composed. In the early history of chemistry, while it was fettered by the dreams of the alchemists (but to whom much is due as pioneers in the science), or when, unfortunately, it was perverted to the abuses of empiricism and designing charlatans, and even down to our own time, hundreds of bodies were accepted as elementary substances that have, since the time when chemistry took her place among the exact sciences, been relegated to the list of compounds, and still her votaries continue constantly by their researches to reduce the number. Looking at our subject from an agricultural point of view, we shall not need to deal with more than about 17 or 18, as necessary for admission to the laboratory of the scientific farmer; and these are, oxygen, carbon, nitrogen, hydrogen, chlorine, silicon, phosphorus, magnesium, sulphur, calcium, potassium, aluminium, sodium, iron, manganese, bromine, fluorine, and ammonium, this last being a compound body, but doing duty as an elementary one. These bodies, then, when brought into contact with each other in certain definitely fixed proportions of weight or volume, and under certain circumstances of temperature, fluidity, or other necessary conditions, exhibit the action of affinity by combining, or, as it were, actually entering into each other, the resultant compound or compounds generally being totally different from the parents elements and from each other, in every characteristic of weight, volume, colour, form, smell, and taste, in fusibility, volatility, solubility, and, in fact, every property of matter. The act of combination is generally attended with the production of heat, detonation, ebullition, or crystallisation. A very familiar and common chemical experiment serves well to illustrate the foregoing remarks. Suppose that of the two invisible or

elastic gases, oxygen and hydrogen, the first a most wonderful supporter of combustion (observe this quality), and the second the lightest substance known to exist (an equally distinctive feature of remark). Supposing we take eight parts of oxygen and one part of hydrogen, and mix them together in these proportions, no matter whether in ounces or tons, they will theoretically remain tranquil, invisible, and innocuous for ever, if kept below the temperature at which they combine and form another substance. But apply a red-hot wire or lighted match to the mixture, and with lightning rapidity every one part of hydrogen selects its eight parts of oxygen—neither more nor less—and *vice versa*—flash into each other with such inconceivable intensity as to cause an explosion and loud report, and instantly form a compound of exactly the previous proportions, but diametrically opposed to every quality possessed by them—namely, water, an incompressible, visible, fire-destroying element, born of and preserved in that form by the laws of affinity. We may again with this very water reduce it to its original constituents as follows, and permanently separate them: Put the water into a boiler having an iron outlet pipe filled partly with iron filings and passed through a fire so that this part become red hot. Then boil the water which passing off in the form of steam and vapour, is, on its way through the pipe and filings decomposed or reduced to its primary gases; but the oxygen having a stronger affinity for the iron than it had for the hydrogen, parts company with the latter, and enters into the iron, forming oxide of iron, or common rust, just as it is doing every day on the unprotected ironwork of your homesteads (only in this case it is deserting the nitrogen of the air), and the pure hydrogen passes off at the end of the pipe where its presence may be demonstrated by applying a light, when it will ignite and burn with a pale yellow flame, taking back oxygen from the air and again producing water. If the iron pipe and filings were weighed previous to and after the experiment they would be found to be heavier by exactly the previous ascertained weight of the oxygen they have absorbed, so beautifully true and unerring are the laws governing chemical transmutations. Again, we may have evidence of mere contact bringing about instantaneous combination, by taking a piece of the metal potassium, the base of potass, and merely dropping it into a saucer containing cold water, when the potassium will seize and combine with the oxygen of the water so fiercely as to burst into intense combustion, until the potassium has gorged itself with oxygen and is presented in the new but familiar form of oxide of potassium—the potash of commerce. The very same action, but with a lesser evidence of intensity, is what you see going on where the simple clod of lime, falling from the cart into a pool on the road, exhibits a vigorous chemical combination going on by mere contact of two cold bodies, one liquid and the other solid, and producing heat and a new resultant compound. These are illustrations of affinity in its simplest form, but it presents more intricate attributes in what is called elective affinity—single and double—and I may here adduce an instance where the exercise of the first-named would be productive of a dead loss to the farmer. Sulphuric acid and ammonia unite easily, and form sulphate of ammonia, largely manufactured from gas water, and forming a well-known chemical manure. Now these two elements are in this form quite satisfied with each other, and ready to serve the farmer a good turn while fairly treated; but let them be brought (as may easily happen) into contact with lime, when straightway the fickle sulphuric acid transfers its affections to the lime, and the ammonia flies off in disgust. This has been brought about by the exercise of elective affinity, where the acid, although previously in combination with ammonia, has another body, for which it has a stronger affinity, thrown in its way of choice. Another example will illustrate the operation of double elective affinity. Suppose we go to a steaming manure heap on the farm, where carbonate of ammonia is being wastefully given off from the decay or slow combustion of the matter composing it. The carbonate of ammonia being of a volatile character, will, if uninterfered with, wander off into the atmosphere in search of “fresh fields and pastures new,” where it will be deposited by some shower of rain washing it down; but the probabilities are, that will happen beyond the boundary of its birth-place, and for some one else's benefit. So, to prevent this consummation, let us give the manure heap a good dusting of gypsum or sulphate of lime. Now this is composed of sulphuric acid and lime, while the carbonate of ammonia is composed of car-

bonic acid and ammonia. Directly they have the opportunity presented them to exercise their elective affinities, the carbonic acid leaves the ammonia, and, as it were, crosses over to the lime, while the sulphuric acid of the gypsum does the same to the rejected ammonia of the carbonic, and thus brings about a complete change; the acids and bases changing places with each other; and, what is more to the purpose, presenting the farmer with his once volatile ammonia now fixed in the form of sulphate of ammonia—the very compound already spoken of in the foregoing instance. Thus we see how a knowledge of even elementary chemistry may be not only a subject of interest and inquiry to the observant agriculturist, but that he may turn to profitable account that knowledge which, wielded by the analytical chemist, enables him to detect to infinitesimal degrees the presence or absence of any individual ingredient in any given compound. Seeing, then, that all the operations of the agriculturist—the growth, structure, and food of the plants—whose perfection his labour, anxiety, and capital is expended upon—are regulated and subjected to the laws of which chemical affinity is one, if not the most important, it will perhaps be admitted that a little time devoted to their study will not be lost. If in this case my audience endorse the hope thus expressed, my endeavours on this occasion will not have been unsuccessful.

The SECRETARY, Mr. Hugh Stephenson, said he endorsed Mr. Stockley's remarks, and quite agreed with him as to science being of great importance to agriculturists. He was, to a certain extent, acquainted with the science of chemistry; he was educated as an agricultural chemist—at least he had done a great deal in agricultural chemistry, and had found great benefit from it. He was sorry that farmers at large did not take the interest in chemistry that they really should; a great many of them ignored it, and thought it really of no avail; but if a farmer—he did not care whether the man was 30 or 40 years of age—would only look up the elements of chemistry he would find that it put pounds into his pocket every year. Science could not do entirely by itself, especially chemical science; it must be combined with good practical knowledge. A man must be a practical farmer before he takes up chemistry. He wished to throw his small weight into the remarks of Mr. Stockley, for he could bear out what he had said, as he (the speaker) had proved it by experience.

Mr. HENDERSON believed that the science of agriculture would be better understood and carried out in future years than it was now. He congratulated Mr. Stockley on the very able paper he had read, and he trusted it would be profitable to them.

The CHAIRMAN said the paper had evidently been written by a gentleman who understood a great deal more than some of them in that room. It could not be expected that the great bulk of agriculturists in this kingdom could be all chemists; but the agriculturists were now assisted by all the first chemists in the country, in one shape or the other; but that would not prevent young men from cultivating their understanding, and such papers as the one read by Mr. Stockley were one of the great means of giving knowledge and information on the matter. He did not think exactly with Mr. Stockley, that agriculturists were so far behind; but still he thought they might be far more in advance. They did all they could in such places as that club to spread useful information; and they were delighted to find gentlemen like Mr. Stockley come amongst them from time to time, and to show them, in the nice condensed way he had, the great value of chemistry to agriculture. If they could go on better he should be very glad indeed; but he feared they would never be able to approach the subject in the way their friend, or analytical chemists, could; but they were doing what they could. They were extremely indebted to Mr. Stockley and other gentlemen who came forward. He thought such clubs as that deserved some credit for what they did towards improving the information of their members; and, taking all things into consideration, he thought agriculture had made very rapid progress indeed. If Mr. Stockley's paper was printed, they would have an opportunity of reading it over, and he could say that he had not heard many better papers than that of Mr. Stockley's.

Mr. WALLACE said they had had a very able paper read, and the discussion had hitherto been as to relation of chemical appliances to agriculture. The heading of the paper, however, was “The Relation of Science to Agriculture.” If anyone

looked back to some of the dates Mr. Stockley had referred to, they would see and admit that agriculture had made the most rapid strides of any profession or calling that existed. If they looked back three hundred years to the mechanical appliances then connected with agriculture, they would find that improvements had since then made monstrous strides; and if they looked back only to the days of their great grandfathers, they would be astonished at the improvements which had been made in the mechanical department of agriculture; and he believed they would see still greater improvements before some of the young men present reached the age of three-score years and ten. He believed they would live to see steam-power used on almost every farm in the country. As to chemistry, it was very much to be regretted that every young farmer did not give more attention to that branch. He himself had felt a great want indeed in not being able to bring the science of chemistry to bear on agriculture. He would only be too glad if this paper, and the exertions of this club, brought before the young farmers of the north the fact as to this deficiency in chemical education. The more chemistry was brought to bear on agriculture, the more would agriculture be benefited by its application. He hoped Mr. Stockley's paper might be printed, and he trusted farmers would endeavour to be benefited by it.

Mr. ANDERSON agreed with a great deal of what Mr. Wallace had said. He thought that agriculture in England stood higher than in other countries, and especially as to agricultural implements. He remembered the day when a thrashing machine was rather a novelty, and now it was found a perfect necessity in every establishment. It was only recently that efforts were made to make reaping machines, and they had now become a perfect success, and were most important in regard to getting in the crops in England. Instead of having as formerly, a batch of Irish labourers, who had to cut the

corn whether wet or dry, the farmer had a machine which would cut any quantity of corn, and cut it in dry weather. Their drills and haymaking machines were now as nearly perfect as possible; but it was different in some European countries. He had seen a horse treading out the hay by merely walking over it; he had seen that in Italy, where they were doing it exactly as it was done in the days of Abraham. He thought there was some chemical knowledge required in connection with agriculture. They had now the opportunity of having an Agricultural College in their neighbourhood. At Haydon Bridge there was a school, which, it was contemplated, might be made of great advantage to farmers' sons. The highest class of education was well attended to, and the lowest was now likely to be attended to; but the middle-class seemed to fall through, and the sons of farmers seemed likely to be less educated than other classes. He would be glad to see the contemplated college at Haydon Bridge succeed; and if it was supported by the farmers of the county there would be no doubt of its succeeding. He concluded by moving a vote of thanks to Mr. Stockley for his able paper.

Mr. BELL (Newcastle) seconded the resolution. He was very glad that they had heard a lecture of this sort, because he believed it was the best way of communicating information. Farmers' sons, he believed, were improving in their education; at all events, they could read and write well, generally speaking; and if they could do that, then they had information very near at hand in the weekly and daily newspapers which were circulated and read in the county.

The resolution was unanimously agreed to.

On the motion of Mr. J. POTTS, seconded by Mr. HEWISON, it was agreed that Mr. Stockley's paper be printed and distributed among the members of the club.

THE COGGESHALL AGRICULTURAL SOCIETY.

At the annual dinner, after the ploughing match, Mr. F. U. Pattison in the chair,

Mr. MFCIN said: I have always had a great affection for Coggeshall, and for this institution in particular, because I have always received from the members of it, under every circumstance, the most marked indulgence, and when opposition, perhaps, might be expected, it has always been qualified by an excellent personal and kindly feeling. And I look upon that as a very wise course of conduct, because if you exclude personalities from such institutions as this you are sure to prolong their existence. You cannot destroy an institution of this kind more quickly than by permitting personalities to be indulged in. We are met, gentlemen, for a great and a good object. It is to encourage the labourer in good habits and in proficiency in his occupation, and altogether we must look upon these assemblages as tending very much to improve British agriculture. You know I am getting an old man ("No, no.") Well, I am 70 next May. In my early days there were no Farmers' Clubs, and no institutions of this character. But I believe I have had the pleasure of attending this meeting now for more than a quarter of a century, and I recollect perfectly well, when employment for the labourer was very difficult to obtain, I saw your prize given for digging. I estimated the time by my watch that it took to dig a rod of ground, and I went back to my farm and had 50 acres of land dug, as a means of employing the people and making profit for myself, at the small charge of £1 6s. 8d. per acre, or 2d. per rod. I found that the men, instead of going to the union-house in the months of November and December, were willing to earn those wages. Times have improved since then or money has got cheaper. At all events I could not have that work done now for less than 50 per cent. increase. That was one good that was derived partially and principally from my visiting this institution. Now we come to a very important question: How can we make farming more profitable—more profitable for the tenant farmer, for the labourer, for the landowner—because they must all go together—and more beneficial and profitable for the country at large? That question is receiving a solution, for the great and interesting feature of this year, agriculturally, has been the trial at Wolverhampton

of the steam ploughing engines, and if you would all read attentively the voluminous report of the judges at those trials, it would convince you, as it has convinced me—if I had any doubt about it—that we must look to the employment of steam power for the future increase and profit of agriculture. There are great impediments to that in the county of Essex. One of the first is that farmers don't understand steam and don't like to face the trouble of having it on their farms. I do not refer to thrashing machines, brought to them to be hired, but to the very advantageous condition of having a fixed engine on the farm for the ordinary purposes of the farm, irrespective of cultivation. I have had one for 24 years, and our people on my little farm of 170 acres would say they would not know how to get on without it. What strikes me as very extraordinary is that plenty of rich farmers—for there is plenty of money in Essex—Mr. Beaumont and Mr. Barnes and other gentlemen of the law know that what strikes me as extraordinary is that these rich farmers don't try the experiment. But the explanation, I suppose, is that the having a fixed steam engine on the farm is a new event, because it entails a new arrangement of ideas, it is different from the shoeing your horses and having your harness mended, and different from the ordinary work of a farm as it has been hitherto carried out. I believe that is the reason that it is not more generally adopted. It ought to be adopted. I see farms of four, five, and six hundred acres which never ought to be for an hour without their fixed steam engine—that is, quite irrespective of steam cultivation. Well, now we come to steam cultivation. Among the impediments are the size of the fields, the incumbrance of trees, and the incumbrance of fences. It is impossible to come from London on this line of railway without being struck by this fact, that small as the fields were originally a vast number of them have been intersected by the railway and cut into halves or into thirds, what was a great evil before being thus rendered still greater. That is a question for the landowner principally, and next for the landowner and tenant combined. I hope and believe that the landlord will find it will be for his interest to give permission to abolish those fences, to do away with those trees, and put the land into such a condition that steam cultivation

can be brought to bear upon it. Another thing too must be done—if the land be heavy and wet it must be drained before you attempt to steam cultivate it. There are some very interesting facts in connection with steam cultivation. Some companies have been formed in Yorkshire, in Northumberland, and in other parts, with capitals of from £20,000 to £40,000 invested in steam cultivation to do the work by contract for the harvest. But you must bear in mind, gentlemen, that in the district in which they are working the fields are 20, 30, or 40 acres each. They could not profitably do it in certain parts of Essex on the same terms. But there is another very great obstruction in Essex—the engines could not cross your rivers, for on every bridge a notice is stuck up that no heavy machine is to go over it. No doubt that is proper, because, as was the case at Battles Bridge, the structure would fall in, and so would the engine; and when I wrote to Mr. Edgington to say that I wanted some steam cultivation, he replied, "My machines are in Cambridge-shire. I should be willing to come to you but I cannot. The bridges will not carry our engines." I must here appeal to our magistrates to feel the pulse of the county and see whether it will be much longer permitted that one of the most interesting and profitable operations of a farm is to be rendered unavailable, simply because the bridges are not put in suitable order. I have that opinion of Essex that a rate would not be objected to and that the magistrates will find they can freely make the necessary alteration. But, gentlemen, do you know what is doing in regard to steam cultivation? I have taken great interest in this question. It is now 15 years ago—for it was in the year 1856—that Fowler's steam plough was first brought on to my farm to plough the subsoil, and some of you, gentlemen, I suppose, must have seen it. But look at what is taking place now. An acquaintance of mine in Berkshire has four steam engines of 30-horse power each. Last year he succeeded in cultivating to a depth of 30 inches, but this year his cultivation is a yard deep. That is a very serious question. He is not a small farmer, for he has 4,600 acres of land of his own which he farms. I believe he has been wise not suddenly to bring the bad soil to the top, but when I tell you that last year he grew many acres of sugar beetroot for the purpose of making brandy it shows you, I think, that there is something going on in British agriculture. It is clear from the facts that come before me that the cheaper class of engines are the most costly and the least powerful. I mean the work can be done cheaper by a 20-horse engine than by a 10-horse engine, although the price may be so much larger at first. I was told the other day that one of Mr. Fowler's first customers who bought an engine of him for £1,500 some 14 months ago, as a practical farmer has now bought another for £1,500, and it is not an uncommon thing for a man to buy two engines at a thousand pounds each as the cheapest way of cultivating his land. I will give you an instance. The evidence we had in the course of the Wolverhampton trials showed that one pound of coal in an engine moved nine tons of earth. That alone ought to teach us that steam as a power is infinitely cheaper than horse flesh. A horse can lift another horse, or perhaps two, but a pound of coal will lift nine tons of earth, or put in a pumping engine it will lift a million pounds weight of water and lift it a foot high. I say that if we as farmers do not take the cheapest power, if we do not give up our prejudices in favour of our old customs, we are not quite sensible men of business. I am not quite so sanguine as to suppose the changes are to be very sudden. We know that in the Rochford country, where fields are large, Mr. Carey has several sets of machines, involving an expenditure of several thousand pounds, and lets them out to the farmers. But there is one point I would call the attention of our landowners to. Three years ago the Duke of Northumberland had a conference with his tenantry, through his steward, with the view of getting to know whether they would like to join in a steam ploughing machine on certain conditions. These conditions were that his lordship was to buy a 12-horse power engine of Fowler's, at £1,500, they then calculated how much would be the wear and tear and how much could be charged to each for the use of the machine. The agreement was made and this was the result, that the tenants had their land ploughed at 10s. an acre; it was then cultivated very deeply the next time at 5s. an acre. If it was cultivated a second time after the first cultivation and the ploughing the charge was 2s. 6d. an acre, and the harrowings were 1s. 6d. per acre—not such harrowings as we have

with three-inch teeth—but with machines of 12 and 15 inch teeth. That has been satisfactorily at work for three years. The Duke of Northumberland receives five per cent. interest on the money invested; the machine is kept in perfect order, with a reserve to buy a new one. There was a little difficulty as to who should have it first, and a very wise arrangement was come to: that was that the man who first cleared his 30 acre field and gave notice was to have it, and the next in rotation and when it became an even question they should draw lots. In that way it has worked extremely satisfactorily; it has been the means of largely increasing the farmers' profits, and I need not tell you has been a great benefit to the country at large. I don't know whether you are aware how many engines there are in this country. I am told there are 10,000 locomotive engines running and 200,000 steam engines employed in making our clothes and other necessaries of life. I say that agriculture must take the lead a little more than it has done. We are all inclined to get a little more profit. I don't know a better farmer than our excellent friend Mr. Catchpool. He has laid his fields open, and what I want to see is that his landlord should make him a covered yard in which to feed his cattle and charge him five per cent., and that he should have also a fixed engine for doing his work. I look upon Mr. Catchpool as one of our best farmers, for the reason that he maintains the fertility of the soil. Cow farming generally is a robber of the soil, but the way in which Mr. Catchpool treats his cows enables him while he is milking them to be also fattening them. He feeds them with cake and grains, and at one and the same time is finding milk and meat for the people, besides making the land grow plenty of corn. I have to apologise for taking up so much of your time. I can only say if everyone of you gentlemen should procure a fixed engine, the comfort and the profit would be such that having once got it there would not be a man upon your farms who would say you ought to do without it. I thank you for drinking my health. I shall go on as long as it pleases God to spare me to point out our weaknesses. I believe we effect good by doing so, and it is therefore that I do it.

Mr. BEAUMONT, as an old member, had great pleasure in proposing, at the call of their esteemed chairman, "Success to the Society," and with that toast he would couple the name of a gentleman who had invariably been willing to place his farm at the disposal of the committee for the agricultural competitions. He alluded, as they all knew, to Mr. E. Catchpool. He was exceedingly pleased to hear one more competent than himself (Mr. Meech) say kindly and good things of him. He was especially glad to hear them from Mr. Meech, because he knew that if Mr. Meech could take the farmer to pieces, or stick his arrow into him deeply, he would most certainly do so.

Mr. CATCHPOOL said Mr. Meech had spoken on the topic of steam cultivation. He, as a farmer, wished that gentleman could have said something about Tenant-Right, for he held that it was of no use a man improving the land he occupied to a great extent if, at the expiration, perhaps, of a 14 years' lease, the landowner was to come down upon him and say, "Your land is of very much more value and you must pay an advanced rent." The tenant, in that case, not only had to find the money for the improvements, but had also to pay a large interest upon it in the shape of increased rent. He quite agreed with Mr. Meech, generally, that keeping a large number of cows impoverished land, but at the same time they must remember that from March to November people's yards were empty. Many of his friends were in the habit of feeding their 50 qrs. of grains per fortnight, which were imported on the farm, and he could not but think it must increase the value of the farm to some extent.

Mr. DENNIS, the vice-chairman, wished to make one observation in regard to what Mr. Meech had stated about steam cultivation. He quite agreed with Mr. Catchpool that the terms on which farmers held their leases did prevent them in a great measure from laying out so large a capital on the land as they otherwise would do. There was great insecurity of tenure even upon good estates, because life was very uncertain, and there were not always children to inherit the farms of their fathers. Farmers were never paid for what they laid out, and their children did not reap the benefit, and it was not altogether a matter of surprise, therefore, that there was not the money laid out in agriculture there ought to be. He felt convinced that if they farmed lands which they could occupy for a long series of years they could make them produce nearly

double what they did at the present time. He was not going to bring any charge against landowners, because they had their interests and farmers had theirs. [A VOICE: "They ought to be identical."] He could not help thinking that farmers were very badly represented in the House of Commons. They had very good representatives so far as landlords were concerned, but what had been done for farmers in the House of Commons for many years past? He was only aware of two important measures. One was to make rabbits game, and the other to do away with the last shilling on the corn, throwing a million of money away which might as well have been in their pockets now. The tendency of Parliament seemed to be to impose no duties on foreigners, and put them all on the farms of the country. With regard to the Malt-duty, he was not an advocate of doing away with it, because he believed the Government could not afford to give it up, but whenever the Malt-duty had been brought forward Parliament had always beat about the bush instead of going right to the heart of the question as they ought. Why did not Government reduce the Malt-duty as they reduced the tea-duty, in such a way that they could recoup themselves by increased consumption? In reference to the insecurity of tenure, Mr Gladstone gave Ireland a land bill. Why did he not give the farmers of England a land bill? Had they not been as faithful to the throne, and as anxious for the welfare of this country? Perhaps, indeed, it was on account of their loyalty that so little was done for them. He did not care what Government we had, Mr. Disraeli's or Mr. Gladstone's. He was for doing justice to everybody, and he meant to say that the lands of this country would never be farmed in the way they ought until measures were passed to make the farmers' capital more secure on the land than it now is.

Mr. BARNES said the speech which had been made by so practical a man convinced him what he had always thought, that the land of this country had not been used to produce what ought to produce. In that case the farmers surely had, to a considerable extent, the remedy in their own hands, for if they could convince the landowners that by better cultivation they could make the land grow double what it now did, and were

willing to increase the benefit of the owner to a fair extent, they would have no difficulty in getting long leases.

Mr. HILLS hoped Mr. Barnes would be kind enough to tell the farmers how they were to lay their capital out with a fair prospect of getting a due return. They knew well enough that if more money were expended on the land it would yield more, but it seemed, according to Mr. Barnes's theory, that the tenant was to lay out all the money necessary for this and not to have the benefit of it. ["No, no."]

Mr. BARNES said Mr. Hills had mistaken him. He of course supposed that if the tenant could be secured in his tenancy, and could grow double the amount of produce he did at present, he would be prepared to give a rent in proportion to the yield. [A VOICE: "On whose capital?"] In part it might be upon the tenant's capital, but they must all know that the land of this country would never go down in its value. The tenant ought to be guaranteed a fair return, but the landlord had a right to have an increase from the value of his land commensurate with the value of the capital of the country. It was the farmers' own fault if they were not properly represented in Parliament. They had sufficient power, and if they only used it legitimately they might be fairly represented. They were certainly taxed for things they ought not to be, and it was for them to bestir themselves in this matter.

Mr. DENNIS said he had never contended for long leases. What he said was that if a man drained a farm and got it into a good state, after it had been in a bad one, he ought, whenever he left it, to be paid something for the improvement he had effected. He had two sons in New Zealand, and so unsatisfactory were the state of things in this regard that he considered it one of the greatest blessings they ever left the country. Looking to the quantity of foreign corn brought into this country, which of course must bring the price down, and to all the responsibilities which the agriculturist had to bear, it was impossible to farm land with wheat at £10 or £11 per load.

Mr. MERRI believed the feeling was that there should be a valuation of and compensation for unexhausted improvements made by the tenant.

BANBURY DISTRICT CHAMBER OF AGRICULTURE.

At the general meeting, the Rev. C. W. Holbech, the President, in the chair,

The SECRETARY said he had written to seventy-six Chambers to gain information with respect to chap-money, as requested by the last meeting, and he had not received very many replies, some of the Chambers waiting to have the matter laid before them before they sent an answer. The answers from the North of England—where the people were so sharp and shrewd—were that there was no such custom there, and the sooner it was abolished the better. The Newcastle Chamber had passed a resolution since he had written to the effect that it was desirable to abolish chap-money, and a general time should be fixed for doing so throughout England. A farmer at Bedford told him they had abolished chap-money with regard to corn, and on cattle it was only a penny a head. Mr. David Curror, of the Scottish Chamber of Agriculture, said there was no such custom in Scotland with regard to sales of grain, but of horses and cattle, and they did not think the practice so vicious as to call for interference. The West Suffolk and Norfolk Chambers wrote that the custom was not recognized in these counties, and the Leicester Chamber that they would shortly discuss it. He thought they should again adjourn the matter, so that he might get more answers, and lay the results before them in a tabulated form.

The CHAIRMAN: I don't think any of the Chambers wish it to be continued.

Mr. R. EDMUNDS thought the practice very objectionable, and they should endeavour to get it abolished simultaneously throughout the kingdom.

Mr. WESTOVER said that, while they were waiting for the decision of the various Chambers, those attending Banbury market laboured under very great difficulty, for a resolution had been passed and they were not able to carry it out. At the last meeting two resolutions were proposed, but not carried—

one by Mr. Dun, that pending any further action they should adopt the proposition of the millers; and another by Mr. Hadland that they should relieve those of their pledge who signed the paper. It was very important that this should be done, for it was impossible to do business without giving chap-money, consequently it put those who signed the paper in an unpleasant position. People must either not do business, or give chap-money. He would move the adoption of the motion proposed at the last meeting by Mr. Hadland, which was—"That in the opinion of this meeting, the change proposed with regard to chap-money, being only partial, does not work satisfactorily, and therefore think it expedient to release from their pledge all those who desire it; and if the Central Chamber of Agriculture will adopt the proposition, the support of this Chamber will be given to the movement in order that it may become general."

Mr. THURSBY seconded the motion. It seemed to him impossible to do away with chap-money unless it was universally done.

Mr. EDMUNDS: I think the motion a proper one, as gentlemen are placed in a very anomalous position at present.

The SECRETARY: If this motion is carried, we should not give up our point.

Mr. WESTOVER: No.

Mr. HADLAND said he proposed the motion at the last meeting merely to get out of the difficulty, and they found very great difficulty in the matter. Since the last meeting the greater part of the farmers had come in and agreed to give chap-money; but he thought there should be some resolution passed to relieve those gentlemen who felt conscientiously that they could not give chap-money, having signed the agreement. If the Central Chamber took it up, they could support them. He thought it should have emanated from the Central Chamber, because it was impossible to carry it out in one place.

The motion was carried unanimously, but it was understood that the Secretary was to get further information on the subject.

Mr. BRAZIER drew the attention of the Chamber to a matter he considered very important, especially to agriculturists. He viewed with considerable alarm a memorial now got up, and which would be presented to Parliament next session. There had been a permissive power in the hands of the Guardians to give superannuation to some of the officers—such as matrons, masters, and others engaged. There was a memorial to be presented to the House of Commons, from the Poor-law officers generally, for superannuation allowances, whether they were long or short in the service, if their health broke down, and they wanted a certain proportion of their salary allowed to them for life. It was not merely to include the master and matron, but to take in the clerk, in fact, to go through the whole staff—the doctors, masters, matrons, porters, relieving officers, nurses, &c., needlewomen in the workhouse or in any part of the union. During the last year there had been about eighty-two officers, in various parts of England and Wales, superannuated at a cost of nearly £3,000. The memorial that he referred to proposed that every officer should be entitled to two-thirds of his salary as a retiring allowance. When they considered how many thousand officers there were in this country, that they were breaking down every year, they would soon have a second race of paupers to provide for, and made so by Act of Parliament. If a proposition like this became law, he did not know what would become of them. He had taken the trouble to write two letters to the Banbury papers on the subject, but he had hoped that some gentleman better qualified than he was would have taken the matter up. He gave notice that he would bring the matter before the Chamber at its next meeting.

Mr. JAMES GRIMBLY: Have not the Guardians absolute power to veto any superannuation allowance?

Mr. BRAZIER: They have now, but they will not have if the Bill asked for passes.

Mr. WESTOVER said he would call the attention of the Chamber to the labour question. He would rather that the matter had fallen into other hands—into the hands of those who could speak with far longer experience than he could; but the question was one of great importance at the present time, and demanded their attention. It was a tenant's subject, and interfered with them very seriously; it was a proprietor's subject, because, as years rolled on, it must affect the value of their property; and it was a national subject, for if obstructions were thrown in the way of the agriculturists, it would curtail the food supply of the country, and they would have to depend still more upon the foreigner for their food supply than they did now. He hoped that when he brought the subject before them—and he trusted they did not think he did so to gratify any vanity of his—that there would be many practical gentlemen present, not to listen to him, but to give their attention to so important a subject.

The SECRETARY said he did not think they would be able to take both the subjects on the same day. They would take Mr. Westover's in February.

Mr. WESTOVER said he was quite willing it should be so.

It was here agreed that the next meeting should be held on the 30th of January.

Mr. EDMUNDS said there was one thing that he should like to bring before them, namely, whether anything could be done by that and other Chambers to strengthen the hands of the Government upon the beer-house question in villages. The Chambers throughout the country were moving in the matter, and if anything could be done to remedy existing evils they would be rendering the greatest service to the agricultural labourer. He did not think there was anything to legislate upon that would prove so great a benefit to the mass of the people than some better regulation of beer-houses. He had no wish to take up the question, but he would do so at some future meeting.

Mr. LITCHFIELD said he should be delighted to be present when such an important subject was to be discussed. He did not think he should introduce it, he was really so often before the public on the subject. He mentioned he had sent a notice on the subject for the agenda paper of the next Quarter Sessions at Northampton. He also said he was in the House of Commons when Mr. Goulbourn brought in the Bill that had caused all the evils they were now complaining of. He had the honour of Mr. Goulbourn's personal acquaintance, and

that gentleman told him that his bill would destroy liquor shops and public-houses; but he (the speaker) pooh-pooled it, and said it would double them. What he then said had proved correct, and for forty years he had been trying to get rid of the evils that it had brought about.

Mr. DUN said that there was hardly a question of greater interest to agriculturists. It was the greatest evil they had to deal with. In their villages badly-managed beer-houses were the greatest curse they had to contend with. They pauperised the men, made them blackguards, degraded and demoralised the children, and encouraged dirt and everything that was bad.

Mr. LITCHFIELD: And prostitute the women.

Mr. SAMUELSON, M.P., thought they could only deal with the economic view of the question.

The Rev. GEORGE MILLER read the following paper: As some of the turnpike trusts in our immediate neighbourhood have already come to an end, and as by the Turnpike Act of last Session many of the remaining ones will be dissolved during the next year, the following questions are naturally of great importance to the ratepayers: (1.) To whom shall the future management of turnpike roads be entrusted? (2.) Where shall the funds come from which shall be required for keeping them in proper repair? With regard to the first of these queries, it appears to me that where Highway Boards exist, the most efficient and least expensive plan would be to entrust to such boards the future management of the turnpike roads which pass through their respective districts. The Highway Boards possess the requisite machinery for the management of the roads in their districts, and the addition of some 10 or 20 additional miles of roads would require no increase of the staff of officials and only a small increase of the surveyor's salary. The chief difficulty in connection with this plan is, that the Highway Boards are not universally adopted through the country. The circumstances of such cases might be met by enacting that in those districts where there are no highway boards, local boards, somewhat similar to the proposed educational boards, should be formed, permission being given to those boards to comprise one, two, or three divisions of the hundreds of the counties, as might be determined by the magistrates residing within such districts, and the local surveyors of the different parishes; that to such boards the management of the turnpike roads passing through those districts should be entrusted. The expense of maintaining such boards need not be large; for the total expense of managing the Kineton turnpike road, though the length of road belonging to the trustees is under 12 miles, does not exceed much above £2 1/2 per mile, and this total expense of management and repair per mile is under that expended on maintaining and repairing the highways of many of the neighbouring parishes. I will now proceed to offer a few suggestions on the second point, the means for providing for the expenses of maintaining in the future the turnpike roads. It has been the custom hitherto when the tolls taken at the turnpike gates have been insufficient for defraying the expenses connected with the management and maintenance of turnpike roads, to levy on each parish through which the turnpike road passes the extra sum needful for the repair of as much of the turnpike road as lay within the limits of such parishes respectively. Now, while the general public paid tolls at the turnpike gates, this plan was fair enough. But now that the general public are to use such roads free of all tolls, it would lay an unfair burden on the parishes through which the turnpike road passed, to make them, and them only, responsible for repairing those roads which are the great arteries of horse and carriage communication through the country. The burden would fall extremely heavily on some parishes, while others would be called upon to pay nothing. As an illustration of this, I will refer to the case of Butler's Marston, which lying between two turnpike roads, actually touches on neither of them, and so would, if the maintenance of turnpike roads were thrown on those parishes only through which such roads pass, pay nothing towards the maintenance of turnpike roads, while at the same time, whenever the parishioners of Butler's Marston go to any of the neighbouring towns, they travel a considerable distance along the turnpike roads. By defraying the expenses connected with the turnpike roads out of the common charges of the Highway Board, or when there is no Highway Board, by means of rates levied on all the parishes comprised in the divisional district through which such roads passed, such inequalities in bearing the burdens of maintaining the turnpike

roads would be prevented. But the question arises, whether it is fair that inasmuch as turnpike roads have hitherto been maintained by tolls levied on the public generally, now that the turnpike trusts are to be dissolved, the whole burdens of keeping those in repair, should be thrown upon the ratepayers. I think not. And in connection with this part of the subject, I would draw your attention to the principle with regard to assisting, under certain circumstances, local taxation by grants from imperial taxation, which has been recognised by the Legislature. It is enacted by the Public Elementary Schools Act, that when School Boards are formed, and rate-supported schools are established, while the rates of the parish or district are to be the primary fund, out of which the expenses of maintaining such schools are to be taken—that when such parish or district shall have been rated for the support of schools, to a certain amount, 3d. in the pound, imperial taxation will be called upon to help the finding further funds when they are required. But to prevent waste and extravagance on the part of such boards, the assistance granted out of the National Exchequer is limited to a certain definite amount, and if further supplies are requisite beyond the 3d. rate and the Government aid for defraying the school expenses, it must be found by the ratepayers. Now, if the Legislature in the case of schools which are a new charge upon the rates have adopted the principle of giving aid in support of them after a certain definite rateable sum has been obtained from the districts in which the schools respectively are situated, may we not with fairness ask that the same principle may be applied with reference to the fresh burden upon the rates, namely, that of maintaining turnpike roads after the expiration of the Turnpike Trust Acts. For if the Legislature is ready to assist in providing a road to learning for the people of the land, shall we not ask the Legislature to help in bearing the additional burden now about to be thrown on the ratepayers of maintaining and keeping in good order those material arteries of communication, turnpike roads? It seems to me that the principle embodied in the Elementary School Act for aiding local rates by grants from the National Exchequer, is the right principle on which such aid should be given, and that in our endeavours to secure a fairer adjustment of the burdens which fall upon the ratepayers this principle should not be lost sight of, as it relieves the rates without weakening local responsibility on the one hand, and without encouraging extravagance on the other. But this is wandering somewhat away from the subject before us. I will therefore conclude by proposing the resolution I have drawn up, and which I believe has been sent by the secretary to the members of our Chamber: "That the management of turnpike roads, after their Trust Acts have expired, be confided to the District Highway Boards, and that the expenses of keeping them in repair be paid out of the common charges of such Highway Boards, assisted, when such expenses are excessive, by grants out of the National Exchequer."

The CHAIRMAN asked on what principle they would consider the expenses excessive?

Mr. MILLER: Act on the same principle as is adopted in the Elementary School Act.

The CHAIRMAN: This question is raised, when would the excess commence?

Mr. MILLER: After you had spent on the road a certain amount.

The CHAIRMAN: The argument you use would not affect the general public. They would not pay one farthing.

Mr. MILLER: Unless it was done on some definite basis like that of the county rates, and be a primary charge, they would not get any assistance from the Government.

Mr. LITCHFIELD: If you go to Government for relief whenever the charge is in excess, it will be in excess directly.

Mr. BRAZIER: Two or three miles of turnpike will fall upon a little parish like Grimsbury, and Banbury won't pay a single fraction.

Mr. TAWNEY: Does it not come upon the Board of Health?

Mr. BRAZIER: No. They only pay for the borough. Neithrop will have over five miles of road thrown upon it, and the matter is a very serious one. The charge would be upon parishes.

Mr. DAVIS: The charges fall upon the highway districts, not on the parishes.

Mr. LITCHFIELD: The law is so I believe. Where there are waywardens the expense is thrown over the whole district.

In districts where there are no waywardens, it will fall upon the parishes through which the road goes. For instance, at Brackley, till you go into the parish of Turweston all the expenses are charged to the district, but the moment you get into Buckinghamshire the expenses fall upon the parish through which the road goes.

Mr. JAMES GRIMBLY said that his present position as chairman of the Board of Health, which probably some of the gentlemen present were not aware included the parishes of Neithrop and Grimsbury, might be an excuse for his saying a few words in reference to this question. As far as Banbury proper was concerned it had hitherto maintained its own roads, and continued to do so. The roads in Grimsbury and Neithrop had been maintained by tolls taken at the turnpike gates, some of which had been abolished, and others at no distant date would in all probability share the same fate, so that it necessarily threw a very heavy burden upon those two parishes. There being no waywardens for those two places, they would be considered parishes on which the total expense of the maintenance of those roads would fall. The turnpike roads in the immediate neighbourhood of a town like Banbury were much more used than roads a few miles further away, but they had heard of such a thing as a road being kept in repair for £2 a mile—(No, no). He thought Mr. Miller said so.

Mr. MILLER: That is the management.

Mr. GRIMBLY: Those roads I refer to cannot be maintained under something like £50 a mile.

Mr. BRAZIER: It will cost nearly £80 a mile.

Mr. LITCHFIELD: No, no.

Mr. GRIMBLY: The parishes of Neithrop and Grimsbury will have nine miles of road to keep in repair, and the charge will be something like £400 or £500 a year.

Mr. LITCHFIELD: No, no.

Mr. GRIMBLY: I believe that statement can be substantiated. It appears to me that the charge should be borne upon a wider area than at present. The area should be extended. It should either be county rating or union rating. Without having deeply studied the question, it occurs to me that union rating would answer this district very well.

Mr. WESTOVER said that in considering the resolution proposed they must ask a definition of excessive expenses. If the average of three years' expenditure, they might find it very wide of the mark of what was necessary for the repair of the road, for the money often had not been economically expended. It was very severe punishment to be compelled to keep the roads in repair for the benefit of the public in general. The roads ought to be treated entirely separate from the present rateable area. They ought to seek the money for their maintenance in some other way. Mr. Knatchbull-Hugessen held out some hope that they might get some relief when they came to do away with the turnpike gates. Agriculturists as a body were anxious that the gates should be done away with, but they thought it was unfair to expect them to contribute so much for roads which were for the general benefit of the public. It was a national affair, and they ought to seek help from another quarter than the rates. It had been mentioned in the room that there should be a horse-tax—(No, no)—that a horse-tax on the graduated scale should be collected for the maintenance of the roads. It seemed right that those who used horses should pay for the roads. But there was no doubt they would never be fairly dealt with until they altered the area of local taxation altogether.

Mr. TAWNEY believed that those who used the roads should pay for them. He was extremely sorry to see the turnpike gates taken away, but he must say that the system had been very bad. The roads had been cut up into small districts, and each had a large staff attached. He believed that it was a mistake to have the lengths so short, but it only arose from the circumstances of the time. He was not sorry that the system was being done away with, but he was that the gates were, because he believed it was the simplest and best way of making men pay ready money for wearing out the roads. He thought it was too late in the day to ask State aid. Forty years ago there were no railways, and they could not say now that the roads were the main arteries of the country. They must be maintained by local taxation, and it should be spread over as large an area as possible. He did not believe they would ever get the Government to think differently. With regard to Neithrop and Grimsbury, they ought to come upon the Local Board. They were isolated—

Mr. GRIMBLEY: The charges on each portion of the Local Board are borne separately.

Mr. TAWNEY: So that the rich part of Banbury does not pay so much as Neithrop.

Mr. GRIMBLEY: Each pays for its own roads.

Mr. TAWNEY: It seems to me that the charge should come upon the Local Board.

Mr. GRIMBLEY: The three places are kept distinct.

Mr. TAWNEY: The traffic is very heavy near the town; it is the town's people who wear out the roads, and now that they have no turnpike to pay they will reconsp themselves in that way. According to the terms of Mr. Miller's motion the expense would come upon the general fund where there were highway boards, and if they could get the country cut up into large districts he believed there would be no great harm done by the arrangement. It was unfortunate for places where there were no highway boards, and the sooner they were adopted generally the better. They had talked about the cost of maintaining those roads, and one gentleman had said it would be £50 a mile. But they must remember they were speaking of a system that was passed, and he believed that in future things would be more economically managed than they had been. If they got a highway board, the first thing to do was to get a good surveyor.

Mr. LITCHFIELD: How will you get him?

Mr. TAWNEY: If you like in a manner of election; but perhaps you might shut your eyes to the fact that £20 in a surveyor's salary might make a difference of £500 a year to the district. It would be well if people could only abstain from voting for a man because he was somebody's aunt's first cousin, and would do it for £5 less than another man. What they wanted was supervision, and by it they would get the work done economically. This had been tested at Henley-in-Arden, where the cost of the roads was not half per mile what theirs came to. The surveyor resided out of the district, but he had four first-rate foremen who worked under him. He then proceeded to say that it was a great advantage if highway boards could meet in the morning. They could not do it here because their clerk was clerk to the Guardians. When they met in the afternoon it was generally spent in talking.

Mr. RISLEY was sure the Chamber felt very much indebted to Mr. Miller for his paper, and that they would all profit by the suggestions he had thrown out for their consideration. He did not regret the abolition of turnpike gates, but only regretted that it was not more general. He looked upon those gates as an intolerable nuisance by night and by day. It was a nuisance to unbutton one's coat on a cold night and search for a coin that possibly one might not have—and they could not help feeling sympathy for the old lady who, regardless of weather, had to come down in the very slightest of attire. He thought the Highway Act should be made compulsory—and then the difficulties under which they at present laboured would be to some extent removed. He could not help thinking that the Government was possibly waiting until all those trusts were done away with, in order to make highway boards compulsory, and give such assistance as should remove the difficulties under which they were labouring. He moved a vote of thanks to Miller for his paper.

Mr. SAMUELSON, M.P., was glad to have been present during the discussion, for there was no question the subject of the maintenance of roads, and the subject of the administration of roads generally, must shortly come before Parliament, now that there were so many trusts expiring. He thought it was very fortunate they should at this moment have Mr. Knatchbull-Hugessen at the Home Office. Although only Under-Secretary, he believed that no man was more intimately acquainted with legislation on this matter. It was a question which he might say had almost been the study of Mr. Knatchbull-Hugessen's life, and the advantage of having his assistance in settling the matter must profit them very considerably. He was very glad indeed to hear an expression in favour of Highway Boards being made universal. He thought they had too much permissive legislation. Probably at the outset it might be necessary to feel their way, and proceed tentatively; but when measures had been tried for a considerable time in a sufficient number of districts, they were enabled to discover their merits and defects, and if found to admit of any necessary modifications they should be introduced and the measures made general. There should not be one law for Northamptonshire and another for Lincolnshire and

Yorkshire. ["Hear, hear," from Mr. Brazier.] He was surprised at Mr. Brazier, because he believed in making the liquor traffic another permissive question. [Mr. BRAZIER: I believe it would benefit you as well as me.] The question then arose whether the area of distribution was sufficiently extensive, and they would probably find the more they enlarged the area the better it would be. In regard to the latter part of Mr. Miller's resolution, it might be worth while for them as agriculturists of the district, to see whether they could squeeze something out of the Government, but he thought it would be found very difficult to manipulate. Although Mr. Miller had drawn a very ingenious comparison between the highway and the school boards—in each case they were new charges—yet there was this difference, the school boards, besides being a new charge, was altogether indefinite, and it was necessary to coax the authorities in districts into the formation of school boards. It was a matter of expediency, and it was quite right they should have a guarantee given in any extensive parish. He did not think they would get any assistance from Government for turnpikes, and it would be for them to consider the best area of rating for their maintenance. Now, another reason why it would almost be impossible to ask the State to contribute was, that already over a large area there were no turnpike roads. If they would only go into the North Riding of Yorkshire—which equalled in area one or two of the Midland counties—they would find that in a large portion of it there were no turnpikes. The Government would thus have a ready answer, and point to the district saying, "You can't ask Parliament to vote funds for the maintenance of your roads. Those who use them—distribute area as widely as you like—are the proper persons to pay." He thought that that was how it would fare with the latter half of the resolution. He agreed with the first half, and said they should have an authority for the management of the roads, and it was most desirable that the Highway Act should be generally adopted. He should be happy to be of any use in Parliament in the matter and would receive any suggestions upon it. He would give his best attention to the subject when it was brought forward, and no doubt it would be very shortly.

Mr. BRAZIER: You should not compare Yorkshire with Northamptonshire and Oxfordshire. The manufacturers of the former turn their money over twelve times while a farmer only does it once.

Mr. SAMUELSON: It was the same before any manufactories existed.

Mr. LITCHFIELD: With regard to going to Government for money, I confess I cannot help feeling strongly that it had better be withdrawn from the resolution. I am not fond of trying to put public money into my pocket, and I feel thoroughly, after what Mr. Samuelson has said, there will be no chance of getting it. There was a certain amount of discredit in asking it. No Government would give them it, and they would be referred to what was done in Yorkshire.

Mr. DUN had great pleasure in seconding Mr. Risley's motion that a vote of thanks be given to Mr. Miller for his paper. He agreed with several of the speakers that the latter part of the resolution was not the strongest part of it, being rather indefinite. It was not likely that any application of theirs for assistance in support of those roads, which were really for the benefit of the locality in which they had been made, would receive any response from any Government. There was one proposition which fell from Mr. Westover which might be made available for the purpose, and it was something like the principle upon which those roads had been maintained during the long period they had been used, and by which those who used the roads might be called upon to pay for their support—namely, that something in the shape of a tax upon horses should be adopted. At present they had this kind of machinery adjusted under the assessed taxes, and something like £400,000 was collected every year in this country from a tax of 10s. 6d. per horse. That gave something like eight hundred thousand horses in this country not in the possession of agriculturists or employed specially in agricultural labour. He thought their owners might properly be asked to pay towards the expenses of those roads which every day they made use of. If a charge of 20s. was made for each horse it would realise something like £800,000, or nearly a million, and in this way they would get at a large number of horses in

the possession of brewers, millers, and others who, by the ordinary system of assessment, would not pay very largely towards the support of the roads. This suggestion might perhaps meet some of those difficulties which seemed at present to be in the way of an equitable adjustment of the question.

Mr. MILLER said that one great reason why he appended the second part to his resolution was that that the Chamber, about a year and a half ago, passed a resolution in which much the same thing was embodied. It was then expressed that not only should local rates be called upon, but imperial taxation as well. He thought the horse tax would be rather a hazardous thing for agriculturists; they should not say too much about taxing horses, for perhaps horses used in agriculture would be taxed as well. He mentioned that he should like to see the old plan returned to—namely, not sending in the resolution until the paper had been read. Under the present arrangement, one had to draw up the resolution and give it to the secretary, and then write the paper; at least it had been so with him, in consequence of want of time. He was quite willing to withdraw the second part of his resolution.

Mr. WESTOVER: The resolution is sent to the secretary, so that he may put it on the notice calling the meeting, and then the members know what is coming on.

Mr. WALTON objected to taxing horses for the maintenance of the turnpike roads.

Mr. COLEMAN said that he was a member of the Brackley Highway Board, and had been for some years, and it was not for the want of talking or changing surveyors, but it did not succeed. The working of the waywarden board was a failure altogether, and here they were about to pass a resolution that the roads should be confided to them. They spent more money on the roads and they were not better, but worse. The great blot was the want of supervision. It was impossible for one

man to superintend 175 miles of road. They were told that the waywardens were not to interfere with the management of the roads, and were only to complain at the meetings; but unless the waywardens did all they could to assist the surveyor, the money was shamefully wasted. They would do wrong if they recommended the Act to be made compulsory, and there was a general feeling among farmers that it should not be so.

Mr. DAVIS said the Act made it compulsory to appoint only one surveyor, but he thought there should be a discretionary power left to a Board to appoint such a number of surveyors as they thought necessary.

Mr. WESTOVER said it was hardly fair to condemn the highway board system because it did not work well in some places. Their district (the North Wootton) was said to be a model district, because they did not quarrel. The Board had always worked amicably. He admitted that there was a want of supervision.

Mr. LITCHFIELD moved, and Mr. TAWNEY seconded, that that part of the resolution asking State aid should be struck out, but on the vote being taken, fourteen voted for the following resolution against ten: "1. That the management of turnpike roads, after their trust Acts have expired, be confided to District Highway Boards, made compulsory, and of a wider area than at present. 2. And that the expense of keeping the roads in repair be paid out of the common charges of such highway boards, assisted by grants out of the National Exchequer."

Mr. LITCHFIELD was rather disappointed to find they had confined their attention entirely to turnpike gates, and should have been glad if they had turned their attention to highway gates.

Mr. SAMUELSON moved a vote of thanks to Mr. Holbech for presiding, and the proceedings terminated.

THE DORCHESTER FARMERS' CLUB. THE AGRICULTURAL LABOURERS' HIRING FAIRS.

At the December monthly meeting, the President, Mr. J. G. Homer, in the chair, the attendance was large considering the time of year, this being the last Saturday of 1871.

The Rev. THEOPHILUS BENNETT read the following paper: Jeremy Bentham says that "The poor would need less charity if they got more justice." And I believe the priest who preached the funeral sermon over that illustrious Irishman O'Connell, chose for his text, "Blessed are they who hunger and thirst after justice" (*δικαιοσύνη*), which is a better translation for the Greek original than that of our version, which has righteousness. I know it is the desire of all here to render justice, and therefore I think myself happy in addressing you. I once travelled with a clergyman and his wife, and the clergyman told me that his wife was constantly preaching two sermons, very short but very pithy. Her morning sermon was, "Lessen your wants," and her afternoon was, "Help the poor to help themselves." This should be our motto, to help the agricultural labourer to help himself—to inculcate upon him the great lesson of self-help. Heathen writers urge, "Help yourselves, and the gods will help you." Teach the agricultural labourer how he may work; how he may supply himself with the necessities of life; how he may preserve his health—in short, help him to help himself, and you do a great work. Gentlemen, our subject to-night is "The condition of the agricultural labourer." Observe the subject is general. It does not refer exclusively to that which has almost passed in other parts of England into a bye-word and a proverb, and a standing reproach—the Dorsetshire labourer. But as this is a species under the genus, and one that touches us closely we may be permitted to draw attention to our own county labourer, and see his condition, and how we may improve it. For "the street will soon be clean if every one sweeps before his own door." If we want to purify the ocean, we must purify each drop. Whilst our charity or Christian love should not end at home, it at all events ought to begin there. In speaking of this topic—bear in mind I am alluding to the agricultural labourer pure and simple; I am

not alluding to the shepherd, who has more pay and perquisites because he is entrusted with the care of property, the meat of which at 10d. per lb., to say nothing of the gold-procuring-fleece, is most valuable. Nor am I alluding to the carter, who is a village Piekford, often entrusted with the conveyance of very precious articles, with no other insurance but his native honesty. The man is always commended who calls a spade and not "an implement of husbandry," but simply "a spade." And when I speak of an agricultural labourer, I do not allude to a foreman, a shepherd, or a carter; but exclusively to the lowest grade—the agricultural labourer. I wish this to be distinctly understood, so as to narrow our deliberations to the worst paid and most necessitous class of the community—viz., the Dorsetshire agricultural labourer pure and simple, a labourer and nothing more. Regarding the condition of the labourer (condition, Latin *conditio*; that from *condo*, to build, to make) I. We take condition as meaning state, a particular mode of being, applied to external circumstances, to the body, to the mind, and to things; in the sense in which Pope uses it—

"Condition, circumstance, is not the thing;
Bliss is the same in subject or in king."

What is the actual state of the agricultural labourer? I take up a little pamphlet, entitled, "Letters on the Large Farm System," by George C. Miall (reprinted, by permission, from an American daily paper, *Newark Daily Advertiser*), and I read extracts from this book, not as endorsing them, but in order that they may be refuted, if untrue or exaggerated, by the experienced friends I see around me. In the first page, Mr. Miall says: "In the county of Dorset, where the farms are very large, and the labourer's pay is very low, women receive 6d. a day in ordinary time, and 1s. 6d. when there is extra work, &c." On pages 14 and 15, I read the following: "The amount of wages paid, and the religious, moral, and social condition of the English agricultural labourer is absolutely disgraceful to a country which boasts of her civilisation. Our 'Saturday Reviewers' and 'kid-gloved' writers generally

ignore this state of things altogether. Here are the facts: The Dorset labourer's weekly pay is 8s. per week. In addition to this he has 'house, firing, and cider,' and in some cases other small perquisites, which of course depend entirely on the disposition of his master or employer. In some cases they get ground for planting potatoes, and 'allowed' to keep a pig; but in most cases the large farmers prohibit their labourers from keeping stock of their own. The 'house' is in many cases a mere mud hovel, not worthy of the name, if they are lucky enough to get one at all. The 'firing' is the furze or gorse which grows in large tracts on the hills, and affords better shelter to the game of the squire than it does warmth to the hearth of the poor labourer. The 'cider' is cold, thin, watery, sour stuff, which does him far more harm than good, and it is often 'doctored' in harvest time in order to excite the poor wretches, so that an extra amount of work may be got out of them. Parliamentary commissions have told us of the immorality caused by the overcrowded state of the labourers' cottages. No one can reside for many weeks in an English village without becoming aware of this state of things. And no wonder, when we consider that the ordinary dwelling of the labourer consists of but two rooms—one for eating, cooking, and for all other purposes, and the other for sleeping. I know myself dozens of cases where the father, mother, and six or eight children, grown up or otherwise, occupy the same sleeping apartment, and even bed during the winter, all huddled together like a litter of pigs for the sake of warmth. The only wonder is that the poor creatures are not worse in morals than they prove to be at the present time. What a satire this state of things is upon the recently passed Elementary Education Bill and the endless wranglings and bickerings over it! The higher classes fighting about who shall control the religious opinions of the children of the peasant, and at the same time they will not allow the parents proper means to live commonly decent. With the present low prices of wages compulsory education in the rural districts is an impossibility. The large farmers won't employ single men, or married couples without children. They like a man with a large and rising family. They insist on the boys going to work at about ten years of age, and the girls at about fourteen. Besides, how could a man maintain his family without the aid of his wife and children? When the labourer returns with his family from their daily toil the evening meal, which generally consists of an immense pot of vegetables, flavoured, perhaps, with a small scrap of pork or bacon, where are his home comforts? He is only too glad to exchange the rude cheerless cottage for the roaring fire of the neighbouring beerhouse, where he can spend the evening over 'a pint of beer and a pipe of baccy,' and a dance, may be, on Saturday nights." 2. Condition means quality, rank, social grade. What sort of quality can a man maintain on eight shillings per week? Put yourself in his place. How could you get on with only the bewildering income of eight shillings? Mechi says: "The economy of the labouring classes must be truly wonderful." One-half the world don't know how the other half live. And this eight shillings a week problem is one that I fondly trust none of us may ever be called on practically to solve. Talk of luxury, talk of even common beer! To paraphrase *Punch* slightly:

Eight shillings a week, with wife and kids to feed,
Don't leave a fellow much for beer indeed.

And yet so far as dignity is concerned, is it not in reality great? "Instituted, like marriage, in the time of man's innocence," it is the most ancient, for it was our original condition.

When Adam delved, and Eve span,
Who was then the gentleman?

And yet there are those who, from their pride of place, look down upon the labourer as if he were a mere serf or hind. Even their employers do not show that interest in their welfare that one might reasonably expect. There is too much of intolerable pride stalking haughtily over the land—too much of the unlovely spirit of caste, too great disservice of class from class. What says the practical experience of Mr. Scott Russell on this subject? After viewing this country in comparison with others, he says, "I have come to the conviction that the social relations between the different classes of society in England are too intolerable to last long; they must either be speedily and timely cured, or they will suddenly cure themselves." 3. Condition means state of the mind, temper, tem-

perament, and complexion. The complexion of many of the labourers is florid, clear, and bright, and rosy as their master's apples. Like David, they are "ruddy, and of a fair countenance." The temperament of our Dorsetshire labourer is truly polite. I have noticed genuine refinement of feeling in several of them; they are "Nature's gentlemen and Nature's gentlewomen." "Temper," said a bishop, "is nine-tenths of Christianity," and, considering their trying lot, their tempers are admirable. Seldom do you hear angry expressions. All this is the more remarkable as they take few pleasures. There are not many things tend more to sweeten the temper than amusement, but these our labourers have not. Even the children do not play with the same vigour as those in other counties. Happily, we do not hear of degrading sports and amusements amongst our people like the bulldog fighting in Staffordshire and the Sunday dog racing of Lancashire. But cheap excursions, cricket, football, and such like, are things almost unknown to our rural population. Something might be done to encourage harmless pastimes and diversions, remembering the trite observation, "All work and no play make Jack a dull boy," ay, and a dull worker too. And then with regard to the women, it has been remarked that shopping is to ladies what shooting is to gentlemen, but our poor Dorset women have very little money for that. Lord Sydney Godolphin Osborne lately spoke against this vice of over-dressing, coining the word "dressard" to fully express his meaning. But with their meagre pay, few of our labourers' wives or daughters, if ever so much inclined, can afford to be dressards. And in this matter it would be well if those above them set a better example, and dressed with more shamefacedness and sobriety, and gave the money thus saved in charity, remembering what the genial Goldsmith says—"The nakedness of the poor might be clad from the trimmings of the vain." And this brings me to the fourth meaning. Condition includes "moral quality, virtue or vice." How are our people as to morals? Professor Buckman answers, "The morals of the people are weak and unstable, like the Dorsetshire fences! Many of the young people marry themselves before the clergyman marries them." Where glove-making is carried on, the females are more generous of their charms than even in other parts of the county. Glove rhymes to love, and illicit intercourse is drawn on. "Love" children are plentiful in the county, and the first child I was ever called upon to christen after I entered on my duties at Wynford Eagle was called by this name. The mother, not being then a married woman, instead of being ashamed of giving birth to an illegitimate child, actually insisted on branding it with this name; and Love it was called at the font, and Love it will remain to its dying day. A love child, it is called Love. I spoke about there not being many dressards amongst our agricultural women, nor are there many of habitual drunkards amongst our men. There are several hamlets and villages in our county where there are no drink-shops or public-houses. Around Maiden Newton I know of seven parishes where there is no house for the sale of intoxicating drinks, and as a result drunkenness is almost unknown. I hold two such parishes unsullied by the liquor traffic, and I am happy to say I do not know a working man in either of them who is a drunkard. We pray, "Deliver us from temptation," and where there is no dram-shop one great temptation is removed. The tired labourer is not then assailed at his weakest moment, when he returns fagged from his work, by the bland president of beer-barrels and spirit-flasks. There is, I am afraid, a good deal of filly talking, and some of the women are very foul-mouthed in their language. I have heard of a nobleman who was kept awake during several hours of the night by the lewd and indecent talking going on under his window as he lay on a bed in the village, about eight miles from this county town. The fountain of the human heart must be very impure, from whence flows the libidinous talk of field labourers of both sexes. There is not much more attention paid to the ninth than to the seventh commandment, and one neighbour thinks very little of robbing another of the treasure of a good name, more precious than silver or gold. As our greatest of poets says,

"Good name in man or woman, dear my lord,
Is the immediate jewel of their souls."

I have myself taken people to task for thus filching away the reputation of their neighbours by bearing false witness against

them; but only to meet the sternest opposition. In one case where I did this on the clearest evidence, the offending guilty party have become so exasperated at not being permitted to persevere in this nefarious course of slander that to avenge themselves they excommunicate themselves so far as their parish church is concerned, for they never enter it. Then, again, the third commandment is frequently violated, and the hot oath proceeds from blasphemous lips. In France, in former days, the lips of the blasphemers were branded with a red hot iron brand. If every one got their deserts in this way, there would be many hot mouths in the county; and, perhaps, some amongst the employers as well as the employed. But I must not dwell longer upon this dark theme of immorality. 5th. I therefore proceed to a fifth meaning of the word under consideration. Condition means terms of a contract, or covenant—stipulation. As Dryden says:

“Make our conditions with your captive king.”

As the sacred writer, St. Luke, says:

“He sendeth and desireth conditions of peace.”

What are the conditions as to the hiring, &c., of the agricultural labourer? On the 14th February (Ash Wednesday in 1872) the Caudlemas fair is held for hiring labourers. Who is there that approves of this system? Do the masters? Do the men? Is it not rightly called mop fair, from its mopish, gloomy nature? Does it not make dismal those that attend it? We have heard of slave markets—is there nothing of the nature here? Slaves are trotted out; put through their paces like horses under the auctioneer's hammer. Listen to the picture given by my neighbour, Mr. E. Whittle, when speaking of the payment of agricultural labourers in Dorset before this respected Club, on December 30th, 1865. He said, “Now he came to the system of hiring at Caudlemas fair. On the 14th February, on coming into Dorchester, they found a lot of men in the streets, waiting to be hired, some of them standing up against Messrs. Williams' Bank. He knew a gentleman who hired a very able carter, as he thought, who was standing there; but when he got home he found the man was a cripple. After that he believed his friend always turned his men out before he had them home.” Now, I ask, is not this turning out another name for putting him through his paces, to see if he is sound in wind and limb, something very like Mrs. Beecher Stowe tells us about the American slave market of former days? I ask again is an open fair a good place in which to make an agreement! Does not this annual hiring generate a most unsettled restless feeling between employers and employed? Is not the bargain very like “a pig in a poke” on both sides? The master can know nothing of the man. Again, to quote Mr. Whittle, of Toller Fratrum, “They could not tell the worth of a man hired at a fair, any more than the man in the moon. He might turn out good or bad. If a farmer had a bad man he wished to get rid of him, and might give him a character which was deceptive. Not that he stated what was untrue; but because it did not contain the whole truth. But that was the fault of the system. The present plan necessitated a change once a year. On the 14th of February a labourer came and asked, ‘How about another year, master?’ which no other servant did.” Mr. Genge said on the 20th of February, 1864, “His experience of fairs was that he once hired a carter, who came and took his horses, and went off with them, and he had never seen him since. That was one specimen of men hired at fairs.” And to show that it is “a pig in a poke” bargain on the side of the agricultural labourer, I quote Mr. G. W. Homer, of Athelhampton, speaking before our Club on March 15th, 1862: “A servant also, who makes an agreement”—at a mope or drone fair, as Mr. Homer calls them from the drones that frequent them—“at such a place, has to reside with his family in a house which he may never have seen, and which may prove to be an uncomfortable and most unsuitable one.” All this teaches us that master and man could spend their time on St. Valentine's Day more profitably than by attending this dismal drone fair, which most agree ought to be abolished; or, if it be retained at all, ought to be transferred from St. Valentine's Day to Michaelmas Day, when the goose is rumpant! As to payment. In ancient history we read of work so highly esteemed that the labourers were paid daily in gold. And agriculture is of such vital importance to the community that its labourers should be adequately and punctually

remunerated. When I had labourers myself in Ireland I always paid them on Friday nights, and some of them for task-work making—making drains—drew as much as 19s. per week during the short days of the winter months. I think, with many others, that all perquisites should be abolished, and that the Dorset labourer should be paid in money every Friday night. “Capital and labour,” said Mr. J. Howard, “are the two piers of the aids on which society rests. Each should do their duty. The capitalists should pay adequately and punctually. And the labourer should ‘buckle to’—be “all there”—and put his heart into his work, giving “a fair day's work for a fair day's wage.” For there are many complaints that the labourer does not do so much work now as in former days. This reproach it should be theirs to remedy. Then with regard to the farmer. The adage says, that “when the fisherman is not engaged in his calling he should be mending his nets;” and therefore the farmer M.P., Mr. Clare Sewell Read, says in his admirable lecture on our subject to-night, “There is one thing I wish to impress on my brother farmers, and that is the necessity of making a better use of wet days. I do think we should all try and get a great deal more in-door work done in wet weather. Preparing manure, crushing corn, grinding cake, and many other things ought to be done on rainy days.” Further on in his lecture, the tenant-farmer M.P. says, what might be inscribed in golden letters over every farmer's mantelpiece—“The farmer has many opportunities of doing good at no great cost to himself. In many cases, I fear all the skim milk is given to the pigs. Why should it not be given to the labourer who requires it? Then again there are the comforts of the farm-kitchen that might be dispensed.” I now come to what I consider ought to be inscribed in letters of gold in a conspicuous place before every farmer's eyes: I think every farmer ought to be able to feel every night that he has done something towards making those around him happier and better, and if he cannot do that, why then I think he has not played his part satisfactorily. Piece or task-work is highly commended, for work is thus done more expeditiously, at less cost, and it affords more encouragement to the skilled labourer. The better the work the better the pay. When farm-servants themselves were called together the other day, and were asked freely to state what they desired, the sum of their demands was liberty for cow and pay at the rate of 15s. per week. And here let me remark that hiring should be by the year, otherwise the labourers may greatly inconvenience the farmer by leaving at the busiest season, during harvest-time for instance. Emigration is strongly recommended, and it was lately authoritatively stated that there was room for 4,000 men like Wiltshire labourers in Canada. So far for the word condition. I have only room to glance at my other two words—“agricultural labourer.” Agricultural, from *ager*, a field; and *cultor*, a cultivator—the most primitive, the most extensive, and the healthiest employment. *Semper vivet!* Labourer. If we take the Latin derivation we infer he should be propped up; labour, from *lubo*, to faint, to fail. Labourers put, or ought to put, their bones and sinews into their work. For the fourth commandment is directed as much to working hard all the week as to resting on Sunday. “Six days shalt thou labour and do all thy work.” Labourer: some derive it from the Greek, and if we take their derivation we should supply them with plenty of good wholesome food. *Lu Bullde*, very much; *βοσος cibus*, food. Therefore a labourer is one who takes and requires a good quantity of food. He does much work; he wants much food. We hear of feeding a horse in proportion to his work. The same principle ought to obtain with the labourer. He has to work hard, and must therefore “keep up his pecker.” *Ev nihil nihil fit*, “From nothing nothing comes.” “An empty sack cannot stand upright.” The man with pendulous gills, like a turkey cock in the Christmas carol, said, “If I go I must be fed.” And if we want our labourers to go ahead with their work, and to have lots of go in them, they too must be fed. We have spoken of the condition of the labourer. We have taken the word painting of some of those who use the darkest colours. We now come to inquire how this condition may be improved. I proceed, therefore, to offer some suggestions, in the hope that they may be largely improved upon and increased by the members of our club. What are the helps and aids that may be afforded to the labourer and his family? 1. “Clubs.” Motto, “Help the poor to help themselves.” Clothing clubs, with good handsome premium added. In our club at Toller Fratrum

and Wynford Eagle we add 7s. to the sum subscribed; and, in order to induce each depositor to strive to work up to a pound, I have this year added 9s. to the 20s. paid in by 20 depositors. Boot club. Here I practice a graduated scale on the principle of the railways. First class, 4s. added; second, 3s.; third, 2s. Blanket loans from November to June. Local charities. I was much delighted the other evening to be able to give each labourer a crown-piece from a parochial charity. I was going to speak of provident clubs, such as Foresters, Oddfellows, our own county club, &c., but the infelicitous new Poor-law, outdoor relief, and such like, seem to choke off all these. Post-office savings banks. Labourers ought to take advantage of these. In my own small parishes, population of both 214, we have over 43 depositors. Mothers meetings. Where women may come to do needlework, and get garments at a reduced rate. The new movement of parochial councils, too, may be made to benefit the labourer by discussing those things connected with his temporal welfare. Our Divine Master, whilst making the soul His great mission, did not neglect the body. Then again the great principle of co-operation, which works so well in towns, should be largely extended to the country; end every village and even hamlet should have its distributive store, where good genuine articles might be purchased at a cheap rate for ready money. The sacred oracles say, "owe no man anything." But this is a command more honoured, I fear, in the breach than in the performance. Debt prevails to an alarming extent. To use the plaintive words I once saw posted up in a shop, in many places they have got tired of all this—"Poor Trust is dead; Bad Pay has killed him." The debts of the people keep co-operative stores from being established amongst them. But by co-operative stores 50 per cent. would be gained in quality, true weight, &c. Be it ours to encourage thrift in the management of expenses, and providence on the part of the labourer. Lord Nelson, at his audit dinner in Hampshire, suggested, with the general concurrence of all the tenant-farmers, that 1s. per week should be added to the wages of all labourers who belonged to a registered provident society. It is well to establish a system of prizes for the best and most productive cottagers' garden, for the cleanest cottage, best roots and vegetables, best bread, and best honey, &c., &c. Privileges. Under this head we may mention skim-milk, at a nominal cost of 1s. a farthing per quart, or, better still, what Lord Nelson recommends to his farmers, viz., to start a system of small cow-lands to be let to labourers of good character who have saved £10 or £20. The privilege of keeping a pig, to supply meat for the cottage table, and manure for the cottage garden. The privilege of keeping poultry, to supply the family with eggs. An egg is generally valued at about 1d.; taking it at this, where can you get a greater amount of nourishment for the money? A little pamphlet has been published this year by Thomas Bosworth, of 198, High Holborn, London, and if we would only realise in actual practice what is set down on the title page, it would be an immense boon. This is what appears on the title page: "To the farmers and cottagers of Great Britain. How the French make fowls pay a profit of 500 per cent. per annum, producing fat young fowls at 3d. per lb. Eggs, winter and summer, at 1d. per dozen, by Kindard B. Edwards." But time would fail me to do more than mention gristling (which is highly esteemed), bee keeping, gleanings, and such like. The farmer, too, might buy backs of pork, cheese, &c., by the hundred weight, and thus get them cheaper, and dispense at cost price to his labourers. In harvest time beer is to be recommended for labourers rather than cider. There is more stay in the former. Liquid largess of some kind has to be dispensed when extra work is required, the old saw says:

"A wet groat goes farther than a dry shilling."

Labourers' dwellings should be constructed with proper regard to health and decency. And it might be desirable that every twelve householders should elect some wise and discreet man from among themselves to be a sort of father to the rest, to look after broken glass, drains, roofs, and various little et ceteras. Owners of labourers' cottages might be required to take out a licence, costing a nominal sum, at the beginning of every year. Each house to be licensed to accommodate only so many as it was capable of doing with decency. A fine to be imposed for overcrowding as in the case of public conveyances. And here let me advocate the use of Moule's system of earth

closets. It is calculated that attention to this system is worth over £1 a head to each person that fully adopts it, to say nothing of its extreme value in a sanitary point of view. Let those who doubt go for a lesson to the common domestic cat. Recent events at Sandringham point to the vital importance of Moule's system of dry earth closets. Attention to all charities that have for their aim assuaging the misfortunes and hardships of poverty, such as hospitals, cottage hospitals, and dispensaries. Talking of health, let me give a practical hint to all of the male sex who have chins capable of growing a crop which should never be shorn. It may be trimmed like a neat hedge, but mown bare with that implement which is fast going into disuse, I mean the razor, it never should be. Example is better than precept. Here is an example—under my nose, and all over my cheeks and chin. Therefore I say to all, come and grow it; begin with the first day of January, 1872, and never shave again; no, never shave again. If my good friends the agriculturists—farmers and labourers—only try my plan of a good, warm, comfortable, costless beard for 12 months, after that time I warrant they will be proof against all inducements to open up daily or weekly scores of pores, through which the cold air permeates, producing toothache and various other ills to which beard growers are seldom heirs. Since Providence gives us males this fine leonine protection, why should we mar His work by depriving ourselves of it? Gratis advice for all men—"Grow your beards; grow your beards!" The conundrum says "A man is thinner than a lath." Why? When? Do you give it up? When he's a shaving! There are many other aids and helps that I can only glance at—thus, technical instruction; fishing-net making, called "breeding"; straw plating; taking in washing, use of Australian meat; mushroom gathering; wool gathering; manure gathering from the roads; glove making. Adam Smith says, "Labour is the source of all wealth." A greater than Adam Smith, "There is much food in the tillage of the poor." "In all labour there is profit."

Mr. GENGE considered that they had just heard one of the most important and able lectures of the session. He gave Mr. Bennett credit for the kind feeling which it was well known the reverend gentleman displayed towards the poor of his own parish, and for the endeavours which he personally, made to anchorate their condition. Mr. Bennett, while enlarging upon the question as to the condition of the agricultural labourer, had made some quotations from the work of an American writer, the picture presented by whom was certainly much overdrawn. Something of what was said by that writer might possibly have been true in a few isolated cases, but his statements were by no means a fair representation of the condition of the agricultural labourer in this county at the present time. He (Mr. Genge) particularly mentioned this county, because a great deal of unjust opprobrium had been cast upon it. He contended that the present condition of the agricultural labourers in Dorset was far better than that described in the pamphlet in question—he thought it would compare favourably with the state of any labourers of the same class, or indeed in any other calling in any part of this country. Mr. Genge reminded the meeting of the many advantages possessed by the agricultural labourer compared with the man of the same standing in other occupations of life; working in the open air he had the benefit of pure atmosphere; if his earnings were a little less he could supply himself with daily necessities at a cheaper rate; he had more wholesome food and beverages at a lower price. Regarding the point as to the amount of remuneration given to the agricultural labourers, were the employers to blame if the standard did not meet the wishes of every philanthropist? Because the labourer said he wanted 15s. per week was he to have it? No doubt the farmers would like their premises and land at a stated rent, but then could they get that? There really had been an immense amount of twaddle, many unnecessary remarks in discussing the condition of the agricultural labourer. In reference to the question of perquisites or payments in kind, it should be borne in mind that in many cases money payments could not be substituted without considerable injury to the labourer himself. Let them for instance take wheat into consideration; it had been the custom to supply it at a reduced rate, and the labourer got a good sample. In saying this he well knew there had been some abuses of the practice, corn of inferior quality being supplied; but then was a good system to be abolished simply

because there were some exceptional cases of abuse? As a rule the master gave a fair sample at a reasonable price. Thus the agricultural labourer had a good wholesome loaf of bread. Respecting the question of liquor the rev. gentleman appeared to recommend in the latter part of his lecture what he condemned in the first part. Mr. Genge asked who could supply to the labourer ale or cider at a cheaper rate than could the farmer himself, who bought or made it wholesale? Was it not better to get it from the farmer than in small quantities from the public-house keeper? He submitted that the practice of supplying to the labourer a good wholesome beverage, that which the farmer consumed himself, was in itself commendable. Coming to the matter of dress the vice-president remarked, there were not wanting instances of the agricultural labourers, their wives and daughters, apparently stepping above their station in life. It was quite true that one-half of the world did not know how the other half lived; but the labourers had money for dress, and they would have finery with it. He thought the value of a man's earnings depended a great deal upon the management of the home, the manner in which the money was spent. While in one house everything was clean and comfortable, with everything that could be desired, in the adjoining house, although the earnings were more, yet all was uncomfortable, the sole fault being in the habits of the occupants themselves. A good deal has been said in the way of recommending that the labourer should have land and be allowed to keep a cow. Now that was thoroughly impracticable. He knew that fault was found because of the extent of unencultivated land. Mr. Mechi spoke of the amount that could be brought into cultivation. But supposing that the labourer saved say £10, was it practicable that he should have a portion of land and a cow? Why, would not the cow bring him into debt? What could be done with the animal when it did not produce milk? It would then be no benefit to the labourer. As for poultry it should be remembered that the labourer should not be led into temptation. If he kept poultry a very great temptation would be presented to him, because on passing the corn ricks and so on, he would feel strongly inclined to fill his pockets—boots had at times been used for such purposes—so as to carry home a little for the birds. Of course this would not be the case in every instance; on the contrary labourers as a rule were honest and trustworthy—still to keep poultry would be to offer temptation, and the practice should therefore be discontinued. Mr. Bennett recommended that the labourers should be afforded the opportunity of buying necessary articles at wholesale prices; that to some extent was already the case. Still much more in that respect could doubtless be done. He firmly believed that a gentleman situated in a parish as was their reverend friend, had the means of doing a vast amount of good. He knew that at Puddletown what were called local charities had been freely distributed this Christmas, and he thought they had proved highly beneficial. If clergymen would interest themselves as Mr. Bennett had done in the formation of clothing clubs and such like institutions, the condition of the agricultural labourer would no doubt be very much improved. In conclusion, Mr. Genge said they had to thank the rev. gentleman for the considerable trouble which he had taken in the matter, and for the good intentions he had evinced.

Mr. R. DAMEN (the Mayor of Dorchester) did not exactly agree with all that Mr. Bennett had said; he rather adopted the views to which Mr. Genge had just given utterance. There was, however, one part of the lecture which had his entire approval—that with regard to the Dorchester hiring or “mop” fair. This town was not exceptional in that respect, for he remembered that at Newcastle there was also a great “mop” fair. Thousands of persons from all parts of the country congregated there, special trains running the previous day. Men and women, servant boys and girls, mixed indiscriminately together spending the night in the town and returning to their respective homes the day after the fair, which was the greatest curse that the county of Northumberland had. More characters were lost on fair night than in all the other parts of the year. He thought then that it was the duty of every right-feeling man placed in the position of their friend the lecturer, to discourage in every possible way such a system as that in question, which led to no good. Regarding labour, it had always been and was still a difficult question. The political economist averred that the remuneration in the labour market was ruled

by supply and demand—and no doubt in some measure labour would be paid for according to that principle; still he (Mr. Damen) gave the employer credit for being influenced by higher feelings than that. In many cases labourers were engaged for say 30 years for all the year round, through winter and summer alike, irrespective of wet days, and pecuniary loss was thus often sustained by the employer, who knew that, without such consideration the wives and families of his men could not exist. He (Mr. Damen) was sure that the best possible feeling prevailed on the part of the employers. He had had considerable experience of country life, and he was also pretty well acquainted with the employment of labour in the towns; and having this advantage he could confidently affirm that the agricultural labourers were infinitely better off than the town labourers. Let them for a moment contrast the former with some of the working men who lived say in the Fordington parish. Many of the town labourers when they had no work were starving. Those employed by the builders and so forth earned at the most 2s. per day during the summer, and they had no extras in the shape of cottages, gardens, or fuel; no cider in harvest, as had the agricultural labourers. The town labourer, in far too many instances, lived in some miserable cottage or lodging that was a disgrace to the owner and occupier alike. From conversations he had held with persons in this and various counties he was sure that the agricultural labourers were better paid, were better clothed, and had more comfortable homes than was the case years ago; this was especially the case with regard to Dorset. Everybody knew that. He thought nobody could look at the agricultural labourers without concluding that their condition was superior to that of the same class of men 30 or 40 years ago. Personally he wished that they were better housed; still a great improvement had already taken place in that respect. He was quite certain that progress was being made with regard to their general condition. Referring to the question of dress Mr. Damen spoke of the extent to which broad cloth has been substituted for the white smock-frock now so seldom seen on Sundays, while as regards the gentler sex there is the difficulty of distinguishing servants from ladies. Throughout the country the improvement as to dress here indicated had, he said, been witnessed. On every hand progress was made. At the same time he wished the progress was more rapid; however they must take things as they were. There was another point. As a rule were not men paid as well as their employers could afford to pay them? He knew from an agricultural point of view, for some years past the farmer had been positively paying for labour more than he could afford. Mr. Damen alluded incidentally to the difficult question of emigration, which is set down as a great remedy for the evil complained of—low wages—and, concluding his practical remarks, observed that although the population of the country is at present double what it was at the beginning of the century, yet all classes of the community are better clothed, better housed, and superior also in many other respects.

Mr. G. WOOD HOMER thought that meeting a body of farmers such as the Dorchester Farmers' Club the rev. gentleman had shown considerable pluck in coming forward with such statements as those which he had quoted from the pamphlet in question. He did not think that Mr. Bennett really believed that his quotations were accurate; the rev. gentleman had identified himself too much with the rural population to believe for one moment the statements advanced by Mr. Miall—doubtless he now brought them forward in order that they might be satisfactorily refuted. (Mr. Bennett: Hear, hear.) Let the truth be spoken about the matter, and let not such statements uncontradicted go forth to the public. Mr. Bennett had said: “Let justice be done.” Now the way in which that could be done for the landowners and occupiers, chiefly the former, was to see that the poor in their respective districts had work. To do justice to the poor man was, he argued, to find him employment at satisfactory wages. In this country there were hundreds and thousands of acres requiring improvement, which work would pay 5 per cent. Yet it was not done. He did not know why. Mr. Miall probably would explain that the law of promiscuity was the reason; he (Mr. G. Wood Homer) did not think it was. There was one improvement as to the expediency of carrying out which, there could, he thought, be no manner of doubt—he referred to cutting straight and deepening the river courses. That would be a satisfactory work in winter, one which would pay well. It seemed

as if the attention of landowners had not been sufficiently drawn to these matters. There was a glaring impediment in the way of improvements being executed. They were no sooner done than they were immediately assessed to heavy local burdens. Let a man improve his land and down comes the Assessment Committee, taxing him 3s. or 4s. in the pound. That stopped a great deal of improvement in land. The rev. lecturer has alluded to the rate of wages paid in this county, mentioning 8s. per week. Now he (Mr. Homer) did not think any man would for one moment believe that figure was the standard of wages in the county of Dorset. In one instance to his own personal knowledge 10s. per week was paid, and the greater part of the year the rate, in consequence of perquisites, far exceeded that sum. Speaking on the advantages of cottage accommodation, Mr. Homer mentioned that while he let a habitation for 2s. 6d. per week to a man who did not work for him, he let the adjoining one, which had a larger garden attached, for 1s. weekly, although it was worth 3s. 6d. Thus he allowed that man 2s. 6d., about which nobody had anything to say. Then again fuel and potato ground were found. Regarding the latter perhaps there might occasionally be a direful failure in the crop, prejudicial to the labourer; but then the farmer himself had at times to suffer from a failure in the wheat crop. He had been afforded the opportunity of talking on the subject of the remuneration of labourers to the farmers of Essex, Wiltshire, and other counties, and had found that if weekly wages in Dorset were a trifle below in nominal amount those given in the other counties in question piecework was paid for rather higher in Dorset. Regarding the Candelmas fair the rev. gentleman had done well to draw attention to the subject. The system of hiring there was undoubtedly wrong, and as such should be abolished if possible. He thought that the suggestion to sign an agreement not to hire there would, if carried out, have a good effect. It might be a conditional agreement. Some gentleman had thrown out the hint that those labourers who had no business at the fair should not be allowed to visit it. That, he thought, would be well to carry out, for such parties would only go to swell an idle throng. The rev. gentleman had laid considerable stress on charity. Now he (Mr. Homer) was not very fond of charity if by that was meant indiscriminate alms-giving, or he might go so far as to say even that rather of a discriminative nature. He preferred that a man should have plenty of work with good wages, to the plan of allowing him skimmed milk, or what was left in the kitchen. Respecting the proposal that every labourer should be permitted to keep a cow, he said that if such were adopted on his own farm he should have 30 cows running about. Pray how were they to be kept in winter? The labourers keeping cows would require ground for the making of hay. Mr. Homer was afraid that the plan would by no means be found a paying game in the end. He looked upon it as a step in the direction of a retrogressive policy, and recommended as a true help to the labourer the system of granting garden ground on which he might grow his own crops, which he considered rather progressive than otherwise. He approved the suggestion to establish the plan of co-operative stores, speaking of the bugbear debt which so often keeps down the labourer. Respecting drunkenness it was, he said, a sad evil, ruining many of the country people, but not to such an extent as it ruined the town people. He thought the cure for that was a judicious licensing bill, which he hoped some Government, whether Liberal or Conservative, would have the pluck to bring forward notwithstanding the opposition of the brewers. In the dwellings of the poor there had, he thought, been a marked improvement. He thought that subject must be dealt with irrespective of £ s. d. Cottages would not pay a per centage; but, nevertheless, it was the duty of the landowner to provide proper accommodation for those living upon his property. He thought the suggestion of Mr. Bennett that a cottage might be licensed to hold so many persons was well worth consideration—if a public vehicle were thus regulated, why not the cottage? But this seemed to him to affect the town population in a greater degree than the agricultural; where there was one poor helpless boy in the country requiring such protection there were 50 in the town. In the cottages of this county especially there had been great improvement; no one could take a long drive in the neighbourhood of Dorchester without seeing abundant evidence of that gratifying fact. There were, for instance, good model cottages at Puddletown—during the

past few years wonders had been done there. He did not think that in all these things they must expect to go so fast as some persons seemed to imagine. However, great improvement had been going on; he hoped they would still keep progress in view, although, perhaps, they might not find it expedient to go at railway speed.

Dr. ALDRIDGE endorsed what had been said by Mr. Genge and other speakers. There had been uttered, he observed, a great deal of maudlin sentiment with regard to the condition of the agricultural labourer. As lovers of their country it was, he thought, their duty to look forward to every link of the social chain. In his own recollection the condition of the agricultural labourer had been wonderfully improved. It would, indeed, be improved to a still more surprising degree if the romantic and Utopian ideas of some persons who knew nothing on the subject were carried out—the tenant-farmer would not be able to live. At the present time the landlord did not realise more than three per cent. on his land, and that he thought was not too much. The tenant-farmer could not afford to give an increased rate of wages, seeing that the condition of the agricultural labourer had already so much improved. He did not see any reason why there should have taken place so much excitement on this subject. There was one direction in which improvement could be effected, and that was education, in regard to which great disgrace attached to this country. Mr. Childers, recently speaking on this subject, mentioned that on passing through Germany he saw 800 recruits who had come from Berlin, and there were only three of them who could not read or write; the authorities asked why on earth that was allowed? How different the condition of things in England in this respect! Dr. Aldridge thought that while the privileges of the franchise were bestowed upon the labouring population, while their interest in the welfare of the Constitution was increased, they should be proportionately educated, in order that they might be able to adequately discharge the heavier responsibilities of their station in life. At the same time he was no advocate for an excessive education; that was out of the question—it would be productive of evil instead of good. Labourers should not be imposed upon by being compelled to pay excessively for everything in the shape of food or clothing. The co-operative system met with his cordial approval; it would, he believed, be a great boon to the agricultural poor. As to the question of intemperance, he looked with disfavour upon any plan for putting down the evil by Act of Parliament. He thought the privileges of the poor were as sacred as those of the rich. Any compulsory measure affecting exclusively the poor would, he thought, be a great hardship. The poor man often resorted to the public-house not for the purpose of getting drink, but for the sake of enjoying a little social company, and he (Dr. Aldridge) advocated the increase of attractions counter to that in question, laying particular stress on the importance of imparting a suitable amount of instruction.

Mr. G. WOOD HOMER explained it was in this way that he looked upon a licensing measure as to some extent curing drunkenness. He thought that if the ale, or the national beverage, could be obtained easily and readily over the counter in the same way as was the loaf of bread, so that the labourer could take it to his own house and consume it, that alone would obviate drunkenness. That was his reason for looking upon a licensing measure as to great extent remedying the evil of intemperance.

Mr. ANDREWS (the secretary) attacked Mr. Miall's pamphlet, exposing in some glaring inconsistencies in the statements put forth by the writer. He showed that agricultural labour is popular because of its many advantages, and defended the employers from the charges made against them, while admitting there were "black sheep in every flock." He contended that in Dorset the agricultural labourers were as well paid as in any other county. He pointed out that within 40 lines of his pamphlet Mr. Miall confutes his own argument. He did not mean to say that they had the same amount of money, but that they had advantages proportionate to money.

Mr. CHAPMAN SAUNDERS believed that the labourers in this county were as well paid as it was possible for the tenant-farmer to pay them. The value of labour depended in a great degree, he thought, upon the law of supply and demand. Respecting the hiring fair, he believed they all would be glad if it were abolished, but the question was, he pointed out, a difficult one to deal with. He suggested that the agreement should

be signed on the condition that say three, four, or five hundred other farmers did the same. It was very easy to say the fair should be done away, but in his own opinion that was not so easy to accomplish.

Mr. H. W. HAWKINS, who had been in the habit of paying by piece work, mentioned that he had given as much as 30s. per week for mowing; he strongly repudiated the statement that wages amounted to only 8s. weekly. By an amusing anecdote showing that agricultural labourers could not on one occasion which he mentioned be identified in church in consequence of their wearing black coats instead of smock-frocks, he corroborated what had been said with regard to the improvement that had taken place with respect to dress. In reference to bad language, he had not heard it on his own farm, and he did not think that farmers of the 19th century were in the habit of swearing.

Mr. GENGE expressed his opinion that no one should shrink from signing the agreement in regard to discountenancing the fair. He thought that if it were an abuse they must try to do away with it; there must be a beginning.

The PRESIDENT, in summing up the observations of the various speakers, expressed his own opinion, as a practical farmer of some 40 or 50 years' experience, that the expenses of employers were now double what they were 20 years ago, which showed plainly, he thought, that wages had considerably advanced. The cottages, too, had exceedingly improved within the last ten years. With regard to paying in kind he had himself, when wheat was down to £10 per load, tried to altogether stop the "gristing"—which the men always had—and to pay in money; but all said "No." They had two bushels to a sack of wheat monthly for their families. They had 60lbs. of wheat for 5s., so that their bread cost them only 5d. per loaf. They paid only 1s. per week for rent, besides which they had various perquisites, such as fuel, gorse, and coal. Then, too, they had "tut" work during the year. With respect to drink his own men at one time always had it at the house; but afterwards he allowed them £2 per year, and then they never came to the house at all. On the whole he thought that the price of labour was now fully 2s. per week higher than when he began business, and other things were proportionately higher; all the "tut" work was much higher. It could be plainly seen that the condition of the agricultural labourer had im-

proved considerably during the last few years. He could not see in the least why stigma should be cast upon this county as paying less for labour than was paid in other counties of England. He was certain that the agricultural population was at present in a far better state than 20 years ago. He thought they ought to thank Mr. Bennett sincerely for the able manner in which he had brought forward the subject.

Mr. DAMEY strongly recommended the Club to set a good example by signing the paper without the least hesitation.

The Rev. T. BENNETT read a letter from Mr. W. H. Dunman, of Troytown Farm, who most cordially approved of the movement, setting forth in forcible terms the evils associated with the fair. Mr. Thomas Pouncey, of No. 3, Cornhill, Dorchester, had also expressed his willingness to keep open his registry office for the purpose of meeting the wants of both employers and employed in the county. He had no doubt that at other such offices similar facilities would be offered. His brother clergymen were dead against the hiring fair, and his individual opinion was, that the movement to put it down would be more likely to succeed if it originated with the farmers themselves, and not with the clergy, who, however, would do all in their power to promote it. Now he thought was the time for action. It was better rather than cider that he recommended. As for his own practical knowledge on farming it had once been said of him "They spoiled a good grass farmer and made a parson of you." In Ireland he had found that cow keeping as adopted by the labourers there was profitable to them. [Mr. G. W. Homer: I suppose land was rented there by the mile?] His own congregation at Toller Fratrum, included many smock-frocks, which he really admired. He endorsed what Dr. Ailridge had said in reference to education. He was pleased that co-operative stores had met with their approbation. Respecting the use of bad language, they all, he said, had little tempers of their own, and it was as well to keep themselves in check.

On the motion of the President, seconded by the Vice-president Mr. Bennett was accorded a vote of thanks. The following was signed by nearly all present: Declaration against Hiring Agricultural Labourers at the Dorchester Candelmas Fair.—We, the undersigned, hereby pledge ourselves to use all our endeavours to prevent the hiring of any farm labourers or other servants at the Dorchester Candelmas Fair.

THE AGRICULTURAL LABOURER.

At the December meeting of the Croydon Farmers' Club, there was a large attendance. Mr. Robert W. Fuller in the chair.

Mr. LEVISON-GOWER read the following paper:—I have for some time felt it due to those who did me the honour to elect me a member of the Croydon Farmers' Club that I should contribute something to the many useful discussions that have from time to time taken place at these meetings, and although my friend Mr. Stables somewhat quickened my pace, I may say, with all honesty, that it had been my intention to offer to read a paper during the present season. In glancing through the subjects that have been discussed I found that that of the condition of the agricultural labourer was one that had never been before you, and although I feel that it is so large a one that it is impossible to do adequate justice to it, it is at the same time one of such vast importance to the prosperity of agriculture—in fact, I may say it so underlies the whole question—it is, so to speak, the sub-structure upon which the whole fabric rests—that I feel justified in introducing it to your notice this evening; and however far I may fall short in doing justice to it, I shall be amply rewarded if I can provoke an interesting and profitable discussion upon the question. Now, there can be no doubt that the condition of the agricultural labourer has very much improved during the present century. Whether his condition has improved in an equal degree with those of other classes it will be our business presently to inquire; as also into any causes which may exist to retard that improvement, and the remedies that may be suggested. A short inquiry into the early condition of the agricultural labourer may not be without interest at the outset. *Villainage*. Under the Saxon government there were, as Sir W. Temple tells us, a class of persons in a

condition of downright servitude, used and employed in the most servile works, and belonging, both they and their children and effects to the lord of the soil, like the rest of the cattle or stock upon it. Under the Normans their condition was somewhat improved, and the system of villenage obtained, by which, although they were annexed either to the land or to the lord of the manor, and were transferred from one owner to another, still they were under the protection of the lord, and in turn for their services received certain favours from him. The last we hear of the villein by name is in Ric. II.'s time, the end of the 14th century, and by the time of Hen. VIII. villenage had practically ceased. The process by which the labourer arrived at his present condition, viz., that of working for a fixed day's wages, was a long time in developing itself, and it is not till 1581, the time of Queen Elizabeth, that we find the agricultural labourer as he now exists beginning to appear. Some interesting details of his condition in the time of Queen Elizabeth are given by Mr. Froude, in his History of England, Vol. I. At this time, although practically a free man, and allowed at full age under certain restrictions his own choice of master, yet the restrictions on masters and servants were so severe as to prevent either from taking advantage of the necessities of the other, or from terminating through caprice, or for any insufficient reason, a connection presumed to be permanent. The English labourer of the early part of Henry VIII.'s reign is described as of a sturdy, high-hearted race, sound in body, and fierce in spirit, furnished with thews and sinews, which, under the stimulus of those great shins of beef, their common diet, were the wonder of the age. "What comyn folk in all this world," says a State paper 1515, "may compare with the comyns of England in riches, freedom, liberty, welfare, and all

prosperity? What comyn folk is so mighty, so strong in the fields as the comyns of England?" "The artificers and husbandmen," says Harrison (Dec. of England), "make most account of such meat as they may soonest come by, and have it quickest ready. Their food consisteth principally of beef and such meat as the butcher selleth—that is to say, mutton, veal, lamb, pork, besides souse, brawn, bacon, fruit, pies of fruit, fowls of sundry sorts. In feastes the husbandmen do exceed after their manner, especially at bridal and such odd meetings where it is incredible to tell what meat is consumed and spent." The Spanish nobles which came into England with Philip were astonished at the diet which they found among the poor. "These English," said one of them, "have their houses made of stick and dirt, but they fare commonly so well as the King." In this respect, I fear, there is a great falling off in the present day. Mr. Froude says that the state of the labouring classes can best be determined by a comparison of their wages with the price of food. He says that in Queen Elizabeth's time the majority of agricultural labourers lived in the houses of their employers, but still many had cottages of their own. He calculates that a penny in the time of Henry VIII. was equivalent to a shilling of our money. The wages of a common labourer in 6, Henry VIII., were 4d. a-day for half-year; for the remaining half 3d. A common servant of husbandry also was boarded and lodged at his master's house, received 16s. 8d. a-year in money, with 4s. for his clothes; while the wages of the out-door labourer in constant work would have been £5 a-year. In the harvest months they were allowed to work by the piece and might earn considerably more; mowers, for instance, earned 8d. a-day, so that, in fact, the day labourer, if in full employment, received on an average 4d. a-day for the whole year, or, in our money, 4s.; allowing him to work regularly five days a-week he received 20s. a-week, the wages at present paid in English colonies. And this was not all his advantages: he generally held land in connexion with his house, while in most parishes there were large tracts of common where pigs might range, and ducks and geese or sometimes a cow, and, from the vast tracts of forest, wood was very plentiful and cheap. During the first three-quarters of the 16th century, says the same author, the working classes of the country remained in a condition more than prosperous. They enjoyed an abundance far beyond what the same class were enjoying in France or Germany. The average price of wheat was 6s. 8d. per qr., barley 3s., beef and pork were 0½d. per lb., *i.e.*, 6d. of our money; fat oxen were sold for 26s. 8d. a piece (*i.e.*, £16), fat wethers for 3s. 4d. (40s.), fat calves the same, and fat lambs 12d.; the best fat pig or goose in a country market could be bought for 4d., a good capon for 3d. or 4d., a chicken for 1d., a hen for 2d.; strong beer, such as we buy for 18d. a gallon, was then a penny (*i.e.*, a shilling), and table-beer less than 0½d.; French and German wines were 8d. a gallon. Rent, another important consideration, is difficult to fix accurately, but in the case of the cottager it was very small. "The great criterion," says Lord Macaulay, of the state of the common people is the amount of their wages. No less than 4-5ths of the common people were in the seventeenth century employed in agriculture, and Sir W. Peter informs us that a labourer was by no means in the lowest state who received for a day's work 4d. with food, or 8d. without. Four shillings a week were, therefore, according to this calculation, fair agricultural wages. About the beginning of 1685 the justices of Warwickshire, in the exercise of a power entrusted to them by an Act of Elizabeth, fixed at their quarter sessions a scale of wages for their county, and notified that every employer who gave more than the authorised sum, and every working man who received more would be liable to punishment. These wages they fixed from March to September at 4s. a week without food, and from September to March 3s. 6d. Then, as now, the wages varied in different counties. Warwickshire may be taken as about an average, but some counties were better off. The wages in Devonshire were 5s. in winter, 6s. in summer without food. In 1661 the justices at Chelmsford fixed the wages of the Essex labourer without board at 6s. in winter, and 7s. in summer, but in this year the necessaries of life were immoderately dear. Wheat being 70s. a quarter. In the whole of Charles II.'s reign peasants' wages did not exceed 4s. Macaulay sums up thus, seeing that none of the necessaries of life have doubled in price since the 17th century, while many have become decidedly cheaper, he

concludes that labouring men were in that age worse off than at present in all material respects; that they were worse lodged, worse clothed, and worse fed. This opinion, as we see, differs very materially from that of Mr. Froude, and although both descriptions are probably rather coloured according to the bias of the writer, Mr. Froude's is, it would seem, nearer the truth. Mr. Thoroton, in his well-known work on labour, criticises with much force Lord Macaulay's statement. He says: "During the time that that historian contrasts with our own lived Daniel Defoe, the most minute, careful, and comprehensive of observers. One subject which he investigated with peculiar interest was the condition of his poorer countrymen, and his remarks disprove Lord Macaulay's. Although in Yorkshire and Durham a labourer's weekly wages might, he says, be only 4s., in Kent, and in several of the southern and western provinces, they were 7s., 9s., or 10s. Often when Defoe wanted a man for work, and had offered 9s. a week to sturdy varlets at his door, he had been told to his face that they could get more by begging; and once," says he, "I put a lusty fellow in the stocks for making the experiment." Again, he represents himself as habitually paying six or seven men on Saturday night—the least 10s., and some 30s.—for work; and he mentions one man who for several years gained of him from 16s. to 20s. a week by his handiwork, at the mean, scoundrel employment of tile making. The high wages were not turned, he says, to the best account; they were higher than in any other country in the world; but, whereas a Dutchman with 20s. a week would be sure to grow rich, and leave his children in very good condition, an Englishman could only but just live—might, perhaps, hardly have a pair of shoes to his feet or clothes to cover him, and might have his wife and children kept by the parish. But this was caused entirely by the extravagant manner of our poor people in eating and drinking, for they ate and drank—but especially the latter—three times as much in value as any sort of foreigners of the same dimensions in the world. If it had not been for the ale-house everyone might have lived comfortably, for there was more labour than hands to perform it, and the meaneast labour afforded by the workman sufficient to provide for himself and his family. These are striking remarks, written nearly 200 years ago, and may confidently be relied upon for their accuracy. "If," says Mr. Thornton, "instead of confining our attention to the end of the 16th and 17th centuries, we were to go back to the times of the Tudors and Plantagenets, we should find reason to assert still more strongly that the course of the English labourer has been retrograde instead of progressive. We should find a period at which wages were twice or thrice as high as the rulers conceived to be good for them, and when laws were deemed necessary to check their self-indulgent propensities, and to restrain their transgression in diet and dress—when, accordingly, carters, ploughmen, and other servants in husbandry were gravely admonished by Act of Parliament against eating and drinking excessively, and special statutes were passed against the using materials of clothing of higher price than might now suffice for the purchase of silks or satins. Parliament decreed that they were to be entitled to only one meal a day of flesh or fish, and directs them to content themselves at other meals with butter, cheese, and other such victuals." It seems clear, therefore, that the wages of labour estimated in money were in 1685 not more than half what they now are, and that most articles of necessity to the working man were more than half as dear as at present. Beer was cheaper, so was meat, but wheat was dearer, and the majority lived on rye, barley, and oats. Passing on to the days of Queen Anne, what I consider the condition of the agricultural peasantry was at its best, then it was, says Lord Stanhope, that the harsh features of the feudal system had passed away, while some of the milder ones remained. There was no trace of serfdom or compulsory service, but there lingered the feeling of protection due by the lord of the soil to his retainers in sickness or old age. Labour was then no mere contract of work done for value received. Service was still in some degree required even when it ceased to be performed. The enclosure of commons, which did not come much into force until George II.'s reign, have no doubt been to the disadvantage of the labouring class. Formerly whoever wished to build a cottage might squat himself down on one of the many tracts of waste which then constituted a quarter of the kingdom and build himself a dwelling, which he occupied rent free,

and to this was added a garden of no inconsiderable size, while the adjoining common supplied grazing for a cow, for pigs, or geese, thus enabling him to supplement his wages. But it will not do to be led further into the historical or antiquarian part of the subject. Our business is with the present condition of the agricultural labourer. Although from what has been said there can be no doubt that there was a time when, as a class, they were better off than they are now, still, looking at their condition as it is now and as it was at the beginning of the present century, there has been, no doubt, a marked and constant progress since that time. The close of the last century and the first 25 years of the present mark, I think, the worst epoch in his history. The price of provisions was exorbitant, the rate of wages was low, no improvement had been made in his dwelling, no provision for his education; the poor-law, such as it was, was unequally administered, the poor-houses a sink of misery and immorality. It seems to me, in reviewing the history of the agricultural labourer, that the greatest evil that has happened to him has been the loosening those ties of inter-dependence which formerly bound together the employer and employed. The majority of labourers lived formerly in the houses of their employers, and formed part of the family; a good feeling was thereby engendered, their interests and that of their employers were identical, and this no increase in the rate of wages can make up for. The system now is completely altered; the farm labourer has been almost universally turned out of the farm-house, and until lately, when something has been done to provide cottages on the farms, he has had to walk long distances morning and evening to his work. But it is on the young man—the unmarried labourer—that the change has worked most prejudicially. He has to find a lodging where he may, and this is usually at some of the worst cottages in the district, the better class of landowners as a rule refusing to allow their cottage tenants to take lodgers. His evenings are spent as a rule at the public-house, where the seeds of intemperate habits are laid for his future life, and more than all this, the want of a home has been the fruitful source of those early marriages which are the parents of so much misery among the labouring poor. So great an evil was this considered that in the middle ages a statute was passed forbidding these early marriages. We must, however, accept things as they now are. We can never expect to see the time when the labourer shall be fed and lodged as heretofore in the house of his master. We must accept the fact that agricultural labour is to be like any other labour, a mere question of contract between employer and employed; that the relation between them need not be a personal one, but simply so much work for so much wages. I shall proceed to consider the question from this point of view, and endeavour to point out the way in which I believe the condition of the agricultural labourer may be improved. It is a very general remark that farmers do not get the same amount of work out of their labourers as they used to do; in fact, that the labourer has materially and morally deteriorated. I believe this to be to a certain extent true, and various causes are no doubt at work to produce it. There is in the first place that want of interest and individual acquaintance between the farmer and his men to which I have before alluded. Many of the best hands are tempted away to the large towns by the prospect of higher wages and better hiring. There are numerous sources of employment open to them of which our fathers knew nothing, the alteration in the law of settlement, the ready means of locomotion, the spread of education—all these causes, combine to take away a good many from the field of agricultural labour who would otherwise be found there. There are very few agricultural parishes in which the labour market is overstocked, and if we look at the census returns they supply undoubted evidence of the great migration that takes place from the country to large towns—whereas in the former the population is nearly or quite stationary, in the latter the increase is most enormous. Is the same amount of labour required now as formerly on the same quantity of land? I believe not. The amalgamation of farms, the grubbing of hedgerows, and uniting of fields, the larger amount of land laid down in grass, the introduction of machinery, these all tend to reduce the number of labourers required. I am not now going into the question of small and large farms—of peasant proprietors or large landowners. I can only take things as they are. I see a general tendency to increase the size of agricultural holdings,

and to adopt machinery in every branch of farming to which it can be applied. But I am far from believing that a very general introduction of machinery will be to the disadvantage of the labourer. I believe that it will enhance his value and raise his wages. Evidence goes to show that the best drivers of agricultural engines are taken from the labouring class, and the rate of wages is 20s. to 23s. per week. It will be an incentive to the agricultural labourer to provide a better education for his children, and to keep them longer at school. If you have gone along with me far you will, I think, agree with me that the condition of the agricultural labourer is not on the whole satisfactory. We have a growing dissatisfaction among them at their condition, an uneasy restlessness which leads them to be constantly changing their situations, a lack of interest in their employer's concerns; among the lads independence, among the girls a love of finery and a dislike to hard work. How shall we bring about a better state of things? Is the following description, taken from an article in the *Cornhill Magazine* of February, 1864, entitled "The Life of a Farm Labourer," altogether a romance? is there not much truth in it? "He is taken from school as soon as he can earn 4d. or 6d. a day on the farm. He forgets all he has learnt at school as fast as other boys do. His next step is a team boy at 4s. or 5s. a week. After passing through the half dozen violent attachments which matrons denominate "calf love," he is seen one fine morning before he is 22 on his way from church with his bride, who is only 17. Their first quarters are two hired rooms, and here for a while they get on pretty well, for the husband's earnings are 14s., to which the wife on an average adds 2s. They do pretty well as long as they have only one child, but the family cares of young people are apt to increase rapidly, and in a ratio of nearly annual arithmetical progression. So in the third year of his married life they are obliged to remove into a cottage of their own, and find themselves a few years after with half a dozen children to maintain, with rent and fuel to provide, and clothes to be paid for. Hard is the struggle, and hard the life the parents lead in consequence. A bit of bacon is the nearest approach to flesh meat ever seen in the dwelling; and bread and cheese and an onion, washed down with so-called tea, as often as not his principal and midday meal. Being disabled by hard fare and exposure he is at 50 years of age no longer worth 2s. 6d. a day, and is reduced to 2s., then to 1s. 6d. Then follows sick and the benefit club, to which he had formerly subscribed, having broken up, his only resource is to apply for out-door relief, to be exchanged shortly afterwards for an asylum in the sick ward of the union. Once within those walls they are there for life. They have sold their furniture and must make up their minds to wait patiently, until death shall come to set them free." It was long ago remarked by Sir Josiah Child, that to benefit the condition of the poorer classes was deserving the most serious consideration of our wisest counsellors, "and if a whole session of Parliament were employed upon this singular concern, I think," says he, "it would be time spent as much to the glory of God and good of this nation as in anything that noble and worthy patriots can be engaged in." The remedies that I shall venture to suggest are not legislative enactments (in such matters I am no believer in legislation); they will be such as tend to improve their condition morally and physically, and such as lie within the reach of almost every owner of cottage property or employer of labour. Before all improvements, whether in men, dwellings, their education, or their rate of wages, I look to the cultivation of a friendly feeling between the employer and employed. One of the great evils that we have to lament in the present day is the estrangement that exists between the classes. When the work is done and the wages paid it is considered that the obligations have been fulfilled on both sides; there is no personal intercourse between the families. How often as soon as the labourer is thrown out of work his wages are immediately stopped and he is cast upon the rates, when in the case of a mere temporary ailment how much kindly feeling would be engendered by the employer continuing to pay the wages! Can it be wondered at that under the circumstances complaints should be made of the constant change of situation, or that the labourer, on the chance of bettering himself, should change his employment? Foremost among the improvements always suggested is that of providing the labourer with a comfortable home at a moderate distance from his work. The moral and physical

condition of the labourer is very much determined by the state of his home; if we would draw him from the public-house it must be by his having a comfortable home to go to after his work—a home in which he can take a honest pride. Lord Shaftesbury (and no one can claim to speak with greater authority) remarks that of all the physical questions which affect the condition of the labouring classes, there is no one point of so much importance as the condition of the dwelling-places where they and their families reside. There can be no question that of late years great improvements have been made in the matter of cottages, especially upon the large estates. The difficulty, however, which underlies the whole question, and seriously interferes with its further development, is that of expense. It has not yet been shown how superior cottages can be built to let at such a rent as a mere agricultural labourer can afford to pay. Cottage building can be rendered profitable in towns, because houses can be built relatively cheaper by building them in a row, and they will always command a large rent. But in country districts it is not so good. A good pair of cottages, detached with suitable offices, cannot be built under £300. The highest rent that I consider a labourer in receipt of 13s. or 14s. a-week is capable of paying is 2s. a-week, or £5 to £5 5s. a-year. Now the lowest rate of interest which a builder expects is 6 or 7 per cent. upon house property; this would give £18 per annum, whereas the actual rent is £10 10s., or only 3½ per cent. Then to that has to be added a poor-rate of some 10 per cent., and it will be seen that the real drawback in the way of cottage improvement is expense. Several letters have lately appeared in *The Times* between Mr. Granville Ryder, the Secretary of the Lands Improvement Commissioners, and Mr. Walter Compton, one of the Agricultural Commissioners, in which the latter pointed out, and I think very truly, that the money offered by the Lands Improvement Society had not been taken advantage of by landowners as it would have been, owing to the stringent requirements. In the first place they require three bed-rooms in every case, and it is manifest that this cannot be necessary. Secondly, they will not allow any money in repairing or adapting old cottages, whereas it is very well known that some of the most comfortable cottages can be made out of old dwellings by additions and alterations. These causes no doubt operate to interfere with the usefulness of the society, and I trust that in time they may see fit to relax the stringency of their rules. I may claim to speak with some experience about cottage building, having this year completed the 20th cottage I have built on my estate. They do not pay above three per cent., but there are indirect advantages which to a great extent make up for the outlay. The farmer is able to obtain and to keep a better class of labourers, and the value of the farm is thereby increased. It must be a manifest advantage both to the labourer and his employer, that the cottage should be on the farm; but this is introducing a new system, and it is clear that a long period must elapse before the improvement in the cottage dwellings of the poor can be carried out to the extent which is desirable. Mr. Cullley, in his second report, quoted by Mr. Dent (*Art R.A. Journal*), says, "We are calling on the landowners of to-day to remedy the evil growth of many past generations, and 9-10ths of those who reside in the four counties I have visited, are already busy at the work as far as their means will allow. I could point out two very large estates in these counties (*i.e.* Derbyshire, &c.) upon the general improvement of which, cottages having a large share, the whole income has been spent for many years past." Mr. Dent says, "English landlords will not shirk their work, and they are generally recognizing the improvement of cottages as a part of their duty essential for the good cultivation of the land, as well as for good morals, and every one who travels through the country sees not only commodious farm buildings, enlarged fields, and higher cultivation, but also well-built and commodious cottage dwellings rising among the squalid homes which even yet disgrace our land." I confess I wish that the act which relates to the condemning certain houses in great towns as unfit for human habitation, and orders their repair or demolition, could be extended to the country districts, and especially I wish that some remedy could be brought to bear upon that system of overcrowding, which is not only detrimental to health, but undermines the morals of the working classes. The next essential in my opinion is that

the cottage should have a good garden attached to it, and this in country districts can be done at very little sacrifice. So important was it considered formerly that the cottager should have a good piece of land attached to his house, that an Act was passed in 31 Queen Elizabeth, enacting that no cottage should be erected without having four acres of land attached to it. This enactment fell in disuse, but we must have observed I think, in many instances, what a large garden some of the old cottages have attached to them, and for this reason how the poor cling to them even where they have ceased to be fit for habitation. About a quarter of an acre is the quantity which a labourer can be expected to cultivate without neglecting his master's work, and this, well cultivated, will supply his family, if, as is now frequently done, a small piece be allowed him on the farm for potato ground. Very good results have been obtained in many cases by giving as much as half an acre of ground, and planting some fruit trees therein. In a good season the crop very often suffices to pay the rent. Where, as in the case of villages, it is impossible to obtain a garden attached to the house, the difficulty can be met by providing allotment gardens, though this is in many respects far less satisfactory than the cottage garden. The plot of ground close to the house is a source of pride and enjoyment to the whole family, and involves no extra walking after a hard day's work. The walk to the allotment ground very often involves the stopping at the public-house on the way back. The practice now so common of having cottage garden exhibitions annually, and awarding prizes for the best fruit and vegetables, is attended with the best results, and one of the most useful features is the prize given for the best cultivated garden. Another custom, which is almost confined to Derbyshire, Shropshire, and Cheshire, of the cow run or grass allotment, is the greatest boon to the labourer. I have had some experience of it in the latter county, and in one village I am acquainted with it is universal. In these districts it is quite common for an ordinary day labourer to rent as much grass as will keep one cow, the plots extending in size from five to ten acres, and these are not in any sense small farmers, but mere daily labourers. The cow is looked after by the wife, and the annual value is set at about £12. The importance to the children of a supply of fresh milk cannot be over estimated. These counties of course stand in a peculiar position from the abundance of pasture land, but I cannot help thinking that on grass farms the same system might be tried, the cottagers paying for the keep of the cow and receiving the milk. I am sorry to find that there is still a great prejudice among many farmers against allowing the cottagers to keep pigs. I am a strong advocate for it myself. The pig represents a species of sinking fund, and when he comes to be killed he is such a help to the family, and the day of his death is a little innocent festival in the household. More than all, he is important in furnishing manure for the use of his garden. I know the arguments that are used against it—the temptation it offers for petty thefts; but surely a labourer, if he is worth anything, can be trusted. Next in importance to the labourer's home is that of his education. This question of education of the agricultural labourer has been, and will long continue to be, a very perplexing question. Owing to many village schools being of necessity mixed schools to a certain extent, that is to say, consisting of tradesmen's children and children of parents in a higher condition, it is maintained by some that the kind of education given is not the best suited to his future condition in life; in fact, we have all heard it asserted gravely that his inferiority to his forefathers is owing to his over-education. That this is a great fallacy, and merely used by the enemies of education to throw discredit upon it, it would be easy to prove; but were we to admit the truth of it, should we as employers of labour be justified in keeping back from the young of our villages that which both here and hereafter tends so directly to their happiness? It augurs ill for the relations between the employer and employed if they are only to be cemented and rendered safe by the bonds of ignorance. There is no doubt that if it were possible to carry it out, something of a technical education, and not only the three R's, would be of great advantage to our labouring poor, and more especially in the case of girls intended for domestic service, that they should be trained to wash, iron, and work well with the needle. This is done in some cases, and with very good results. Our forefathers recognized the importance of this kind of education, and we find in Henry VIII.'s time an enactment which empowered

the parish officers to take up all idle children above the age of five years, and appoint them to masters of husbandry or other craft or labour to be taught. I think that in the course of a few years we may expect to see a great improvement in the education of our labouring poor. I hail the late Act as a great step towards obtaining good national education for all classes. The state has now distinctly recognized its obligation of enabling all classes to obtain a sound elementary education, and the importance of the compulsory clauses cannot, I think, be over-estimated. The country owes a great debt of gratitude to the clergy for their exertions in the cause, and in many parishes had it not been for them education must have languished altogether. But in many cases under the old system education was too much a matter between them and the village-school children—it was too personal a matter—the farmer and other residents in the parish had nothing to do with it, and probably never went inside the school. The only way, I conceive, to have a good system of education is to interest all classes in it, and the only way to do this is to make them contribute towards the expenses of it and have a share in the management of it, and this, under the system of school boards, will be accomplished. One of the principal difficulties which lies in the way of giving our agricultural poor an efficient education is the early age at which they are taken from school. Various remedies have been suggested for this, such as half time—that is to say, working half a day and attending school the other half, or attending schools so many weeks in the year and working the others; but both these are difficult of accomplishment. The only efficient mode is for the employer of labour to discourage very early labour in the field. The temptation to the poor man with a large family is of course very great to get some of them out as soon as possible, and for this reason very often out of kindness—often mistaken kindness—the farmer takes them on to mind birds or sheep, or something of the kind just when they ought to be at school. It is, of course, difficult to fix the exact age at which a boy should be put to farm-work, but in no case should it be under 10, nor should he work more than 10 hours a day between 10 and 14, and it would be very desirable if it could be delayed as late as 12, exception of course being made at haymaking or harvest, when there was a special demand for hands. Upon this point of age all the agricultural commissioners were agreed that the reasonable limit to fix was 10 years. We state that juvenile labour is very valuable to the farmer, but that under 10 years of age it is not indispensable—that the earnings of the children are very useful to the parents, but that children under 10 hardly do more than pay for the extra food and clothes which they require when at work; that education is very valuable to the children; that between five and ten they may have acquired an adequate knowledge of reading, writing, and arithmetic, but if removed earlier it cannot be so. That the state of education in the south is far below the standard of the north must be admitted. In Scotland, where the parents themselves are educated and understand the value of education, the education of the children is carried on at home. With us, I fear, it begins and ends in the school. Lord Grey, who has an intimate acquaintance with the labourers of Northumberland, told me that he never knew a single instance of an agricultural labourer who could not read and write, and the same with some modification may be said generally of the condition of the peasantry in the north. I have little doubt but that the extension of machinery in agricultural operations will tend to set a higher value upon education; that as a matter of self-interest labourers will educate themselves sufficiently to obtain the highest prizes which agricultural labour holds out. Mr. Jacob Wilson, the manager of the Northumberland Steam Cultivation Company (quoted by Mr. Dent), speaks of the rise in wages under a system of steam cultivation. He says, "I find we are at present employing about 90 men, and of these about 60 were formerly ordinary but intelligent farm labourers, receiving 14s. or 15s. a week. They are now making 20s. to 25s. But you must remember that all our farm labourers down here are well educated." Mr. Stanhope, one of the commissioners, gives figures in support of the same facts, and Mr. Dent in his paper confirms the statement that the use of steam power in agriculture is accompanied by a substantial increase in the wages of the men employed in connexion with it. Having spoken now of the two principal elements in the improvement of our labouring population—the better home

and the better education—I must say a few words on one or two points which I think tend to check the elevation of the class as a whole. Good as was the object of the framers of our Poor Law, and difficult as it would be to point out any better system, I can hardly doubt that its tendency has been to check that feeling of self-dependence and respect which is so essential to the well-being of the agricultural labourer, and in many cases to pauperize a great number of the population. Had the law been differently administered from the first, had a more strict rule been adopted in respect to out-door relief, had the workhouse test been rigidly enforced, it might have been otherwise; but into that I need not stop to inquire. I am afraid that the facts are as I have stated, and that the poor have got to regard parochial relief as in the nature of a sick fund, to which, in sickness or want of work, they may have immediate resort, and that among too many of them there is no sense of shame in being on the parish books or in looking forward to ending their days in the union. Several of the commissioners appear to think that the poor would make more use of clubs if it were not for the influence of the Poor Law. Many industrious and deserving labourers, says Mr. Stanhope, appear to be discouraged from making the effort to secure independence by self-help from the fear of losing their presumed right to relief from the poor-rate, and the guardians have no fixed rule by which to determine such cases. Sometimes they consider the receipt of club allowances a bar to parochial relief, and sometimes they do not. Mr. Norman wonders that the poor ever do practice self-denial for the sake of a maintenance in old age when the Poor Law will give it them without, and feels sure that this has a direct tendency to weaken those feelings of self-reliance and independence among the labouring classes, on the development of which qualities the amelioration of that class must necessarily depend. It is most important, I think, that in administering relief, boards of guardians should recognise the claims of those who subscribe to benefit clubs to a more liberal allowance. In many cases this is now done, some counting what they receive from their club at only half, others at one-third, and this, if universally adopted, would tend greatly to encourage habits of thrift among the poor. It is, I think, very much to the credit of the labouring class that many of them are members of benefit societies. The commissioners as a whole, however, report very unfavourably of these benefit clubs, and I am afraid it must be allowed that in many cases they are little better than public-house clubs, and the custom of breaking them up at stated periods and dividing the funds operates most hardly in the case of the aged subscribers. Something has been done lately to bring these clubs and their rules under the operation of the law, but I think that the rules laid down ought to be more stringent still. One of the best managed of these is the Hampshire Friendly Society, which grafts upon the ordinary business of a benefit society the system of deposits. Of all the injurious influences to which the labourer is subject that of the public-house and of drink is the most noxious. It is at the public-house that the wages are spent, that the bad company is met with, that the misery of home is caused, that loss of character and health is acquired; but as it is the most wide-spread and pernicious, so it is the most difficult to cure, the attractions are so great—the warm fire, the bright lights, the company, the absence of all those discomforts which are to be met with in so many cottage homes. These are inducements too great to be withstood. The cry is for legislation, but how difficult it is to legislate on the subject the events of the past session have taught us. That the multiplication of public-houses does multiply the temptations of the labourer to drink cannot be denied, and it is possible that some good might be done by a gradual reduction in the number of public-houses. I believe also that shops for the sale of beer not to be drunk on the premises might be multiplied with advantage, under several strict regulations as to the way in which the business was conducted. We do not wish to deprive the labourer of his beer, but we wish to remove out of his way the temptations to spend his hard-earned wages at the public-house. Mr. Kettel considers that a system of this kind would tend greatly to diminish drunkenness, and I must say I think there is a great deal to be said for it. Mr. Cully, one of the commissioners, in his report says: "I do not desire that the labourer should be denied every facility of quenching his thirst in beer; on the contrary, I should like to see beer sold across every counter with as little restriction as bread and butter, save only that it

should not be drunk on the premises. Under such a system a man would probably take home to his family only so much beer as he could conveniently pay for, and he would be robbed of the temptations to excess which it is the business of the beer-house keeper to provide. I wish for my own part that the system of giving beer or cider at harvest or haymaking would give place to the far better custom now generally adopted in the midland counties of giving it all in money. A great deal more liquor is consumed in many instances than is required, the work is done none the better in consequence, and the man who would wholly or in part abstain that he might take the extra money home has no chance of doing it. The same money spent on food would go much farther and be much more beneficial. I am willing to believe that there is not more, perhaps not so much, drunkenness among the working classes as there was formerly, and, speaking of our own part of the country, I think I can state it to be a fact. But still in the absence of actual drunkenness, what a vast amount of money finds its way into the hands of the publican! It is reckoned that half of the money spent by the labouring poor on drink is improperly spent. We are on the eve of some alteration in the law in respect of public-houses, and in any measure that is introduced I hope the right of the inhabitants to determine the number of houses that may be required for a district will be duly recognized. There are one or two other points affecting the condition of the agricultural labourer on which I might touch, such as the public hiring at the statute fair or the gang system, but these bid fair to become things of the past, and are generally condemned by the more healthy public opinion which prevails at the present day. As neither system fortunately obtains in the South of England, they have no special need to be commented upon. The question of female labour is one upon which the opinions of the Agricultural Commissioners, as of most other persons, are widely at variance. It may, safely, I think, be asserted that while it cannot be altogether superseded, nor is it desirable that it should (such employments as haymaking and bop-tieing and other light work being well suited to women) their work should be reduced within the smallest possible limits, and be confined to the better season of the year. The woman's place is with the home and looking after the house and children, both of which suffer by her constant absence at field work. Although in the north it still exists to a great extent, throughout the country generally female labour is very much on the decline. It remains for me now briefly to sum up the remarks that I have made. I have taken a rapid glance at the past history of the agricultural labourer, and from this I think we have seen that his present condition is in many respects not so favourable as it was two or three centuries ago. On the other hand, it is a hopeful sign that of late years it has improved, and is still improving. I am sanguine enough to hope that under an improved system of farming and a more general introduction of machinery, there will be an opportunity for the better class of labourer to earn a higher rate of wages, and to this we look as one of the principal means of bettering his condition. These changes may be of slow and gradual growth; they will be wrought independently of us, by the force of circumstances. The obligation meanwhile is perpetual upon us, the employers of labour, to cultivate friendly relations with the labourer, and to do all that lies in our power to better his moral and material condition. Mr. Nicholls puts this well in his paper on Agricultural Labour (in R. A. S. Journal, 1866). "It is surely our duty," says he, "to impart all the improvement of which the labourer's condition is susceptible, to strive to increase his comforts, and to endeavour by every means in our power to make him happy and contented in his position. No one will deny that the labourer is as necessary to the employer as the employer is necessary to the labourer; each is, in fact, essential to the other, and the kindest feelings should be mutually cultivated between them." What says Lord Shaftesbury to the same effect? They are noble words, worthy of their noble author, and with them I may fitly conclude: "We owe to the poor of the land a weighty debt. We call them improvident and immoral, and many of them are so; but that improvidence and immorality are the results in a great measure of our neglect, and in not a little of our example. We owe them, too, the debt of kinder language and more frequent intercourse. This is no fanciful obligation; our people are more alive than any other to the honest zeal for their cause and sympathy with

their necessities, which, fall though it often may, on unimpressible hearts, never fails to find some that it comforts, and many that it softens. These men appeal to us with every claim of justice, service, and affection. They and their fathers have tilled our fields; they have replenished and still replenish our armies; and often have I heard the great Duke of Wellington declare that all his ability and courage would have effected nothing had he not been called to command so noble a material as the British labourer. Such service they have rendered once, they may be summoned to do so again, and surely then we shall find our account in a vigorous and loyal peasantry."

Mr. JOS. DAVISON said he believed Mr. Gower's suggestion as to the cultivation of better feelings between employer and employed was one of the best means of remedying the present unsatisfactory state of things. As to the improvement of labourers' cottages, that was a question for the landlord entirely, and he believed the tenants would be found willing to pay a fair interest for any money laid out in that way.

Mr. WALKER said the labourers in this part seemed quite different from those in Yorkshire, where they took a pride in their cottages, and on Sundays dressed up and went to church. He did not think there was in the south sufficient grass land to allow the men to keep a cow; but he always let his men have a certain amount of new milk every day. He also gave them a piece of land for potatoes, and sold pork at considerably less than market price; and altogether he and his labourers got on very well together. At the same time, the men in this part were not so well educated and brought up as in Yorkshire.

Mr. CRESSINGHAM believed it would be a great advantage if on large estates some central and suitable home for the young men could be provided to keep them away from the public-house.

Mr. TAYLOR (Wickham Court) said: The agricultural labourer desired and meant to improve his condition, and it was the inclination of landowners and tenant-farmers to help him to do so. They wished to see him happy and comfortable, because otherwise they could not be happy and comfortable themselves. The two great things requiring attention were domestic comfort and education. In the absence of a comfortable home a man was apt to lose his self-respect, and, consequently, his respect for others. Education without home comfort would lose half its influence and value. He was not in favour of giving agricultural children a fancy education, but would give them sufficient education to enable them further to educate themselves, and raise themselves in the social scale. As to cottage building he believed, with Mr. Davison, farmers were willing to pay a further per centage for any such outlay, and serious responsibility was upon the landed proprietors in regard to that matter. It was quite true, what had been written by Mr. Culling, that the landed proprietors of the present day are expected to perform not only their own duties, but the duties which their predecessors had neglected. Some of them were in a position to go into the matter thoroughly, and others were not, but at all events it must be admitted that both in England and Scotland a large proportion of the proprietors were now doing their duty to the best of their ability, to better the existing state of things. He joined in the thanks to Mr. Gower for his kindness in giving them such an excellent paper, and they gave him credit for the higher motive of desiring to promote as much as possible the welfare of a class of men very much dependent upon him.

Mr. STREETER asked Mr. Davison if he thought there were many agricultural labourers in a position to pay £12 or £20 for a cow; and if they got the master to advance the money, what security had the master got, supposing the man drove the cow to market and disposed of it? Then again, as the labourer could not keep his cow separately, it would have to be kept with the master's, and if so how would the labourer know when to leave off milking his master's cow, and when to begin his own? The temptation would be to milk another man's cow longer than one's own. Then as to keeping pigs, it might be a temptation to the labourer to go to the barn for a little corn; and it would be a better plan to sell the labourer pork at a reduced price, as was done by Mr. Walker.

Mr. DAVISON, in reply to the first question, said the cow would not be the property of the labourer till he had fully paid for it; so much per week would be deducted from his wages till the value was paid before the property in the cow would be transferred. As to the temptation to rob the master he could only say that on his family's farm in Noathumber-

land, where the men had kept cows and pigs for the last 150 years, not a single case of peculation had ever come to light, and he believed if the men were treated in the same way here they would be as honest. Moreover in the north a part of their wages consisted of corn, and hence they had no temptation to steal it.

Mr. STACEY thought payment in kind an antiquated notion, and that in future labourers must be treated on the fair commercial principle of paying them what they are worth. They must be paid as much as possible by the piece, and in that way the best workman would get the best pay. He was in favour, where practicable, of the man keeping his pig, because it consumed the garden waste, and supplied manure to produce the next crop; he agreed that there ought to be improvement in the cottages, and that with regard to the single labourer, as farmers could not go back to the old times when he lived in the house, some place should be established where the single labourers could live. On large farms it would be quite possible to have a house for them, kept by a respectable middle-aged woman. He would object to three bed-roomed cottages, because that would hold out a temptation to the occupier to take lodgers.

Mr. BARLING advocated the establishment of savings' banks, on the ground that the men are willing to save, but do not quite know where to put their money. They had answered well in Wiltshire.

Mr. LEVESON-GOWER, in reply, favoured Mr. Stacey's idea of payment by piece-work, as then the race was to the swift and the battle to the strong. It was very depressing to a

superior man to find himself paid only the same as the inferior. Still, there was so much work on the farm that could not be done by piece that that mode of payment could not be systematically introduced. In regard to Mr. Cressingham's suggestion of a lodgiog-house for the single men, that might be tried, as he knew it had been in one case, on large farms, and on the smaller farms the third room of the three bed-roomed cottages, condemned by Mr. Stacey, might often be available for lodging the single men. He agreed with Mr. Stacey that payment in kind was becoming obsolete; and although it was no doubt successfully carried out in the north, it was not a system that they would introduce where it did not already exist. At the same time, he thought modifications of it might be usefully introduced here, such as allowing the man to keep a cow or pig, or allowing him so much milk; it was an encouragement to him, and gave him more interest in his domestic affairs. The administration of the poor-law had a great bearing on the labourer's condition, and he thought boards of guardians should be very zealous to the giving of out-relief, and should be more ready to encourage those who, by paying into a friendly society, had shown a disposition to help themselves. He also approved Mr. Barling's suggestion as to savings' banks, and knew of cases where the employer had sometimes taken care of the men's savings for them for the year. The labourers would generally be found willing to save; they only wanted to know how and where to deposit it.

Mr. W. J. WILSON moved, and Mr. STABLES seconded, a vote of thanks to Mr. Gower, which was carried, and acknowledged.

BEDFORDSHIRE AGRICULTURAL SOCIETY.

DISCUSSION MEETING.

At a meeting of this Society held at the Swan Hotel, Bedford, under the presidency of Mr. James Howard, M.P. There was a large attendance, numbering over sixty, and the meeting was considered of unusual importance in the history of the Society, as being the first convened for the discussion of practical subjects connected with farming.

The CHAIRMAN, in opening the proceedings, said he was happy in the first place to congratulate the Society upon entering upon a new phase of its history, and also on the large and respectable attendance he saw before him on this occasion. By its annual shows the Society had contributed in no small degree to raise the condition of agriculture and of the agricultural labourer throughout the county, but hitherto it had afforded its members no opportunity of interchanging opinions on topics relating to the science or practice of agriculture. This was pre-eminently an age of discussion. Every subject of public interest was brought to the bar of public opinion, but the farmers of England were not at all behind other bodies, for they had their Chambers of Agriculture and their old-established London Farmers' Club, than which no organization perhaps had contributed more to the advancement and improvement of agriculture in this country. It was not every farmer, however, who could afford the time or cost of going to London to attend these discussions, and therefore the committee of the Bedfordshire Agricultural Society had determined to hold periodical discussions of this character. He would now call upon his brother to read the paper which he had prepared.

Mr. CHARLES HOWARD said that farming, farm labourers, land-laws, and land questions generally, had received of late more than ordinary attention. Statesmen and eminent landlords had written and spoken upon them; Social Congresses had thought them worthy of debate; while political economists had on various occasions favoured us with their theories. With some of the latter the remedy for many of England's evils was the subdivision of our large domains, and parcelling out the country into small farms; but if these gentlemen would point him out a large territorial estate where large and moderate-sized farms prevailed, then he would show them where the most corn and meat was produced, a fact which the consuming classes of

this country ought not to lose sight of. The farmers had no wish to see the Lords abolished, nor their ancestral estates cut up: on the contrary, they thought it would be better for the agriculture of the country if the land had fewer owners. Their irrepresible and lively friend, Mr. Mechi, had of late inundated the press with his letters. Those who knew Mr. Mechi appreciated him very much for the kindness of his disposition and his desire to benefit agriculture, but the fact could not be disguised that in most of his letters there was an evident leaning to the landlord at the expense of the tenant. Take the question of the over-preservation of game, which had been the ruin of hundreds of farmers. When tenants complained of the injury done them, Mr. Mechi bade them farm the best and highest where the most damage was done, viz., about the coverts, or to run wire fences all round the fields, a course which some would pronounce as "adding insult to injury." A very good farmer, not far from Bedford, had tried this plan, but very soon had a notice to take up his wire fence or a notice of another form would be the result. Mr. Mechi had access to *The Times*, and with such an advantage, instead of schooling the tenants he might do vast service to agriculture and to the country by drawing attention to the fact that the land can never be made to produce its proper amount of corn and meat until landlords either grant leases, or (still better) agreements, subject to two years' notice, with compensation clauses for unexhausted improvements. Men of capital and skill would not take land under sharp landlords, subject to a six months' notice to quit. This was a question which concerned the consuming classes more than they at present realised, and the high price of meat was partly the penalty of such a state of things. Agriculturists intended that their agriculture and their various breeds of animals should continue to be the boast and admiration of the world, and he trusted that the reading of papers on such occasions as these, followed by practical discussions, would lead to so desirable a result. This movement, he remarked, had been frequently suggested by their late lamented friend Mr. James, of Cople, but it was reserved for the year of presidency of the Chairman, who had brought the subject prominently before the Society, for the movement to be inaugurated, and he (Mr. C. Howard) appeared before them, at the request of the Com-

mittee, to open the first discussion. In a carefully prepared article in the *Mark Lane Express* of Nov. 20, it was estimated that the annual value of the corn crops alone in Great Britain was over £80,000,000, and that the annual value of all agricultural produce in Great Britain and Ireland is over £300,000,000, facts which those who were in the habit of depreciating agriculture would do well to study. Of late years the harvest had become a most anxious and trying season, the farmer needing much grace and patience. Our labour supply is no longer what it was. Those itinerant bands of Irish reapers who came yearly to cut down our harvest, either remained at home, or had left their country—in some instances, doubtless, “for their country’s good.” Nor did other portions of our population turn out as formerly for the harvest month. The continued extension of railways, the opening of ironstone quarries, and the great prosperity of the building and other trades, had drawn largely upon our agricultural population, and would continue to do so until farmers competed with them in the price paid for labour. Hitherto the farmer had proved equal to the emergency of his position, though at some considerable cost. His wants and requirements had brought into existence during the last 25 or 30 years gigantic manufactories of agricultural implements, and those who remembered the early meetings of the Royal Agricultural Society could bear witness to the enormous increase in this branch of its proceedings. Although farmers rarely made fortunes, many had been made out of them; but they honoured the men who had so prospered, and during the last harvest many a thanksgiving went up for the reaping machines, without which much corn must have been in the fields at this moment. The farmer was therefore fully alive to the fact that he must fly to machinery to meet the scarcity of labour. The labourer had gradually withdrawn his opposition to machinery, as he found the hard work done for him, and thanks to public opinion the opposition to it on the part of the landlord had nearly died out. He (Mr. C. Howard) had only heard of one case last harvest where a tenant was forbidden the use of a reaping machine. This good man came and told him (Mr. Howard) his troubles. He had 50 acres of wheat which required cutting, and scarcely any men to do it. I asked him whether his landlord expected his rent (laughter). He replied: “Oh yes, and no mistake.” I then said: “Are you an Englishman?” “Oh yes,” he replied. “Well, go home and act like one; use your machine at all hazards.” His reply was—and I would have those who have any doubt about the propriety of an equitable Tenant-Right mark it—“I should have no hesitation, but I have laid out a good deal of money and if I offend I can be got rid of by a six months’ notice to quit.” To men of this class, and others opposed to the introduction of machinery, I will use the expressive language of the great Mr. Cobden. Of course it did not suit us at the time as it was applied to the agricultural interest in their opposition to free trade. “To check it,” said he, “you are as powerless as a cork upon the cataracts of Niagara.” In tracing the history of the reaping-machine from the earliest period to the present time, to make the farmers happy they required a companion machine to tie the corn up. The reaping-machine most in favour was the two-horse side sheaf delivery, but on most farms in this neighbourhood reaping machines were used of one make or another, and various were the methods in which the harvest was conducted. Nine farmers out of ten let the work in one form or another, but a few preferred the old system of engaging the men by the month, others preferring to let the whole of the harvest. By far the greater number, however, merely let the cutting and tying, charging a price per acre for the machine, the remainder, with the exception of thatching, being done by the day. He thought it preferable to put the machine in the hands of one of the best men, who should be rewarded for extra exertion and care of machine; the tying, shocking, and dragging to be let either to their own men or to strangers. He thought it desirable that a field or large portion of a field should be cut before the men were put in it; by this means the men could be placed in as many companies as the master might prefer. By placing a large number of men together the good man would be reduced to the level of the indifferent one. Great vigilance, however, was necessary on the part of the master. Valuable as the horse-drag was, he had seen great mischief done by its too free use, especially on clay soils, too much dirt being collected by it. He thought the hand-drag should be used only over

the whole of the land at the time of shocking, its gatherings tied up in bundles and stacked separately, the horse-drag giving the finishing stroke after all was carted. As to the stack, he thought that there should be sufficient in it for a full day’s work with the thrashing-machine. He inclined to the oblong shape with the hipped roof, or the old hovel without its stand or frame, the size he preferred being ten yards long by five and a-half yards wide. Much damage was often sustained by the roofs of stacks not being properly built, many stackers not taking sufficient care to keep the middle full so that the outside sheaves should shoot off the rain rather than conduct it into the stack. It was a great boon to the farmer to have in his service some good stackers and thatchers, and these men deserved every encouragement. He regretted that the funds of the Society did not allow them to continue prizes for these operations. He also thought it desirable to place the stacks in several convenient spots on the farm rather than all together. In case of fire it was not right to the insurance office, nor was it good policy to risk the destruction of the whole of the hay and straw of a farm. A labour-saving machine was being gradually being introduced in the stacking of hay and corn—he alluded to the elevator. During the last harvest he had applied a one-horse gear to his ordinary straw-jack, and had used it with considerable advantage in the stacking of barley, saving at least two men on a stack. He believed they were made also for carrying up corn in a sheaf, and he did not doubt they would come into more general use. Now, as to thatching. In the course of his 25 to 30 years’ experience he did not remember so much damage being done to stacks as by the 4-inch rain-fall during the latter end of last September. On his Bromham farm, on which the harvest was a week later than at Biddenham, he was a considerable sufferer, and he was sorry to say he had many “partners in distress.” He longed for some quick temporary mode of covering. He envied his friend, Mr. Joseph Robinson, of Clifton, and the proprietor of Luton Hoo their extensive corn-sheds. Mr. Robinson has a double shed 60 feet long by 40 feet wide, and 17 feet high to the plate, capable of holding from 200 to 300 quarters of corn, which cost £180; he has another the same length but half the width, and so satisfied is he with them that he intends building another or two next summer. Mr. Robinson said, in his letter to him: “I would not be without them for double their cost. They are better than any barn, and make the farmer very independent of the weather both in harvesting and thrashing.” The corn-shed at Luton Hoo is of immense size, and this, together with the farm homestead, is one of the sights of Bedfordshire. There were some rich landlords who doubtless would erect a few such buildings by receiving interest for their money, and it was pretty clear it would answer a tenant’s purpose to pay it. The cost of thatching was very considerable each year; but he would not dwell further upon this subject, preferring rather to devote his attention to the beer question, which had been so long a source of trouble and annoyance to the farmer. From all he could learn, the farmers of Bedfordshire were more hampered by this custom than those in most other counties. Money payments, all the year round, had been substituted by one or two gentlemen, but he had personally long wished to see his way out of the difficulty, and he confessed he had not yet done so. So long as the present drinking customs remained, his only fear was, if the masters did not provide a good wholesome beverage, that the man would introduce on the farm and at all hours the frightful stuff of the nearest beer-shop, the result being that the work would be neglected, and that the man would be rendered half mad. Money payments might, however, be introduced among the boys, and he would advocate liberal payments too. He had often felt condemned in giving little boys so much beer. He thought that if they could see their way to a new great coat at the end of the harvest they would be well pleased to forego their beer. He had no doubt that by the time the boys who were to receive the benefit of an improved education became men, the substitution of money payments for beer would be the rule. This led him, in conclusion, to refer to the condition of the agricultural labourer. One farmer-member, and long may he remain so—Mr. C. S. Read—in his address to the Farmers’ Club only the other day, and Mr. Dent, M.P. for Scarborough, in an article in the last volume of the Royal Agricultural Society’s *Journal*, have both done good service in placing before

the public the true position of our labourers. Both articles are worthy of every farmer's perusal. No man, in my opinion, is more rapidly improving his condition than the agricultural labourer. The heavy work of the farm is now done by machinery. The flail is preserved as a relic of a barbarous age; the scythe and sickle are gradually disappearing; yet the agricultural labourer is at this moment receiving more for his work than at any former period of his history. I do not for a moment think it will compare with that of the higher class of artisans. But if the following advantages are taken into consideration—his piece-work, his extra wages in hay-time and in harvest, his allowance of beer at a weekly cost of 1s. 6d. the year through, his cheap cottage and exemption from all rates, his garden and allotment of land of a rood to half an acre, together with the gleanings of his wife and family, the weekly income of a steady agricultural labourer will compare favourably with that of the lower class of artisan. Perhaps you will think it a bold assertion, but I verily believe that according to numbers employed, I can find a greater proportion of men on my farm than my brothers (Messrs. J. and F. Howard) can at their works, who will change you a sovereign on any day in the middle of the week. As to the nine-hours movement, of which we have heard so much lately, our labourers have availed themselves of that boon without any strikes for many long years past. Our men, after reaching the homesteads, have perhaps to go to a distant field to work, the walk occupying some 15 to 30 minutes; the time allotted for meals and leaving off, except when at the homestead,

cannot be so rigidly enforced as in a manufactory; on thrashing days, and other busy occasions, there is the time devoted to "eleven o'clock" and "four o'clock." These deductions, coupled in the short days of winter, justify me in the statement that the farm labourer does not the year through work more than nine hours a day. Still, on some farms they carry the hours of harvest labour to an extreme. As to the apprehension lest the agricultural labourers should be over-educated, his own experience was to the contrary, as he had found that those men who had had the most educational advantages were the best labourers, and the most reasonable to deal with. Let the agricultural labourer be better educated, and the better dwelling must follow, for he would refuse to live in such hovels as his forefathers had been content to dwell in. He (Mr. Howard) hailed with much satisfaction the prospect of an improved education for the rising generation of labourers, and he hoped the farmers would do all they could to forward it by refusing to employ any boy under ten years of age. In a few years, then, at most, we should hope to see a great improvement in our agricultural labourer. He would be raised beyond the attractions of the beer-shops, now his greatest enemy; our model prisons would have fewer inmates; and paupers, instead of as now being the rule, would be the exception.

A long discussion followed, on the conclusion of which votes of thanks were accorded to Mr. Charles Howard, and to the President, Mr. James Howard, M.P.

LORD LEICESTER'S LEASE.

"I have found that in the lease in use on my estate there were many restrictions, such restrictions as I should not like to be bound by were I tenant of a farm. I have, therefore, with the assistance of my agent and my tenants, deviated from the beaten track, and endeavoured to frame a lease more in accordance with the spirit of the age, avoiding all interference with the capital of the tenant, removing all clauses that dictate as to the cropping of the soil, or as to the sale of the produce, and, as far as I can, giving him security for the capital invested. I have endeavoured to place my tenants in that position which I should like to hold as an occupier of land, and in doing so I am satisfied I have studied my own interest as well. That lease will be printed, and with as few legal phrases as is practicable; and I shall be happy to submit a copy of that lease to any of my friends who may like to see it, because I believe, with certain modifications, it may be adapted to many estates of this country, both for the advantage of the landlord and the tenant." So said Lord Leicester, at a dinner at Docking during the autumn, and we are now enabled to give the promised lease in full, as revised and agreed to by the landlord and a committee of his tenants. It may be as well to state in the outset that the committee consisted of Messrs. R. Leeds, H. Overman, W. Blyth, L. Taylor, and Betts; while, previous to its final adjustment, the lease was submitted to two general meetings of the Holkham tenantry. This document consequently comes before the country under unusually favourable auspices, as it is but fair to assume that the occupiers are equally answerable with the owner and his agent for the construction of the several clauses. Lord Leicester himself has objected to "many restrictions," nevertheless that which at the first blush of it will probably strike the reader, is the length to which the agreement runs, and the comparatively petty detail upon which it enters. The professed principle, however, of avoiding interference and retraining from dictation has in the main features been well observed. The tenant is to start with a twenty years' lease, during the first six-

teen years of which he is to cultivate and manage the farm according to his own judgment, and to have full power during such time to dispose of all or any portion of the produce of the farm by sale or otherwise. The Farmers' Club has just put upon its card as a subject for discussion during the year—"Freedom in Cultivation and Security of Capital;" and here we have certainly the most liberal interpretation of freedom of action that ever was offered. Of course the landlord protects himself towards the close of the tenancy by ensuring that the farm be left in such a condition as accords with the custom of the country; while he also reserves the far greater power of stepping in during the run of the lease, and insisting that the plough-lands shall be forthwith brought back to the four-course system. The natural effect of this will be that a man may farm as he pleases so long as he farms well; while he will be stopped so soon as he is found to be going wrong or too far. Of course there must be a great discretionary power here, and much will depend on the broad or narrow views taken by the landlord and his advisers. But there can be no mistake as to the wording of one portion of this clause—the tenant may dispose of all the produce "by sale or otherwise," or in any way he likes. Virtually we are inclined to regard this as the most important concession in the agreement, and as the "most in accordance with the spirit of the age." It is, indeed, wholesome to compare this open-handed arrangement with the fiddling, antiquated enactments in many so-called model and prize agreements, wherein you are bound not to sell hay, nor straw, nor roots, or if you take off a load of one or the other you must bring a load of good manure back in the place thereof—and so on. "What we want," said Mr. May, at a dinner at Stafford the other day, "is liberty of action in cropping and selling, so that a man does not deteriorate the land;" and these are the wants which Lord Leicester volunteers to supply.

The terms of in-coming and out-going are not marked by the same grand simplicity of style. Any system of compensation for unexhausted improvements seems, so

far as is possible, to be avoided, the tenant being left to right himself and get his own again during the last four years, should he not renew. There is something of a prolixity here, and more particularly in the citation of repairs, and how these are to be provided for, which considerably weakens the effect of the thing. A man who can be left to farm as he pleases, and sell what he pleases, might be surely entrusted to deal with habitable repair, and to clean "all his gutters, pipes, and troughs," and to "cherish, nail up, prune, and preserve" his fruit trees without the need of any instructions so to do in a twenty years' lease! If these clauses be petty and trifling, there are some still more decidedly objectionable, and it is difficult to understand how it is "in accordance with the spirit of the age" to bind a tenant down "to deliver one good fat turkey at Holkham House in the month of December in every year"—"to deliver so many waggon loads of good wheat straw at the Holkham stables," and "to do so many days' work of four horses," and so on. There is a smack of serfdom in the performance of such duties strangely at variance with the leading elements of the lease, if, in fact one part be not a direct contradiction to the other. How can a man who is at liberty in the first instance to dispose of *all* his produce by sale or otherwise be called upon to supply his landlord with so much good wheat straw? The tenant pays so much for the hire of the land, let the landlord in turn pay so much for the hire of the horses, let him buy the straw, and let there be no longer any such fine or heriot-holding as "one good fat turkey." This is all out of place in a lease drawn in accordance with a spirit of the times; as nothing has a worse tendency than payment in kind, whether this be in loaves of bread, measures of meal, trusses of straw, the hauling of coals, or crumming of turkeys. Again, there are few landlords in England, as we are inclined to think, who behave more liberally by their tenants in the matter of game than Lord Leicester, at least three-fourths of the shooting over the estates being let to the farmers at a low rent. And yet this kindly feeling is not so apparent in the lease. The tenant is certainly "to destroy all rabbits, moles, and rats," while the landlord reserves the exclusive right for himself, friends, and servants of hunting, shooting, fishing, fowling, and coursing. It is not so clear how the right of *hunting* can be reserved, and we have heard of Norfolk farmers who themselves have been at the head of stag-hound and harrier packs. Still, the tenants may kill hares with greyhounds, *but not otherwise*, between the first day of November and the first day of March, though this is no great boon, as not so remarkably in accordance with the spirit of the age, when many landlords are getting to give over the hares and rabbits to their tenants to dispose of, just as Lord Leicester does the other produce of the farm, in any way they choose.

The intention from the time it was first broached always struck us as a very admirable one, emanating as it did from just such a quarter as it should. Lord Leicester, moreover, has been able to preserve the main idea with which he started, although this is fettered and clogged with conditions, or perhaps more properly "set" in the mere verbiage of a solicitor's office. In truth we feel inclined to tell the committee the old story of the Sibly and her volumes, who when she had burned more than half of them asked as much money for the remainder, and only then was it that she found a customer. We should attach something of the same marketable value to this Holkham Lease.

[The following Lease has just been arranged by Lord Leicester and a Committee of the Holkham tenants.]

I. The tenancy is to be for twenty years, commencing on the eleventh day of October, one thousand eight hundred and

but to be terminable at the end of sixteen years at the request of the tenant, with the consent of the landlord; with the intention that the landlord shall then, if he think fit, grant a new lease from the end of the sixteenth year, at the old rent for the first four years of the new term, and for the remainder of the term at the rent that may then be agreed upon.

II.—The tenant is to reside in the farmhouse, and not to assign, underlet, or part with the farmhouse, or any part of the farm, without the previous consent in writing of the landlord or his agent.

III.—The rent is to be £ per annum, and is to become due and be payable by two equal half-yearly payments, namely, on the 6th April and 11th October in each year (except the last half-year's rent, which shall become due and be payable on the 2nd August next before the termination of the tenancy), clear of all present and future rates, taxes, and deductions whatever, except the tithe-rent charge, land tax, quit-rents, and landlord's property tax. The tenant is also to pay 45 per centum per annum on any sum or sums of money expended by the landlord in altering or erecting buildings at the request of tenant, after the works agreed to be done at the commencement of the tenancy are completed; he is also to pay 45 per centum per annum on any sum or sums of money expended by the landlord in draining. The payment for buildings is to commence from the 11th day of October next after the completion of the work, and the payment for draining from the 11th day of October next before the completion; and both the said annual sums shall become due, and continue payable as rent, during the remainder of the term, on the same days as the original rent is payable, and be subject to the same conditions.

IV. The tenant before entering upon the occupation of the farm is to pay to the landlord such a sum of money as the hay, turnips, mangold wurzel, and muck left upon the farm, and grown and made thereon during the then present year, shall be adjudged to be worth for consumption on the farm; the amount to be determined by arbitration, as hereinafter provided; and also the amounts that has been expended for grass seeds sown on the farm in the same year, and twopenne per acre for sowing the same. At the end of the tenancy the tenant is to leave in the hands of the landlord all the hay, turnips, and mangold wurzel, which shall be grown and produced on the farm in the last year, being paid for the same by arbitration.

V. The tenant is to find and provide, at proper and convenient times, before the 1st day of June next after entering upon the occupation of the farm (up to which time the barns or dressing houses are to remain in the occupation of the outgoing tenant), sufficient horses and waggons, or carts, with drivers, to convey the necessary fuel and water to the steam engine for thrashing the corn, grain, and pulse of the previous harvest; to remove the corn, grain, or pulse when thrashed into the dressing-house; to provide labourers to remove the straw as it passes from the thrashing machine; and to provide horses and drivers to remove the steam engine and thrashing apparatus after each thrashing, to any distance not exceeding seven miles from the farm. The tenant is to carry out and deliver, at proper and convenient times, before the said 1st day of June, in loads of not less than 25 coombs each, and not exceeding loads in any week, all such corn, grain, and pulse, to any place as may be required, within ten miles from the farm, and bring back the empty sacks; and he is to be allowed to take the straw, chaff and colder for his own use, and to be paid or allowed by the outgoing tenant the tolls and portage consequent upon carrying out the corn. At the end of the tenancy, the landlord is to make the same provision for thrashing and carrying out before the 1st day of June following, the corn, grain, and pulse grown on the farm in the last year of the tenancy, and to permit the tenant to retain possession of the barns or dressing-houses until that date.

VI.—The tenant is to cultivate and manage the farm during the first sixteen years of the term according to his own judgment, and to have full power during such time to dispose of all or any portion of the produce of the farm by sale or otherwise. During the last four years the tenant shall bring the arable lands into the four-course system of husbandry practised in Norfolk, so that in the last year of the term there shall be, as nearly as the sizes of the fields will admit, one-fourth in winter corn or pulse, upon olland or grass of one year's lying; one-fourth in a root crop, of which not more

than one-fourth shall be mangold wurzel, and not more than one-tenth in white turnips; one-fourth part in barley, or other spring corn; and the remaining fourth part in olland, or grass of one year's lying; and he is not to suffer any hemp, mustard, coleseed, nor any clover, trefoil, or other artificial grass, to stand or grow for a crop of seed in the last four years of the term.

VII. The tenant is effectually to destroy all rabbits, moles, and rats, upon every part of the farm. The tenant is to deliver waggon loads of good wheat-straw at the Holkham stables, or at any one of the landlord's brickyards as may be directed, in every year, without any allowance. The tenant is to deliver one good fat turkey at Holkham House in the month of December in every year. The tenant is to do days' work of four horses, with the necessary waggons or carts and drivers as may be required, to any place within the distance of ten miles from the farm in every year without allowance; and in case any portion of such day's work shall not have been done in any one year, the arrears of such year shall be performed in the subsequent year, if required or appointed by the landlord or his agent.

VIII. The tenant is not to remove nor alter any fences, landmarks or boundaries, nor to erect nor alter any buildings, without the consent in writing of the landlord or his agent. The tenant is not to break up, nor convert any of the meadow or old grass land into tillage, without the consent in writing of the landlord or his agent. The tenant is to pay a further annual rent of £20 for every acre, and the same rent in proportion for any greater or less quantity than an acre, which he shall break up and convert into tillage, in addition to any other rent of the farm; and such additional rent is to commence from the 11th day of October next preceding the breaking up of the land, to be payable half-yearly with the other rents of the farm, and to be subject to the same conditions. The tenant is also to pay a penalty of £5 for every timber or other tree which he shall cut down, crop, orlop, without the consent in writing of the landlord or his agent, in addition to the market value of the tree.

IX. The tenant is to give ten days' notice to the landlord of his sowing barley or spring corn in the last year of the tenancy, and the landlord is to have liberty to sow grass seeds on such lands, which the tenant is to harrow in without any allowance: the tenant is not to suffer any live stock, except swine well ringed, to be upon these lands from that time. The tenant is not to sow any swede turnips in the last year of the tenancy before the 16th day of May. The tenant is not to suffer the ollands or grass lands to be fed by any stock, except those of the landlord or his incoming tenant, after any sale of the tenant's stock and farming utensils in the last year of the tenancy, without first offering to sell the same to one of them by agreement or by arbitration. The tenant is to have all the crops upon the farm properly cleaned and weeded during the last two years of the tenancy; and the landlord is to have the power to do this work at the expense of the tenant, if it be not effectually done upon sufficient notice in writing from the landlord or his agent. The tenant is to stack all the crops of corn, grain, and pulse produced on the farm in the last year of the tenancy, in the fields where they are grown; or in an adjoining one if required by the landlord or his agent; and is to thrash out the same in a husbandlike manner before the 1st day of June following, leaving the straw, chaff, and colder without any allowance, so that the landlord or his incoming tenant may be regularly and constantly supplied.

X. The landlord reserves to himself the power at any time during the first sixteen years of the term, by notice in writing, to require that the arable lands shall be brought into the four-course system within four years from the date of such notice. The tenant, on receipt of such notice, or in the event of the death of the tenant, his executors or administrators without notice, shall bring the arable lands into the four-course system; and from such time he or they shall continue so to farm the lands; namely, the one-fourth part in winter-corn, upon olland or grass of one year's lying, shall immediately after such winter-corn be summer tilled, and sown with turnips or mangold wurzel, and then sown with barley or other spring corn, and laid down for one year with a sufficient quantity of good clover or grass seeds.

XI.—After such notice shall have been given, or on the decease of the tenant, or during the last four years of the term, the tenant, or his executors, or administrators, shall consume

on the farm all the hay, straw, chaff, colder, green crops, turnips, and mangold wurzel (except that grown in the last year of the tenancy), and spread the manure made thereon upon the lands where necessary, except in the last year, when one-third part thereof, as near as the same can be estimated, shall be left turned up in heaps for the use of the landlord. After such notice, or on the decease of the tenant, or during the last four years of the term, the tenant, his executors, or administrators, shall not mow more than a third of the meadow, or old grass land, and that only once in any year, and not two years in succession, nor at all in the last year; and he, or they, shall not mow more than two-thirds of the clover, or artificial grass, in the last year, nor any of the lands more than once; and such two-thirds shall be made into hay, and stacked and thatched upon a convenient part of the farm. After such notice, or on the decease of the tenant, or during the last four years, the tenant, his executors, or administrators, shall cut and scour, at proper seasons in every year, such fences and ditches as may require it, or as the landlord or his agent shall direct; shall defend and preserve all young thorn, quick fences and trees, from cattle and sheep; shall not pare nor remove the soil from the backs of the fences, but keep the banks well faced-up and backed-up, and not less than four-and-a-half feet wide at the base or foot thereof; and shall prevent the banks or fences of any wood or plantation, on or adjoining the farm, from being injured. He, or they, shall also cause all grips, water-courses, and drains belonging to the meadow or grass lands, including rivers on or adjoining the farm, to be opened, drawn, cleaned and bottomtyed, once in every year, at the proper season; shall keep the outfalls of all drains clear and free from obstruction; spread and level all ant-hills and mole-hills; mow all thistles, rushes and weeds, before their seeding time; and not suffer any swine, unless well ringed, to be upon any meadow or grass-land.

XII.—The tenant is to maintain, keep, and leave all the glass, windows, lines, weights, and fastenings thereto belonging; all locks, keys, bolts, bells, bell-wires, hinges, shelves, and fixtures of every kind to the farmhouse, offices and premises; water-closets with the cisterns and going gears; also all gates, gate-irons, stiles, posts, pales, rails, pumps, wells, bridges, tunnels, drains, grips, watercourses, river, river-banks, and other fences, upon and belonging to the farm or premises, in good and tenatable repair and condition, being allowed, or assigned on request, thorns grown upon the farm, bricks, pipes, lime and wood, for and towards such repairs. The tenant is to cause the woodwork and painted walls of the interior of the farmhouse and offices, to be painted with two coats of good oil paint, and the papered walls to be repapered, when considered necessary by the landlord or his agent, and to leave the same in a perfectly good and tenatable state, the paper to be of the same description and quality as at the commencement of the tenancy. The tenant is not to lay any corn, grain, wool, or other weighty or prejudicial matter in the farmhouse. The tenant is to make good at his own expense, both as to material and labour, all injuries to the farmhouse, buildings and premises, through the fault or neglect of himself, or his servants, or by the horses or cattle on the farm and premises, damage by fire excepted: and in the event of damage by fire not the wilful act or neglect of the tenant, the landlord shall sufficiently rebuild or restore the premises damaged or destroyed, within twelve calendar months.

XIII.—The tenant is to cause all gutters, pipes, and troughs, belonging to the farmhouse and other buildings, to be effectually cleaned out when necessary. The tenant is to provide and keep on the farm premises a ladder of sufficient length to reach to the roof of the highest building thereon, in a fit state for use, and to cause or permit the same to be used on all necessary occasions. The tenant is to keep and leave the garden, orchard, and shrubberies, well and sufficiently stocked, planted, manured, cleaned and preserved; and to well and sufficiently cherish, nail up, prune, and preserve all the fruit trees, bushes, vines and shrubs, standing or growing in the gardens, orchards, or shrubberies.

XVI.—The landlord is to maintain and keep the farmhouse and other buildings in good and tenatable repair during the term, excepting only such repairs as are before specified to be done by the tenant. The tenant is to fetch and carry all materials to be used in repairing the buildings, or in erecting new ones upon the farm by agreement during the term. The tenant is to fetch and carry all bricks, pipes, and tiles to

be used in draining upon the farm; and also a proportion of the materials to be used in repairing or erecting cottages belonging to the landlord, and situated in any village within one mile from the farm, with other tenants upon the estate; the proportion to be settled by the landlord or his agent.

XV. The landlord and his agent, and other persons authorised by him, are to have full power to enter upon the farm at all reasonable times, for the purpose of taking down and removing timber or other trees; carrying on draining or other works; inspecting, altering, and repairing the buildings; raising and removing marl, clay, brickearth, gravel, sand, or stone (which, with all timber trees, mines, and minerals, are reserved to the landlord); burning bricks, pipes, or tiles, or for any other lawful purpose, reimbursing the tenant for any injury he may sustain. The landlord retains the power to take land for roads, watercourses, building, plantings, or other improvements, or for the purpose of exchange, allowing to the tenant a proportionate reduction from the rent, and paying him for any actual damage he may sustain.

XVI. The landlord reserves the exclusive right, for himself, his friends, companions, and servants, of hunting, shooting, fishing, fowling, and (subject to the liberty of the tenant, between the 1st day of November and the 1st day of March in every year, to course the hares by means of greyhounds, but not otherwise) of coursing and sporting upon the farm and premises. The tenant is to use his utmost endeavours to preserve the fish, game, and eggs and nests of game, and to prevent all other persons from molesting or destroying the same, or for trespassing on any part of the lands for that purpose. The landlord may bring any action, or take any legal proceeding, or give any notices to or against any person so offending or trespassing, in the name and on behalf of the tenant, who shall not release, impeach, hinder, or discharge any such action or proceedings, without the consent in writing of the landlord, who shall indemnify and save the tenant harmless from the costs and charges.

XVII.—If the rents reserved, or any part of them, shall be in arrear or unpaid for twenty-one days after the date on which they are specified to be paid; or if the tenant shall break or infringe any of the conditions of his tenancy; or shall abscond, or cease to reside upon the farm; or be declared bankrupt; or make any assignment of his personal estate, or any composition with his creditors; or if any writ of execution shall be issued against his person or goods, the landlord shall have power to enter upon the farm, land, and premises, and remove the tenant, or any other persons therefrom, and the term shall thereupon cease; the right of distress, ejectment, or other action at law by the landlord not being in any way thereby affected. If at any time the crops

shall be sold under a distress for rent, they shall be sold subject to the straw, chaff, and colder being left on the farm without any allowance, and the hay and roots being consumed thereon. No receipt for any rent or penalty shall discharge any other rent or penalty than that mentioned in such receipt; and no condition before-mentioned shall operate to weaken, prejudice, or postpone the performance, of any other conditions by the tenant, nor the right of the landlord to enforce the same by action, suit, or otherwise.

XVIII.—In the event of the farm being given up to the landlord at any time during the first sixteen years, in consequence of the death of the tenant, or for any other reason with the consent of the landlord, the tenant shall be paid for any claying or marling done in the four years previous to such surrender, with the knowledge and sanction of the landlord or his agent, at the rate of three-fourths of the cost for that done in the previous year, one-half for that done in the third year, and one-fourth for any such work done in the fourth year before such surrender. In the event of the farm being so given up, by agreement made at any time subsequent to the 1st day of February in the year in which it is surrendered, the tenant shall also be paid one-third part of the cost price of linseed cake, consumed by stock (except horses) in well littered yards with troughed-sheds, or in boxes; or by sheep, when consuming turnips or mangold wurzel on the land, during the last year of the tenancy.

XIX.—When any valuation shall be made of the hay, turnips, mangold wurzel, and muck to be left at the end of the tenancy, the person or persons making such valuation shall take into consideration the state, condition, and usage of the farm and premises, and determine whether the tenant has carried out all the terms and conditions before-mentioned, and whether the farm is then in a clean and creditable state; and if not, shall determine what sum of money shall be paid to the landlord as compensation therefor, and shall deduct such sum from the amount which the hay, turnips, mangold wurzel, and muck shall be adjudged to be worth.

XX.—The word "landlord" shall include his heirs and assigns; and the word "tenant" shall include his executors, administrators, and assigns.

XXI.—If any question or dispute shall arise between the landlord and tenant, or their respective heirs, executors, administrators, or assigns, as to these terms and conditions, or any matter or thing connected with them, or with the occupation of the farm, such matter in difference, including any provided to be referred to arbitration, shall be referred to two arbitrators and their umpire, in accordance and conformity with the provisions contained in the Common Law Procedure Act (1854), or any then subsisting statutory modification thereof.

THE HEXHAM FARMERS' CLUB.

At the December meeting, held at the Club Room, Mr. C. G. GREY, president of the Club in the chair, said that at last meeting he made a few remarks respecting the progress made by the committee of the proposed Middle-Class School. He was glad to say that the farmers had exhibited an interest in it, and on the subscriptions lists he saw many names down for sums from £5 to £25 for starting this school. In the north of the county they had not yet opened a list, as they wanted clearly to understand the conditions on which these promises were made before putting down their names. He hoped that by next week subscription lists would be opened in various parts of the county, and then they would see what the middle class would do. If they came out with subscriptions of £5 and £10 all round the county, then they would show such a list that the large landowners would find it impossible to hold back from giving it their support, and they would get all the money required to carry out the scheme. The Endowed Schools Commissioners were favourable to it. The trustees had not yet taken up the matter, but he hoped they would show such a list that the large landowners would not find any difficulty with them. It was now for those who took an interest in it to take every opportunity of keeping the subject alive, and getting names down on the list for donations, for the Endowed Schools Commissioners and some of the large pro-

prietors had said they wanted to see what proof there was that the people of the county wanted a Middle-Class School, and the only way they could show they wanted it was by putting their names on the subscription list.

Mr. T. BELL (Hedley Hill, Gateshead) read the following paper on The Relative Interests of the Landlord, the Tenant, and the People in the Soil:—

The broad subject proposed for discussion is the interest of the people in the soil. The people we propose to divide into three classes. 1st. Landlords. 2nd. Tenants. 3rd. The people who are neither proprietors nor cultivators of the soil. It will be conceded that all live by the produce of the soil; consequently, to the extent of supplying the individual necessities of life, we are all mutually interested in its produce. So long as the soil produces sufficient to provide for these individual wants, every member of the human family has the right to have these wants supplied. If the term "landed interest" does not include the whole population, it must be limited to proprietors who own more than they need for their sustenance. If a man owns no more land than by his constant attention will procure a living for himself and family, he cannot be said to have any more interest in the produce of the soil than the man who labours and thereby procures his daily bread by another process than agri-

culture. If either party failed to labour, the food supply would fail; indeed the contingencies for a supply of the daily wants seem to be pretty evenly balanced; the labourer may fail to be supplied with labour, the peasant proprietor may lose the fruit of his labour through adverse seasons and cattle disease. We are having it often dinned into our ears by a certain class that "the working man is 'divorced' from the soil"—a most pernicious phrase. We have shown his intimate connection with it, through its produce. Starting on this premise, that all are interested in the soil to the extent of having food and raiment, it naturally follows that we are all deeply concerned whether the supplies of these products be scarce or abundant. Scarcity implies low rents to the landlord, empty pockets to the tenant, and dear food for everybody. It may, therefore, be safely assumed that the prosperity of any populous country will depend to a great extent on the products of its own soil. The country that imports these commodities must pay for them out of its own resources, and if able to produce them, must be impoverished unnecessarily to the extent that it imports. It must follow, that until a country has fully developed its agricultural resources, it has never attained to its highest possible position. Taking this, then, as the *summum bonum* of the nation, how can it be best brought about without interfering with vested interests? We may now proceed to consider the interests of the three classes separately. *The landlord's interest.*—To a landlord who lets his land, the main point of interest must be its capital value. The proprietor has been aptly compared to a banker who lends out his capital to a customer at its market value; the land representing the capital, the tenant the customer, and the rent the interest. To this capital value all landlords in legal possession have an undoubted right, morally and legally. So long as the rights of any sort of private property whatever are mutually upheld and respected, so long will the right of the landlord to the capital value of the land be established. I must confess here that I have failed to find any other interest in the soil to which the landlord can lay claim as an unalienable right, save this capital value, judging by precedent. Whatever portion of the soil can be proved to be absolutely required for certain public purposes—notably railways—the nation demands through Parliament that on payment of market value the owner must part with all interest in the portion required. The question not so easily settled is, for what public purposes may the nation demand a compulsory sale? Let us shortly glance at a few of the landlord's particular interests in the soil. 1st. *His patriotic interest.*—The ownership of land naturally gives to the proprietor the feeling of having a considerable interest in the welfare and prosperity of his country. Many of our old and noble families owe the possession of their estates to the prowess of their forefathers, who gained these estates either as a reward for gallant service in defence of king and country, or on condition that they would be ever ready when called upon to march at the head of a force they themselves should provide in the face of any enemy. This, as you all know, was part of the constitution of the old feudal system. It is unnecessary to say that the conditions under which these latter estates were held have vanished, leaving the descendants of these brave old warriors in possession, while they are only called upon to render such service as the State demands from all their fellow-countrymen. There can be no doubt that at this period of our country's history this sort of paternal relationship which existed between the classes under discussion is rapidly disappearing. It seems as if that particular class, who for ages past has been the peculiar care and under the paternal government of the rich and great, had now so far developed its own facilities that it is entertaining serious thoughts of commencing business, and trying to make its way in the world—seeking to make the most of the advantages and education it received while under the paternal care of its tutors and governors. I am not here to justify this state of things, but we will do well to keep the fact before us as we go along. 2nd. *The landlord's political interest in the soil.*—This interest is now feeling the effects of that altered relationship just referred to. The passing of the Ballot Bill by the House of Commons proves that this power is held by a very uncertain tenure, and also goes to show that some of the other conventional interests at present possessed by the landlords in the soil will only exist so long as the classes under discussion mutually agree as to their possession. 3rd. *The landlord's sporting interest.*—This interest cannot now be

classed amongst the undisputed privileges of a landed estate let out to tenantry. No landowner has the moral right to destroy the food of the nation without the consent of the people. It would easily be understood that were every landlord to convert his estate into a game preserve, the nation would have a perfect right to interfere. What landlord, then, can lay claim to the right if all cannot do it? It is clearly the province of the people to define what sporting rights shall exist, and not a question between landlord and tenant. The future existence of the Game-laws depends wholly on how the landlords exercise their present rights. Food can be imported, unfortunately, while animals to supply field sports to our wealthy citizens cannot be imported; consequently, the British farmer must compete with all the world in the production of food, even to the decimation of his own herds by disease so imported; yet he enjoys the entire monopoly of feeding the game of the British public. Yet, if game preserves and battues become general, and ground-game be persisted in, assuredly will the days of game certificates be shortened. 4th. *The landlord's monopoly.*—The immense estates and consequent disproportion in numbers between the landowners and the rest of the population of this country are considered by many people to be prejudicial to the interests of agriculture, and consequent welfare of the nation. There can be no doubt that the present land laws have a direct tendency to limit the number of proprietors. It does not, however, necessarily follow that large estates are under a worse state of cultivation than they would be if sub-divided. It is allowed that lack of capital is one of the great hindrances to the improvement of estates, but if the rent-roll of a large estate is not sufficient to leave a balance for permanent improvements, where is the probability of that balance being augmented when the number of proprietors' establishments are increased and limited to the same exchequer? It certainly places an immense power for either good or evil in the hands of one person; perhaps too much so. An alteration in the law of settlement or entail would do much to remove this power of evil over the country. We may endeavour to gather from this law something of the control the nation can and does exercise in the tenure of land. By mutual consent we have hitherto wisely guaranteed to the proprietors of land that the good things they sow in life their heirs shall reap; but we have not stopped with that, we have said to many of them—and surely very unwisely—your heir may sow nothing but to the wind, if he chooses, yet we guarantee to his heir, not the whirlwind, but the whole of this good thing, your landed estate. And although spendthrift may succeed spendthrift, we guarantee each succeeding heir possession in tact, if they so desire it, together with every improvement effected by the tenants or other parties on said lands. This is surely a premium paid by the nation to improvidence on the part of these landowners, and ruin in many cases of their dependents. It may be perfectly right that the fruit of a man's good works should be carefully transmitted to his children, yet it is surely wrong in society to take on its own shoulders a larger proportion of the fruit of his evil deeds, and let his own heir go nearly scot free. The present law for distraint for rent is one of the effects of this monopoly. What is known as the Law of Hypothec in Scotland, has of late years been the subject of much discussion and inquiry. The Scotch law gives the landlord a much greater claim over the effects of a bankrupt tenant. In certain instances it empowers him to lay claim to the produce of the land after it has left the farm and been bought and paid for by other parties. So long as there was a difficulty in finding capital in the country, this law might be advantageous. But now, when capital is everywhere seeking profitable employment, there can be no excuse for protecting the interests of one class at the expense of another. We need not enter on the laws relative to the transfer of land; they are generally allowed by all classes to be much in need of reducing and simplifying. *The tenant's interest.*—Assuming that the tenant is the customer of the landlord for his capital the land, and the yearly rent the interest paid for such capital, this places us on the purely business relationship which exists between the two parties. Unfortunately this too often explains the whole relationship—it is a matter of money getting. Although the mercantile aspect of the contract should be always definitely kept in view, yet the landlord and tenant ought to have a mutual interest in each other on account of the great interest they each have in the present and future treatment of the soil. It is only where this mutual interest exists that the highest fertility and

greatest productiveness will be found. The tenant-farmer's annual interest in the cultivated soil of Great Britain is much larger than the landlord's annual interest. We may suppose the average rent of arable land to be about 30s. per acre, but look over a highly cultivated farm about midsummer, and consider the interest of the tenant bound up in the soil at that time. It will be found to be from five to ten times greater than the money value of the landlord's annual interest. Indeed the products now raised cannot be said to be the natural produce of the soil. The old system of farming might be compared to a manufacturer with a natural water power capable of enabling him to set up a certain power of machinery, and produce a limited quantity of goods. The modern system might be likened to the same factory having added to its natural water power an additional imported power, multiplying almost indefinitely its capabilities of production. It seems to me that it is this additional power brought to bear upon agriculture by the farmer, that needs the special attention of the nation. Is it desirable that it should be developed and extended? If so, what means would be likely to produce this effect? I would suggest, give the tenant security for his interest in the soil. The interest of the tenant in the soil is at present such that he would not be justified under any but the most favourable and exceptionable circumstance in maintaining the maximum fertility of the soil. Take a farm of 400 acres at a rent of 30s. per acre, fair market value, entered upon by an intelligent, practical farmer. It will be above the average of farms if it is not capable of improvement. What Dr. Chalmers has aptly described "The margin of Cultivation," will not yield a rent if cultivated. It will not produce enough to pay its way. But by putting on additional capital much of the land outside this margin would pay the interest on such capital, yield a rent, leave a profit to the tenant, and a good produce to the nation. Suppose 100 acres of this farm to be lying in poor grass, wet, and valued at 7s. 6d. per acre. Suppose the proprietor judiciously expends £1,000 in draining, fencing, clearing, &c., this at 5 per cent. increases the rent to 17s. 6d. per acre. The production of this additional rent oftentimes requires considerable enterprise and energy on the part of the tenant. Such land left to nature would really be worth little more for the draining for a few years, as a considerable amount of the grasses natural to wet land would die out, and not until the lapse of some years, would the finer grasses fill the vacancies. The calculating tenant would say, "This land would pay for cultivation, but it would take a stiff outlay to do it justice. I am not sure of much return for the first few years, but it has a good subsoil, and I am sure it would pay eventually, but who knows whether either I or mine would reap the benefit of this outlay? I could perfectly trust my landlord and his agent. I am sure they would do me justice, but they are mortal. So a king may arise that knows not Joseph, and I may be turned out after I have put all this land into good condition. I certainly have an agreement for a proportion of the lime being repaid, and so much for cake, bones, &c., for the last year or so, and some other items, but that would be a poor return for all my outlay, labour, and anxiety. Why, I am sure in ten years I could make that land worth 27s. 6d. per acre; it is now dear at 17s. 6d. My cultivation would, therefore, increase its value 10s. per acre, which, on 100 acres, is £50 per annum I somebody will receive as the result of my attention. £50 per annum capitalised is worth to me £1,000. If I had to leave I probably would not get £100." If the tenant acts on commercial principles he would here say, "There is here no security for investment, I must put no more in than I can take out." The consequence is the land may never be worth more than 17s. 6d. per acre. The simple want of security here, is permanent loss to all three classes. Suppose the tenant goes to work trusting to the future; improves his farm; and at the end of ten years he has raised the annual value £100 per annum real value (making due allowance for any change in the value of money), which sum capitalised amounts to £2,000. Owing to some combination of circumstances the tenant must quit. Now arises the all-important question, whose shall be the £2,000? The law would say, "the landlord's of course"! Justice would ask who made it? and equity would reply "the tenant." It

will be said here, a lease under ordinary circumstances gives a farmer security that he will be repaid any judicious investments. But we may fairly ask, does farming pay such a large percentage on capital, that the farmer can afford to give up a large proportion of its produce? Assuredly not? Yet that that is what is yearly going on is apparent to every observant eye. If a tenant during his lease has increased the real value of his farm, at the end of the lease he finds he has improved against himself; he is placed on the horns of a dilemma, for he must either buy over again what his own capital has produced, or part with it to another without payment. According to the present law, the tenant-farmer's interest in the soil is not equal to the miller's interest in the corn that it produces, or the manufacturer's in that of its fleecy flocks. They are sure of obtaining their raw material at market value, and no matter how they invest their capital for producing food and clothing for the people, they can always command the market value for that capital. Not so with the producer of corn and wool. He may invest his capital to increase the production of food and wool, but what he invests in the soil has no market value to him. What he brings out he gets market value for, what he leaves he has no market for, therefore, he is not justified in putting more in than he can take out. The tenantry of Great Britain may be fairly allowed to ask the question—Why do you grant a Tenant-Right to Irish farmers, and leave us out in the cold? This Irish story may help to illustrate the case: An Irish gentleman was residing with a friend, and on a certain day a number of visitors arrived to stay over night: there was a difficulty about accommodation. The good lady of the house said to her resident friend, "We'll have to do our best to make these strangers comfortable, so you, dear old friend, will just take the bed in the garret." "Shure and it's a mighty quare way you have of showing your friendship," said the friend, "Better be a stranger than a friend here." Granted that the Irish tenantry needed a Tenant-Right a little more, it cannot be said they deserved it better. Mr. Gladstone's definition of an unexhausted improvement was happy, and the correct one: "whatever increases the lettable value." No details or scales of lime, bone, cakes, &c., used, will ever do an enterprising, energetic tenant justice. They take no account of how a man used his brains in their application. If farmers participated in the permanent improvement of the soil they create, it would give such an impetus to agriculture in England as would surprise the most sanguine. Capital would flow into the soil from the tenantry, when they knew security was given that they should have their share of what it produced. Landlords would have their estates improved with that capital, and participate in the increased value. The landlord's interest must increase with the tenant's improvements; therefore a definite proportion only of the permanent increase of value must be allotted to the tenant. The labour market would be greatly benefited. The produce of the soil would be immensely augmented. Importation of food would be proportionately lessened. Capital that must have left the country as payment of that importation will be left for trade purposes. In short, it is capable of demonstration that it would be greatly to the benefit of all classes of society to bestow on the tenantry of Great Britain that interest in the soil which justice demands and an equitable Tenant-Right would bestow. *The People's Interest.*—In point of numbers, the owners and tenants of the soil are only "like the small dust in the balance" compared with the mass of people who hold no direct communication with agriculture. John Stuart Mill has represented the owners of the agricultural surface of England as numbering about 30,000. Mr. Disraeli calculates the tenant-farmers at somewhere about 800,000. These numbers with their families and dependants, deducted from the census returns of England, leave about twenty millions as the number composing class third. Although this may not be a correct computation, it may fairly serve to show the vast proportion of our population who are not directly interested in agriculture, yet, indirectly, are so deeply interested in its welfare, and now hold the power to wield a considerable influence over its future destiny. Let us consider if a direct agricultural interest in the soil is attainable by the masses? It is generally assumed that the possession of a direct interest in the soil by a much larger proportion of the population would be a great advantage

to the nation. Such may be the case, but it may be argued, only under certain given conditions. Given a community like the Jews, at that period of their history when they first crossed the Jordan to enter upon their possession of the land of Canaan, and with all the accumulated wisdom of the intervening centuries, I question much if the sages of the nineteenth century could frame a code of land laws better adapted to promote the well-being of the people, or tend more to develop the resources of the country. Yet it will be readily granted that they are ill-adapted to meet the requirements of this our land; even were it possible to apply them, which, for obvious reasons, is simply impossible. Where the resources of a country are nearly or wholly limited to its soil, if that soil is capable of producing supplies sufficient to meet the wants of its inhabitants, it is clear the more equally the agricultural surface is apportioned the greater will be the individual chances of happiness to the community. Great Britain is understood to be unable to produce food for its teeming population; at any rate it is quite certain, were its soil equally distributed at once amongst its inhabitants, and they were confined to what they produced, misery and starvation would be greatly multiplied amongst us. Fortunately other resources are vast, if not abundant, and this fact implies a proportion of the population devoting their energies to the development of these other resources. Whenever such pursuits hold forth greater pecuniary or imaginary advantages than agriculture to an individual, if circumstances permit, he leaves his rural abode, and probably goes to swell still further some of our rising towns. So long as commerce and manufactures continue to offer and supply these increased advantages, society shares in the improvement. Unfortunately the tides of commerce and trade have their ebb and flow. So long as they continue to flow all is well, but when the ebb comes then is the fiery ordeal experienced by a thickly populated country, and more especially by that portion who have felt the slow but moderately sure pursuits of agriculture for the "glorious uncertainties" of trade and commerce. This tendency to leave agriculture and join the hives of industry is thought by many people to be a source of great evil to us as a nation. We believe we are pointed to the Swiss and French peasant proprietors with their small holdings as models of thrift, industry, and comfort. So far as I can make out, it is not that the provinces of Switzerland and France offer greater returns to the agriculturists than the soil of England, but because manufactures and commerce do not there offer sufficient inducements to cause the peasantry to leave the soil and enter their ranks. It would not be difficult to show that in any country where manufactures and trade flourish, and where there is free trade in food supplies, that land must inevitably fall into the hands of the wealthy, and those who make it their business to add field to field. Banish the love of money from the hearts of men, and things might be different. Suppose a man to be the owner of fifty acres, worth a rent of £75 per annum; suppose him to be further possessed of additional capital to cultivate it, he would, according to the Government mode of calculating a farmer's profits, add £32 10s. to his income by devoting his time and attention to the farming of his own land. A capitalist makes him an offer for his freehold at the rate of thirty years' purchase, which, with the stock in trade, would realise somewhere about £2,700. An investment turns up for the money, offering five per cent. with good security. Here is a much larger income offered, with the additional value of whatever his time and talents might realise devoted to other pursuits. Trade or commerce might possibly hold out to him a prospect of 10 or 20 or even 30 per cent. for his capital. No man who aspires after an increase of income would be content with little over £100 a-year from his land, when its capital value dangles constantly before him an income of, it may be, several hundreds. This may account for the sad fact that the sturdy yeomanry of England are gradually disappearing. The calculating, intelligent, small freeholder sells his land, the indolent and dissipated squander it. Under present circumstances the possession of the soil of England to any extent by small freeholders, is, to say the least, highly improbable. A tenant right such as we have proposed, would have a powerful tendency to increase the number of tenant-farmers in England. It is too much the custom of the tenantry of the present day to spread their capital over the greatest number of acres they can possibly stretch it, and they are consequently obliged to allow nature to be their principal agent. The experience of farmers

urges them in this direction. They find that the men who best develop the resources of the soil do not always make most money, and the reason is not far to seek. Such men permanently improve their holdings with a large outlay, and nothing but the value of a permanent interest in such improvements will adequately repay them. It will be seen at a glance that if compensation were secured to the improving tenant, improvements would rapidly multiply, and, instead of capital being spread over two many acres as it is now, it would be concentrated on what is capable of improvement. Lands capable of improvement might be profitably let out into small holdings, and rented by men of limited capital—labour being the heavy item in reclaiming land. If such small farmers could live from the produce of their holdings, the improvements they effected would become capital, and the soil would act as a sort of savings bank, where they could safely deposit the fruits of their labours. Therefore, to give a greater proportion of the community a direct interest in the cultivation of the soil, the laws affecting agriculture will require to be framed in accordance with strictly commercial principles. Let us now consider the desirability of increasing the agricultural population. It will be generally allowed that the greater the number of the population that will devote their capital and labour to the soil the better for the country so long as that appropriation does not interfere with the development of other more profitable resources. Whatever amount of capital is spent on labour to improve the natural condition of the soil is a clear gain to the labour market, and a consequent distribution of capital among the labouring classes. Demand causes a limit to other productions, and they generally require another capital to create that demand. The produce of the soil in this country can never exceed the demand, neither does it need the intervention or capital to buy it. The result is, the more the resources of the soil are developed, the better will be the condition of the labouring classes, and, consequently, the healthier will be the state of trade. The subject might be viewed, under other aspects than those bearing upon the pecuniary interest this third class hold in the soil. The social surroundings of town and city life amongst the lower stratum of society more especially, are generally considered to have a degenerating effect both morally and physically. They sharpen the wits and the intellect at the expense oftentimes of both soul and body. On the other hand, it is also allowed that nothing tends so much to the formation of habits of thrift and industry, and also healthy organizations as pastoral and agricultural employment, especially if the parties concerned have a direct interest in the produce of their labour. We have seen that the tendency of the present age is to crowd still further our already overcrowded towns. What seems to me to be wanting in our constitution is some means of retaining our agricultural population, and also of conveying back to the healthy moral and physical influences of the country those who have so far failed to maintain these qualities that they are no longer able to fight the battle of life without assistance either given or taken from their fellow-townsmen. Acting on the proverb that "Prevention is better than cure," let us see what means can be devised to retain and increase our agricultural population. We have seen how remote is the prospect of any large proportion of the soil being possessed by small proprietors. We have shown how the numbers of the tenantry may be advantageously added. We may now consider the position of the agricultural labourers. The late Parliamentary inquiry into their condition goes to show that in the North of England they command higher wages, are stronger physically and intellectually, and consequently, hold a better position in society than almost, if not in any, other part of the kingdom. May this not be accounted for by the fact that in this said district are located the chief seats of the coal and iron trade, which furnish a species of employment to which the agricultural labourer can readily turn his hand. The consequence is, agriculture must offer similar returns to its operatives as trade, otherwise they cannot be retained. In these districts in the South of England, where their condition is reported to be so wretched, it argues a similar state of things existing amongst the surrounding workmen, otherwise a sad lack of intelligence and observation on their part. In proceeding to discuss this part of the question, the celebrated case of capital *versus* labour, which has excited so much attention of late, comes prominently before everyone of us. This case presented some strange aspects. There came an outcry from many quarters that

labourers for the ingathering of the harvest were very much needed, and were the reverse of plentiful. At the same time the streets of our famous market town were thronged with thousands of idle men. These men and their families were supported by the labour of their own class working in other parts of the country. The interests of agriculture, of every branch of industry, and of every class of society, appeared to be valueless in their estimation, their sole aim being the advancement of their own class interest. Now, whether this class was right or wrong is not the question. What we ought carefully to observe is the fact that one class of men placed themselves in direct antagonism to the interests of their employers, even at the risk of permanently damaging the trade of the neighbourhood, and solely, as they allege, because their interests were neglected by their employers. Now, gentlemen, I am sure we all with one voice can say, May the day never come when the landowners and farmers shall find themselves in this position with the peasantry of England. We must, therefore, not disguise from ourselves the fact that the interests of the landowner, the farmer, and the peasant have not been pursuing the course of parallel lines. These three interests were much nearer the point of contact at the beginning of the century than at the present time, and seem to go on gradually diverging. This in itself is a sufficient cause for uneasiness. We have proposed a method of uniting the interest of the landlord and farmer in the soil. Is there no way of uniting the interests of the farmer and his labourers? An indispensable requisite to this union of interest is sufficient cottage accommodation on the farm, containing provision for their inmates enjoying the comforts and observing the decencies of cottage rural life; vegetable gardens attached are here implied. Many estates are notoriously deficient in this respect. A commission of inquiry to report on the state of cottage accommodation for our farm labourers, taking account of both quantity and quality, might furnish an interesting document. I very much fear a report on the necessary horse accommodation would compare very favourably with it in some quarters. Granting the dwellings up to the requisite standard, we still have to face the difficulty that they have no direct interest in the farmer's success. The day may not be distant that to retain labourers with sufficient intellectual ability and in adequate numbers to carry on the agriculture of this country, the present state of affairs, described as "capital *versus* labour," will require to be modified, and the amended term, "capital *et* labour," used to express the relationship. We may inquire if any plan can be devised to bring back to the healthy influence of agricultural labour that portion of society who, though able-bodied, seem either unable or unwilling to earn an honest livelihood. The proportions that pauperism is now assuming are truly alarming. The annual return on the 1st of January, 1870, shows their number in England at that date to be upwards of one million. And what adds to the alarm and surprise is the fact that nearly one-half of them were composed of able-bodied men and women and their families. When the growing independence of the working classes is spoken of, think of 300,000 children belonging to able-bodied men and women growing up paupers! Think of these children being reared in such an atmosphere—taught that a life of indolence and dependence is preferable to industry and self-respect! Let us take two facts and place them side by side. Thousands of acres of uncultivated land in England, capable of profitable cultivation, and 200,000 men and women and their families, able to work, yet professing to be out of sufficiently remunerative employment to keep body and soul together. The question is—Can there be no way devised to bring together these two material substances that seem naturally made for each other? Intimately connected with this part of the subject is the question of waste lands and how to deal with them. It is pretty confidently affirmed by many profound thinkers that in the enclosure and appropriation of common lands that have been going on these last 50 years a larger proportion of the poor of the several districts have been robbed of their inheritance. It looks, to say the least, suspicious that three or four thousand acres should be parcelled out amongst existing proprietors, and perhaps two acres allotted to the poor. At the same time the enclosure of commons and making them real property, either individual or corporate, is an undoubted benefit to the country. My experience in connection with an extensive unenclosed common led me to the conclusion that commons are one of the best nurseries for producing a thrift-

less, indolent, dishonest population—the most certain way of keeping land in its primitive condition, or of having its cultivated portions thoroughly impoverished. Some of that land which before the enclosure was not worth a rent of 5s. per acre has since been let for £3 per acre, and hills and valleys that were literally deserts have been converted into fruitful fields. Where they are conveniently situated, might not land and institutions be provided where destitute persons might be able to earn money, and where vagrants would find that food, lodgings, and clothing could be had for working, but under no other conditions? The town of Hexham seems to have at present a peculiarly favourable opportunity for trying an experiment on a small scale. I see from the papers it is proposed to provide a scheme for disposing of Tyne Green for some public purpose for the advantage of the inhabitants of the town of Hexham. Now, what could be more to the advantage or credit of the inhabitants than their Local Board providing employment on Tyne Green for the destitute able-bodied poor, thereby giving those a chance who were willing to earn an honest wage, and would assuredly keep the town rid of those notorious scoundrels known as professional vagrants? The probability is that the scheme would be found self-supporting; if so, it would cause a sensible diminution in the rates. The North-Eastern Reformatory at Netherton, near Morpeth, affords a striking example of how productive employment may be found on poor land for one class of society that needs to be taken in charge by the nation, viz., juvenile criminals. I had the privilege not long ago of being shown over the institution and the farms worked by it, and take this opportunity of bearing testimony to the excellence of the scheme, and also the practical manner in which its details are worked out by the resident manager, Mr. Anderson. There 150 lads may be seen, drawn from the very scum of society, learning what in their class may be called the art of honest, productive labour. A large proportion of them wear the hue of health on their cheeks, and show well developed muscles, affording a striking contrast to the pallid cheeks and flabby appearance of the corresponding class to be seen in our workhouses. The institution commenced with 40 acres of land, but a short experience warranted the committee in making considerable extensions, and two years ago they further enlarged their borders, and now farm 486 acres. It is no libel on a certain portion of this recently acquired land, now in process of being broken up, to say that for agricultural purposes it is in its present condition valueless. No manipulation will make it produce a crop that will repay cultivation until the infusion of some powerful fertilising agency. The annual application of about £200 worth of town manure which the farm receives, in addition to the quantity made upon the farm by the extended system of feeding (38 head of cattle were at the time of our visit upon full feed, turnips, cake, and meal), together with the trenching and system of spade husbandry carried out, is rapidly changing the whole aspect of the place. The farm accounts for the last year show a balance in favour of the institution. About 71 per cent. of the lads discharged are known to be doing well, which fact affords the best proof of the practical benefit the institution confers upon society. It is devoutly to be wished that the Reformatory at Netherton will prove the pioneer of many similar institutions. There the problem has been solved how to provide honest productive labour on the soil for a class who would never either seek or find it anywhere but under compulsion. Society would rid itself of a great burden by extending this provision to other classes whose liberty of action has furnished proof that they mean to live by preying on their fellow creatures. It is not beyond the bounds of probability that schemes will be hereafter carried out on a very extensive scale for the cultivation of unreclaimed lands by public companies, who, with Parliamentary powers and Government aid, will buy up such lands, build, plant, and cultivate, not solely for aggrandisement, but from commercial and philanthropic motives combined, composed of persons who will endeavour to make it impossible for any one to say in their hearing or district that they cannot find employment. It will be observed that I have confined my remarks principally to the agricultural interests of the people in the soil. Though I may have exhausted your patience, I feel I have very far from exhausted the subject. I would just add that there is a spirit of inquiry abroad, and a sifting of authorities and instructions that will certainly produce important results, it may be ere many years elapse. There is a

growing feeling of independence exhibiting itself amongst the more thoughtful portions of all classes of the community. This feeling is fostered by the present prosperous state of trade throughout the country. It will be well for England if some of the disturbing elements abroad in society could be amicably settled during this period of prosperity. Although it is perfectly true that individual effort is the only way of securing the blessings available to humanity, and that no human agency can ever permanently benefit any person or class that won't help themselves, yet these truths furnish no excuse for continuing any system that has been tried in the fire of experience and found wanting. The laws of nature framed by unerring wisdom furnish the best precedent for the regulation of human laws. Nature's laws have decreed that every unit of humanity is dependent on the products of the soil for the means of existence. It may be safely inferred from this one fact that no portion of the community can assume to constitute itself the sole and unquestionable custodian of that channel through which flows the bountiful provision the Almighty is continually supplying wherewith to bless mankind.

The CHAIRMAN said that the paper was a very comprehensive one, and embraced such a wide field that it was a very difficult thing to take it up and criticise it at that moment. Different points would, no doubt, strike different members, and if each person would give his observations, they might be able to gather together a certain amount of collected wisdom more than they could expect from one individual. There were a great many points in it—if they could be retained in one's memory—that he would be anxious to make observations upon; in some of them he fully agreed with Mr. Bell, in some he was a little doubtful, and in others he altogether differed from him. He would be glad, however, first to hear what any of the members of the club had to say upon any points that struck them.

Mr. JOHN HOPE, jun., said he was considerably interested in the question that had been brought before them. Mr. Bell had placed before them the land question in some of the very important relationships in regard to the three great classes—the landlord, the tenant, and the consumer, or the people. In many things he held advanced notions, yet he had not the slightest sympathy with anything that savoured of revolution or disorder; he simply went in for that which was dictated by good sound common sense and with a due regard to the interests of all parties, never forgetting that most important section of the people—the British public. Adam Smith laid it down as one of his first axioms that land stood first as a means of investment for capital; and reasonably so, because they had to work up to certain fixed laws—they were not dependent upon the fraud or deceit of mankind—they were not dependent upon the fraud or deceit of mankind—they were tolerably safe in that respect, for the agriculturist stood in a much firmer position than the manufacturer or the merchant, and, with certain percentages, he was tolerably free from bad debts. Mr. Bell brought before them the landlord's interest, and he might say that his own opinion was that no man who had property had a right to use it to the disadvantage and to the loss of the community at large. Property was not given for mere personal pleasure; it was a stewardship of which they would have to give an account, and such property might be made highly productive and a source of real value to the nation. It was, however, impossible for landlord and tenant to work together unless there were wise laws governing both, and it was essentially necessary that there should be good laws regulating the relationships between landlord and tenant; and it was also to the interest of the third class—the people—to see that there were such laws, in order that the tenant might be encouraged to grow the largest possible crops, and also to enable the landlord to preserve his land in a good state of fertility, and to protect him from bad tenants. He believed that this country could produce almost as much food as would feed the present population, provided there were none wasted, and they made every acre of land produce its full portion. If they kept its producing power down below par, as a matter of course they would have poverty, because instead of producing it at home they had to send away for the raw material, with all the freight and labour added to it into the bargain. Speaking of the relations between landlord, tenant, and people, Mr. Bell gave them an instance where the wealthy classes forgot their poorer relations. He referred to the distribution of common lands, in which such a small quantity went

to the poorer class. Small farms well cultivated he held to be better for the nation than large farms not fully cultivated. If they wished to rear a sturdy peasantry they should give them an interest in the soil—some condition of profit. As the time of the club was precious he would simply say that he cordially agreed with almost the entire portion of Mr. Bell's paper, which he considered sound, useful, and practical, and one likely to do good.

Mr. GRAY said that there were many interests connected with agriculture, but the three leading interests were those of landlord, tenant, and labourer. He had given the paper his best attention, and he felt a little disappointed with the way in which Mr. Bell had spoken of the labouring class. It was well enough to give them an interest in common lands and in the cultivation of the soil, but they were aware that the working class had received an increase of wages and were shortening the hours of labour, and the subject of farm labourers' hours might have been a little more entered into. He quite agreed with Mr. Bell that if they could only banish the love of money out of the hearts of men all would be well. But whatsoever they wished men to do to them they should do to others. While they complained of landlords not granting them the privileges they ought to have, he did not see that they always granted the labouring classes the privileges they ought to have. They ought to do something for the labouring class, although much had already been done for them in the way of better cottages and so forth. In reference to the hours of labour, they found that all other labourers were getting shorter hours and half-holidays and other privileges which farm labourers did not enjoy. He did not go in for half-holidays for farm labourers, as he did not see the necessity for them as there was in large towns and in manufacturing districts, because their labourers breathed the fresh air every day. He thought, however, that it was hard for a man to be constantly confined to his work from six o'clock in the morning till six o'clock at night, and he suggested that they should have some portion of time in which the labourer, his wife, and family might attend to domestic duties and their own private concerns. He might say that Mr. Lee, of Dilston, had been in the habit of giving his men two hours on the Saturday afternoon, and they heard of Mr. Stephenson, of Throckley, giving his labourers a half-holiday every alternate week. He thought, that in a social point of view the farm labourer ought to have two hours on Saturday afternoon, and he considered he had a right to it. In many cases the labourer's wife had to work out of the doors, and perhaps they had a family, in which case the elder children had to take care of the younger ones, and on Saturday night they found they had a great many things to do which they could not find time to do in order to prepare for Sunday. He knew of many cases in which the man had to make the marketing, while his wife had to attend to other duties almost up to midnight. They were bound to look at this matter in a religious light if they expected them to attend a place of worship on the Sunday, and they believed that Sunday-schools were becoming more and more needed in this country, and were more and more becoming a religious institution, and, in his opinion, the farm labourer had a right to a certain amount of time on Saturday afternoons, in order to prepare for Sunday worship and to enable him to send his children to the Sunday-school. In many cases there were excuses of this kind given with reference to the absence of children from the school on a Sunday morning. The wife said there were so many little things to do, stockings to darn and clothes to mend, and people did not wish their children to go to the Sunday-school unless they were decent and tidy. They heard some farmers say they could not afford it, because they had to pay such a high rent for their land. The reply to that objection was that it was not a question of affording—every man could afford to do what was right. Another class said they would not use it right. That was not the question; if it was right for them to have it, it was right for them to give it whether they used it right or not. He thought of bringing a motion before the meeting to the effect that a committee be formed to consider and discuss the whole subject of landlord, tenant, and labourer. Perhaps that was too comprehensive?

Mr. ANDREW WOOD: Not a bit.

Mr. GRAY said he would move that a committee be appointed by this Club to discuss the whole subject, and try to bring about or lay some basis down by which all things might be

arranged, and the united welfare of all these classes—landlord, tenant, and labourer—be increased.

Mr. ANDREW WOOD seconded Mr. Gray's motion that a committee be appointed, or another meeting be convened to discuss Mr. Bell's paper, which was so exhaustive and contained so many points worthy of careful attention, that they could not sufficiently notice them at that time, but if they had the paper printed and before them, he had no doubt but that they could discuss it much better. It was, indeed, a first-rate paper, but there was one point he wished to draw their attention to. A great deal had been said about work, and about making work for labourers by enclosing commons and such as that, and putting vagrants to work on Tyne Green. But they would have to supply the will to the tramps, and give them the will to labour, as well as the chance of labour. At present they could hardly get men on the roads to break stones, notwithstanding all the sturdy tramps that were going about. There must be some law to compel men to work.

The CHAIRMAN: If they will not work, neither should they eat.

Mr. WOOD: That is the simplest way to deal with them. They should not let all their attention be directed to the labourer; the tenant, the improving tenant, he wished to point out, had often to pay for his improvements when he took a second lease, while the tenant who had not improved got the farm at the old rent. That was a point which ought to be well considered by the Club.

Mr. JOS. LEE said thanks were due to Mr. Bell for his excellent paper, and remarked that there were some points in it with which he could not agree, neither with what Mr. Wood had said. He had known several cases where landlords had seen where the tenants were improving their property and had acted honourably and granted them liberal leases, and they must not condemn them as a class in that respect, although in many cases they did not act so liberally. Certainly, he considered the owners of the land had a monopoly in that land; the tenants had no control over them. Take, for instance, their own county. Suppose they wanted a farm, and went to a landlord and said, "We wish to take a farm free from all destruction of hares and rabbits," for they might let the other game alone if they got rid of the hares and rabbits. For nine-tenths of the land in the country the agents would say to them, "You must take the farm upon these terms," including the game, and they had only Hobson's choice. They could not say that the tenants were to blame. It was said that under an Act of Parliament, considered to be a liberal Act, all the game was given to the tenant; but the consequence was that the makers of the law avoided that law, and made it a condition when the tenant took the farm that he was to let the game go back to them again. The makers of the law in that case avoided the law. In many cases farmers had shamefully abused the privileges given to them when leaving farms. He had seen where a farmer had farmed for thirty years, and when he was done with the farm he would in the last two or three years run the land down so that it might be the least possible value for re-letting. He had seen tenants at the end of a lease run the land down so as to be in such a state as to lessen its value in re-letting. It would be well if laws were invented to avoid these cases—both the advantage which the landlords take, and the advantage which tenants take. If they looked at the three classes, he considered that the labourers had done their duty better than the other two classes. Mr. Gray had referred to him allowing his men and women to go off work at four o'clock on Saturday afternoon, which he had done for some years, and with no disadvantage to himself, and he thought with great benefit to the labourers. He had several things jotted down, but time was spending, and if they agreed to meet another day to continue the discussion they might be entered into at that time.

Mr. JOHN RIDLEY proposed a vote of thanks to Mr. Bell for his able paper, and expressed his surprise that no tenant-farmer had taken up what he considered to be the most important part of Mr. Bell's paper, namely, the subject of tenant-right. It was in his opinion the most important question that had come before that Club. With respect to the rights of the labourers, he thought that good cottages, good education, and a fair day's work for a fair day's wage was the best right they could have.

Mr. TROTTER (Secretary) said he should have been glad if the Chairman had stated his objections against those parts of

the paper which did not meet his views, as they would then have had something to battle against. His own opinion of Mr. Bell's paper was that it was good in principle throughout, and with respect to the tenant-right part of it they would have that discussed at the annual meeting. He was glad to be able to give his full weight—however much or little that might be—to the principle, and he thought that Mr. Lee's arguments went to strengthen Mr. Bell's case very materially.

Mr. LEE said he pointed out the necessity for some laws being enacted, so that neither landlord nor tenant could take any undue advantage of each other.

Mr. TROTTER thought that Mr. Lee's arguments proved the correctness of Mr. Bell's views. They had, however, rather got from the subject of the paper, and all the speakers had alluded to subjects very much beyond the question, which more particularly had reference to the improvement and progress of agriculture. The laws which regulated the business transactions between landlord and tenant were unfair, and therefore, unjust. If a tenant got into difficulties and was unable to meet his creditors, all the creditors must stand aside and be content with perhaps a farthing in the pound, or it might be nothing, while the landlord received twenty shillings in the pound. That was not the only black view of the case, for if it was known that a tenant was in a little shortened circumstance, and there was some probability of his stock being pounced upon by his landlord, he could not let his turnips so well as in affluent circumstances, because the stock feeding upon these turnips were liable to be seized. It must appear at once unjust and unfair for a man's stock to be seized to pay another man's rent. Suppose he was in rather straitened circumstances, he let Mr. Lee twenty acres of turnips, and before three months were over he got into difficulty, Mr. Lee's stock would be pounced upon and sold to pay his rent for that year. That would be unfair to the rest of his creditors as well as unfair to Mr. Lee. If it was thought proper to postpone the discussion he should be very glad, but so far as the tenant-right part of it was concerned there was a fair prospect of that being ably introduced and ably discussed at the annual meeting. He had great pleasure in joining Mr. Lee and Mr. Ridley in moving a vote of thanks to Mr. Bell for his able paper.

The CHAIRMAN said that Mr. Trotter had found fault with the speakers wandering from the subject of the paper, but he thought that all the observations of the speakers rose out of one part or other of Mr. Bell's paper, except those of Mr. Trotter, which were upon the law of landlord and tenant, which was not included in the paper, which was upon the interests of the landlord, the tenant, and the people in the soil. He should not attempt to make any observations upon the paper that day, but if the members wished to have another meeting after having the paper put into their hands in print he was sure they would spend another day with profit in discussing it.

The vote of thanks to Mr. Bell having been unanimously carried, Mr. BELL returned thanks.

It was then resolved to adjourn the discussion till Tuesday, January 2nd.

At the adjourned meeting for the purpose of resuming the discussion,

The CHAIRMAN, Mr. C. G. Grey, said that without thoroughly going into Mr. Bell's paper he would allude to one or two points in it, and perhaps that might excite some little debate amongst the members of the club. He jotted down one or two things as the paper was read, but if he had read the paper closely probably he would have found one or two more things to talk about. The first thing which he noted down was that a country which did not grow sufficient agricultural produce for its own consumption necessarily had to import food, and the importing of food and paying for it impoverished the country. He differed from that—on a question of economy—altogether. Set apart an island, purely agricultural, say the Isle of Man; if that island could not grow enough to support its own inhabitants, and had to pay money to import food, it would be a most ruinous speculation, and decidedly contrary to all proper notions of political economy. Take another island of the same size, cover it with iron furnaces and manufactories; they would import food and export goods, and that country could afford to import ten times the quantity of food it could consume. It would lose nothing by importing its food, and it did not follow that importing food was a ruinous proceeding. The more this

country increased in mineral productions and manufactured articles, not only of iron, but articles such as cotton and wool, the raw material of which was got from other countries, the more they increased the population on account of these manufactures, and they could more afford to pay for the food from other countries, and there was less necessity to support the population on the food grown at home. He did not say that was any argument that they should not grow as much as they could to support the population; what he meant to say was that this country went on prospering in its manufactures and commerce, and if all the land that was wasted, as some people said, in parks, deer forests, and so on, was brought into a high state of cultivation, he much doubted that they would have sufficient food, and they would still have to import, owing to this country being to such an extent a manufacturing country. They admitted that they must import food, and they had to compete with other countries that grew food cheaper, and the question was for them to consider how they could grow the largest quantity of food on the land they had by such appliances as would pay them for doing so. They might go to Allendale Common, and by expense grow turnips and even corn there, but he did not think it would pay. They must study the climate and altitude of land, and apply the assistance they got from chemistry and other sciences to their climate, and so on, to discover what they could grow in every separate place with the greatest advantage to the country, not forgetting the profit to their own pockets—a matter which no doubt they would always remember. He should go gently indeed over the game question, as it was one that always raised a great controversy, and he would not have alluded to it, but Mr. Bell said it was not a question between landlord and tenant. He thought it was essentially a question between landlord and tenant, although the law in regard to it might be altered with advantage. He had stated his opinion upon this question over and over again. The game by the law was the property of the person who had the farm, and if he voluntarily gave up his right to it it was his own fault. It was entirely a matter between landlord and tenant, but how there could be any question of its being the property of the public he could not see. Suppose he went to a person in the neighbourhood who had a farm to let, and said he would farm it for him for £500 a year, and made a bargain to have the game; he grew as much as he could, for he took the farm and the game from the landlord, and he would see that it would pay him, there being a demand from the great manufacturing people: they wanted rabbits and hares, and gave tremendous prices for them, and these men who got their wages by the nine hours' movement liked to have coursing and live rabbits. He might make a good deal of money from the game, and was entitled to have it as much protected as his sheep. Ought idle men to be allowed to take them from him? They had no more right to take his game than they had to steal his geese or turkeys. Some people advocated that hares and rabbits were not the property of the land on which they grew. He would make game property, and he would have a man taken up for taking a hare out of his field just as he would be for stealing his ducks. That was his view of the question. The question of land being a monopoly had been touched upon, that the tendency was to diminish the number of proprietors, and connected with that remark was the law of entail, and by the law of entail the nation took upon its shoulders the evil deeds of the son of the entailer of the property. He thought there were a great many evils connected with entailing estates, but he thought when they carried out their theory of a nation taking the responsibility of a spendthrift son, it was exactly the same as a person who had accumulated wealth in manufactures, in railways, or any other enterprise, and who had a spendthrift son and a blackguard. The old man saw his son would spend all his money and leave his children paupers, and he determined not to allow that, and settled his money on prudent neighbours as trustees, and said to them allow this young fellow so much a year as long as he lives, and at his death divide the money amongst his children. If a man had a right to do that in one kind of investment he had a right to do it in all. All that he claimed was equality. If a man was able to tie up much consols and so many railway shares in the hands of trustees, then a man ought to be able to tie up land in the hands of trustees, so that his son would not be able to spend it and leave his grand-children paupers. He would, however,

make such measures as would ensure these trustees the power of managing their property as landed property should be managed. They ought not to say to a man that he must leave his property to a spendthrift son who would leave his grand-children paupers. He admitted that the tendency was to diminish the number of proprietors. If a man chose to invest all his money in North-Eastern railway shares, had they a right to make a law, and tell that man he had got too great an interest in the company and compel him to sell out shares and invest the money elsewhere? If a farm was put up for sale, they had no right to say to the Duke of Northumberland that he must not put in for this farm because he had got enough land already. If they had a right to say that he had got enough land already to any person, were they not injuring the man who had the land for sale? Had any one a right to go to a farmer's wife selling butter and eggs, and say to a rich person, "You live in a big house, you can afford to go elsewhere, you shall not buy this woman's butter"? He had been a free-trader all his life, and was so still, but it would not be free trade if they put any prohibition upon land if any one had a farm to sell. The tendency was to buy up small proprietors, because from the earliest days of the history of England, persons had always considered it to be a privilege and an advantage to be landed proprietors. So long as it was so, and so long as that privilege was not held to be an exclusive privilege which other people did not enjoy, it was simply the free will of the people that they would rather be landed proprietors than proprietors of any other kind of goods. If a man chose to invest his money at 2½ or 3 per cent. in land, or 3½ or 4 per cent. in funds, or 8 to 10 per cent. in railways, or 20 per cent. in trade, he had a right to do so, and they had only to guard against giving the landed proprietor any privilege over the owners of other kinds of property. He had heard of small proprietors selling their estates and doing better as tenant farmers, and had even heard of a man thriving and paying rent on the farm which he had sold and could not live on when he had no rent to pay. It was a tendency of the age to diminish the number of proprietors. A person having a small property worth £400 or £500 a-year, instead of spending his life in cultivating it, could get 30 or 35 years' purchase, and by selling out and going and speculating in ships and trade he could double or perhaps quadruple his income. And why should he not, if he could quadruple his income by investing his money in trade, for what good would this little farm do to him, as he would have to leave it to his eldest son, and the rest of his children would have to make their way as best they could? For many years past these small proprietors had been disappearing from the face of the country, they sold their land to large proprietors, and he had no doubt but that these men were doing better by investing their small capital in a more remunerative way than in land. He did not know but what these people were the gainers by it, and also that the country would be gainers by it. As to the law of transfer, he agreed that it ought to be as simple as the transfer of railway shares or anything else. He thought that a man ought to be able to sell his field or his farm without going to title deeds and running up a lawyer's bill, which did no good to anybody. As to the tenant's interest, he did not make full enough notes on that to go fully into it. It was a question whether the tenant's interest in land was more than simply a mercantile bargain between him and his landlord. If they said it was not, the landlord would say that he would farm his own land and not let it at all. If that was done generally it would altogether alter the position of the country. That it could be done he had no doubt; it could be done very well, a landlord could manage his own land, though it might be a large undertaking on a large property. A landlord could manage to farm all his own land; he could find good men to act as stewards and managers, pay them fixed salaries and also percentages on profits. That was a system he had tried himself and found to answer well. These men would be paid 5 or 10 per cent. on the profits, taking stock once a year. If landlords chose to do away altogether with the class of tenant-farmers it would entirely revolutionize the country. Who would say that these men had not a right to do that? The farms being let to tenants was simply an expedient, as it was far less trouble to the landlord to take so much a year and let the tenant make as much as he could out of it. This principle was applied in other ways; they farmed out tolls and a great many things of that kind; a fixed sum was paid

and the man could make as much as he could out of it. If it was purely a mercantile transaction, the letting of farms, it was merely the making of a bargain, and that they would make the best of the bargain he had no doubt, if there was not too great a demand for farms. Tenants had it always in their power to make a fair bargain with their landlords; good tenants, at any rate, always had, bad tenants might not have that power. If they admitted it was a matter of contract and bargain, the tenant made his own terms, and he made them for so many years. He was bound by the landlord not to do certain things which a landlord thought would damage his property, as he had a right to have it back in as good a state as it was in at the beginning. If he got it back better than it was before—and that was a question Mr. Bell took up—whose was the increase? He would ask another question, if a man took a farm at £300 a-year, and gave it up worth only £250 a-year, whose was the loss? One question should answer the other. He had known farms given up at the end of a lease worse than they were at the beginning of it, and what remedy had the landlord? He had to seek a tenant, and only get £250 a-year for his farm, and on Mr. Bell's principle it was never again to be more than £250, so that landlord's properties could diminish, but never improve. He did not believe in that at all; that was not his idea at all. He had himself taken a farm of over 700 acres during the minority of a young man, and he had it only for 13 years. He began to pull down a lot of useless fences, and he spent some money in draining beyond what was allowed in the case of money borrowed from Government for draining purposes. He had to cart the artificial manures up a hill to the farm, but he got good crops of turnips which he ate off with sheep, and splendid crops of seed, and got good grass land where there was bad before. Some of his neighbours said to him, "You are spending a great deal of money on this place. It will improve the land very much." He said that was just what he intended to do. They said, "But you have only got 13 years of it." He said he did not care for that if he only got his money back. They said, "The landlord will get better land back." He said he did not care a fig for that as long as he made a good deal of money. In the last few years he made £600 or £700 a-year on capital of £2,000 or £3,000, but if he had only spent £500, and not got £100 profit, which would have been the best investment? His neighbours advised him not to spend his money for fear of benefiting his landlord at the end of his lease, but then he did not care for that if he did himself a benefit. If they got a farm for 21 years they could calculate how it would pay. Some people were afraid to do good to anybody else except themselves, but in any kind of trade if they were doing good to themselves they were doing good to somebody else generally. In taking a farm it was the tenant's own speculation how much money he made during the lease, and if he improved the farm during the lease had no one else but the tenant to benefit by it? If a farm increased £50 in value, Mr. Bell's notion was that the tenant who was leaving should get this £50, the new tenant who took the farm would have to pay the full value and the landlord would only get his old rent. They would give the landlord an annuity, so much a year off the estate, he would not spend a penny in buildings, he was secured, he had a fixed rent, and the man who got it increased in value got this for ever. This tenant, say, made the farm worth £800 a year, when his grandson got it he gave up farming and sub-let it to another, and thus they got a class of middlemen, and it was these middlemen that grind the tenants under them till they had not got a coat on their backs. It was much better for the country—he had seen both sides of the question—for tenants to take these farms for a certain period of time directly from the landlord. If the tenant was not tied to it he would not sub-let, but he would go away and take his capital and invest it in other business if he chose. The best system of letting farms was not to tie a tenant down for ever to a place, but to allow him to leave the farm after a certain period and invest his capital in any other business to his own advantage as he thought best. He did not say that there could be no improvement made in the condition of letting farms; he would like to see a system devised over the whole country to avoid litigation by putting down in one universal code what was the custom of the country, &c. The late Mr. Pusey, one of the pioneers in agricultural improvement in this country, tried to make such a scheme, and intro-

duced a Bill into Parliament with that view, but he met with a good deal of opposition to it, and never to this day had it been carried out. He thought they would all agree that a good deal ought to be done, and as far as possible for what the tenant really did leave in the land he ought to be paid for it. In Lincolnshire they had a regular system of tenant-right. It was supposed that a certain quantity of manures would last so many years in the land, and if a tenant had not occupied the land that number of years so much was due to him from the next tenant. Here they had the same thing in the away-going crop. A certain quantity of the land was allowed to be cropped, and the tenant after he had left his farm came back and took his crops, supposed to be the produce of what he had put into the farm. That was on the same principle, and he would extend that principle where it could be fairly shown that the tenant had not reaped the benefit of what he had put into the land. From what he had said they would infer that he entirely disagreed with Mr. Bell that tenants were not justified in high cultivation. He said they were, and it would pay better to cultivate high than to cultivate low. Then, as to the people's interest in the land, that was a very wide question. Mr. Bell in his paper quoted from Mr. John Stuart Mill to show that there were only 30,000 landowners in the country. Mr. John Stuart Mill used those figures for a different purpose than Mr. Bell did, and made a great handle of them. But it was entirely untrue; the figures were taken from the census returns, but these returns only gave what a man's principal occupation was. Many tenant-farmers were also landowners; he returned himself as a land agent, but he was also a landowner, and many gentlemen in Newcastle—lawyers, tobacconists, and others—were landowners, and many of them had considerable property. Instead of 30,000 he thought there were more like 300,000 people who would own land in this country. There could be no question that the people had an interest in the land, and that interest was shown by Parliament asserting its right to take land for the public welfare. It could compel the sale of land for railway purposes and for sanitary measures and several other things. No doubt that right of the public—represented by Parliament as he presumed it was—might be extended considerably in any place where it was shown that it was for the public welfare. The country, represented by its Parliament, had the right to interfere, and take that land by paying the full value for it, and the proprietor must invest his money elsewhere. Whether the interest of the public extended beyond that, admitted of a great deal of argument—whether the public had a right to say to a man who chose to lay out his land in parks and ornamental grounds that it was not producing as much food as it might do for the country, and insist on it being put into tillage. It was a grave question whether the people's interest went so far, and it was a question whether a man had not a right to lay out so much of his land for his pleasure and amusement as a man had to spend so much money in other pleasures and amusements. If the people for their food were entirely dependent upon this country, and if sufficient food could not be procured without turning every gentleman's park and every poor man's little flower garden into wheat fields, then Parliament had a right to say the people must have food, and take from them their parks and flower gardens, and grow wheat upon them; but until that time arrived, he did not see that Parliament, as the representative of the public, had that right. If Parliament had that right it would have to be carried out to its full extent. If they took the gentleman's park from him for the good of the country, they would have to go to the tenant-farmer and say that he was not cultivating his land as well and growing as much produce as he ought to do, and they would also have to go to the poor man and take away his half chain of land on which he was growing flowers for the flower shows. What was sauce for the goose was sauce for the gander. That was his idea of free trade; if they laid down theories they would have to carry them out to the fullest extent. Something was said about the enclosure of commons. A common was a piece of unenclosed land, surrounded by land acquired by purchase, or by descent, or by encroachment, which was from time immemorial, and thus became a matter of right, or by murder if they liked (as suggested by Mr. Trotter); but time had confirmed the title of commoners on the owners of adjoining property, and time, and a long time indeed, had confirmed the right of commonage of these people

on that land. It was theirs; the common belonged to certain proprietors, and if anyone ventured to put 1,000 sheep on that common, had the commoners not a right to say, "This is ours; you have no business to put your sheep on it at all." The commoners had as much right to common as a man had to his freehold house and garden. He admitted the claim of the country to say through Parliament that certain things were necessary. Cities were too crowded, and therefore Parliament granted powers to take the land adjoining for a public park, but they could only take it from him on paying him the full value for it. If 1,000 acres of Allendale Common were needed to keep the people of Northumberland in health, he would say by all means take Parliamentary powers to take it for public recreation. He differed altogether from people who said that these commons belonged to the public. It would come to this—the public had a right to walk over their farms, with guns, of course, and dogs, and go where they liked. He maintained that his wheat and turnip fields ought to be as much protected as the manufactory or the mill—[Mr. TROTTER: The foxhounds?]—The foxhounds have no right to go over the farmers' fields; it was merely a matter of good feeling. Most people thought it good sport, and kept it up in the country, but if people said they would not allow it they had a perfect right to keep the foxhounds off their land. He had given them his idea in respect to commons, and closed his observations on Mr. Bell's paper. Mr. Hope, in his speech, referred to the interests of the great British public; it was a grand-sounding expression, the great British public, but meant simply people who had mouths to fill and backs to put coats on. If an owner was "Steward to the great British public"—he presumed Mr. Hope meant an owner of land—he would agree with that gentleman if he would extend the expression so as to include owners of all property, and that all property was held for the good of mankind, but not land more than grass seeds, cheese, or anything else. Mr. Hope made a successful remark about produce, and importing manures from abroad; it was a question he always brought before the club whenever he could. They spent a great deal of money in importing manures, and allowed to go into their rivers to destroy the fish and poison the atmosphere as much manure as would manure the whole country. He thought if they insisted upon their representatives in Parliament devoting their time to useful legislation, such as the pollution of rivers, the waste of sewage, and the waste of all kinds of manures at home, and sending money away for foreign manures, and looking better after these interests, it would be better than fighting at elections to send a man to make speeches about the great British public, and wasting half the time with high-down speeches about the politics which Mr. G. O. Trevelyan, the Hon. Anberon Herbert, and Sir Charles Dilke went spouting about. It was all very well to discuss politics in theory, and see how far they could extend them, but in the meantime their pockets were suffering from oppressive local taxation, the pollution of the rivers required looking after, and many other things, and nothing more than the sanitary conditions of towns and villages; yet the people were dying from typhoid and other fevers, the produce of farms and towns was going to waste, and they allowed their members of Parliament to make themselves conspicuous in the land by making speeches about politics which would not do them nor their children the least good. There was an allusion made in *Punch* to the nine hours' movement: a workman who had got the nine hours returned home and began to grumble about this and a hundred other things. The man's wife replied it was very well for him to grumble who had got the nine hours, but she had worked fifteen hours, and had to go on working while he sat by the fireside grumbling. He did not see but that the poor man's wife ought to have the nine hours too. Mr. Wood made the remark that the tenant who did not improve got his farm again at the same rent. His way was to let a farm for twenty-one years, and if he saw there was room for improvement, and there was no improvement made, he would let it to some one else at the same rent, but not to the same person. If a farm was not capable of improvement by fair farming, it was quite fair to let the tenant have it at the same rent, and he did not see why he should not get it at the same rent if he farmed fairly and properly.

Mr. TROTTER said that the subject of tenant's right had been brought prominently out, and it might be as well to follow

out the Chairman's remarks upon it. He held with Mr. Bell that the tenant was fully entitled to the improvement made upon his farm. Suppose a small farm was let at an even rent of £100, it was quite possible that a good tenant might, in the course of ten years, increase its value fifty per cent., by increasing its value £5 every year. The question naturally arose, to whom belonged that £50? Was it a question that he who sowed should reap? or was it a question that the landlord should reap all the improvement of the farm which had not cost him the strain of a single muscle or a single thought? and, what was more, that £50 a-year in all probability represented all that the tenant had made during the time? If he sold his stock and crop at the end of ten years he would very likely find himself no better man than he was at the beginning of his lease.

The CHAIRMAN: He's been spending his money very badly.

Mr. TROTTER said many men were losing money by farming. One gentleman near Newcastle improved his land till he became a bankrupt in three or four years, and another tenant who had come after him was making a fortune of it.

The CHAIRMAN: It was a bad speculation; the man had invested his money foolishly.

Mr. TROTTER thought that a tenant who improved the value of his farm to the extent of £50 a-year was entitled to receive £1,000. It was said where was the landlord to get £1,000? let him borrow.

The CHAIRMAN: What security of getting it afterwards?

Mr. TROTTER: He could borrow at four per cent., which left him a margin of £10 a-year. Ten per cent. he called a fair increase in the value of property in ten years. It was asked if the land decreased in value how was the landlord to be paid? At the end of the ten years, as the law stood at present, the landlord could come at the tenant for dilapidation of fences and buildings in that way. He held that it was a landlord's own blame if his property went backward; he was induced to take the offer of the tenant who bid the highest rent, for if the tenant failed he had the first chance of all his stock and crop. He always regarded this as one inducement which caused tenants to give more rent for farms than they could possibly make out of the land legitimately. Then with respect to the law of entail, which seemed to have the Chairman's approval, he admitted that where a gentleman had a spendthrift son, and was in possession of entailed estates, he was awkwardly placed. But he might have a second son, a steady, industrious young man, yet he was bound by the law of entail—a very cruel law—to leave all that property to his first-born, although he might be a squanderer and a spendthrift.

The CHAIRMAN said Mr. Trotter made a mistake. It was a common mistake that an estate went by the law of entail to the eldest son from generation to generation. A man who had an estate could settle it upon his son's son, that he should inherit it, but he could not settle it beyond that. If his son and grandson chose they could break the entail. It was a mistaken notion that they were forced to entail from father to son.

Mr. LEE: If it was entailed upon the eldest it could not go to the second son.

Mr. TROTTER: If a gentleman came into the possession of an entailed estate, it went to the eldest son, he could not leave it to his second son. It was a hard thing if a man came into possession of an entailed estate he could not leave his sons equal portions of it; the first-born came into possession of thousands of pounds and the others might go a-begging.

The CHAIRMAN said a father might leave to a son £10,000 in railway shares in the same way. It might seem hard, but it was the fault of the father and not of the law.

Mr. TROTTER held that the law was really bad, and it was no use them meeting to discuss these subjects if their object was not to endeavour to get faulty laws rectified. Laws ought to proceed from justice, and not justice the offshoot of law. If property was left to a gentleman and entailed to be left to the eldest son throughout no one could leave it otherwise until the entail was broken.

The CHAIRMAN said that any of them could break the entail. A father left an entailed estate to his son, and that man and his eldest son could break the entail, or it was broken at the son's death. The person could not entail it unless his eldest son joined him.

Mr. BELL remarked that the owner of the property could refuse to allow his son an income after he had attained his majority until he agreed to re-settle it upon his eldest son, and so the thing was perpetuated in that way.

The CHAIRMAN said it was done by individuals, and not by the law.

Mr. TROTTER: Suppose a man is in possession of an entailed estate, and he was a fast man, could his creditors seize upon the estate and sell it? If not, it was not in accordance with justice, and the sooner it was rectified the better.

Mr. JOS. LEE said that the law of primogeniture was bad, and, therefore, unjust, and ought to be done away with. It was very unfair when a man died without a will that all his property should go to his eldest son. It would also be very beneficial if they could get the same Act passed for England and Scotland as was passed in regard to the encumbered estates in Ireland. There were a great many estates in this country and in Scotland very much hampered, having annuities to pay out of them and so much borrowed capital, and until there was a chance of making these estates free there was not much chance of getting them improved. On many estates land only realised 3 per cent., and very likely these people had money borrowed for which they were paying 4 or 4½ per cent. Then as to the question between tenant and landlord, a prudent tenant was always prevented from building anything permanent upon his landlord's property. Suppose he wanted to build a cottage for a faithful servant to prevent him travelling miles to his work, immediately the cottage was built it belonged to the landlord.

The CHAIRMAN: The landlord ought to build it.

Mr. LEE knew different landlords who said that they were too poor and could not afford to do it, and their agents stated that when the interest on borrowed money and annuities was paid out of the income of the estate there was hardly anything to live upon. They might perhaps build one of wood and be able to remove it. Certainly it would be a privilege to build one in bricks and be able to take the bricks away on leaving the farm, but perhaps Parliament might devise something better than that. Tenants ought to have sufficient compensation for unexhausted improvements, but before anything was paid for these all dilapidations should be valued, and he would have these deducted off the value of the unexhausted improvements before he gave anything to the tenant, because so far as he had seen in this country there were as many bad farmers as bad landlords.

Mr. ROBB said if the question had been one respecting the management of farms which they were discussing he would not have made any observations upon it, as he had no practical knowledge of it, but he was so much interested in the question itself and in the discussion which took place at the previous meeting he could not resist the temptation of speaking upon it, especially upon one of the leading topics of Mr. Bell's paper. He congratulated Mr. Bell upon the excellence of that paper, both in its thought and mode of expression, and he also congratulated the Chairman for his lucid address upon the subject as seen from his point of view. He wished to keep the attention of the club upon the leading principle of Mr. Bell's paper—the Tenant-Right and compensation to tenants for past improvements. This was purely commercial, and as such a tradesman could understand it as well as either a tenant farmer or a landlord. Take Mr. Trotter's illustration: a tenant took a farm at £100 a-year. That was the value of it at the time he entered upon his lease—suppose for 21 years—and at the end of the lease the farm was worth £150 a-year. £50 a-year capitalised in the way Mr. Trotter put it was £1,000, and Mr. Trotter was for giving it altogether to the tenant. He dissented from that—

Mr. TROTTER: £50 put into the value of property at 30 years purchase represented £1,500.

Mr. ROBB: Take it at £1,500 if you will, and—

Mr. TROTTER: The landlord gets £500 of it.

Mr. ROBB said its mode of distribution was the present question. It would be unjust to give the whole of the amount to the tenant, and it would be equally unjust to allow the landlord to absorb all these improvements. Surely there might be a middle course; justice and right might be met in something like this way; let an estimate be made by properly appointed parties, perhaps it might be done by a court of arbitration, composed of people connected with the neighbourhood, who should say what the farmer had expended in improvements, and allowing for skill and general ability in making these improvements; and also apportioning to the landlord that uncertain but yet definite amount which his property might have risen in value with the times, and which could not be denied. A general improvement had taken place

over the country, represented all over the country as the improvement of the times, and that was a matter entirely beyond the interference of the tenant-farmer, and in some measure beyond that of the owner himself. Since he had his capital in the land he was entitled to some measure of the improvement in the general prosperity of the country; it would be difficult to estimate, but any such court as he had spoken of, composed of equal parts from each of the two classes, might come to a fair decision upon the matter. Take another illustration, a landlord spent £500 upon draining a farm, and charged 5 per cent., that is, £25 a-year. If that land was worth draining the increase in the produce would be worth more than the 5 per cent., it might be 10 or 15 per cent. if the land be as grateful as much of the land in this district had been after draining. Who was entitled to this increase? Doubtless it would fall to the tenant-farmer, but was not the landlord entitled in this case to more than his usual charge of 5 per cent.? There existed a good many incommensurable quantities, as mathematicians called them, in these matters, and caution and prudence had been shown in a high degree in Mr. Bell's paper. Mr. Trotter had bolder views on the subject. Regarding the tenure of land itself dangerous points had been touched upon, but he was glad to hear from the Chairman that he looked upon owners of property in the light of stewards, but how far their stewardship went, for how long it was given, and how they could interfere with it in any way or modify it, or finally abolish it, it was not for him to say. He quite agreed with the Chairman that much of the time of Parliament was spent in stupid abstract talk about impossible legislation, while many practical and local matters were compelled to lie over. Mr. Robb referred to the recent speeches of Sir C. Dilke and the Hon. Anson Herbert, and remarked that anything like Republican revolution or confiscation of property was not to be tolerated or thought of for a moment in this land in which justice and right had held sway for many ages, and he did not fear but that justice and right would continue to be the principle upon which Englishmen would continue to treat the property of one another.

Mr. CHRISTOPHER GREY thought that still the subject had not been half gone into, and moved that a committee be appointed to take the whole subject into consideration, so that steps might be taken to come to some practical conclusion. It was no use grumbling and finding fault with one another, for their prosperity was bound up in the united prosperity of landlord, tenant, and labourer, and he wished them to come to some conclusion having for its object their united welfare. He thought that the legislators of this country did not give a fair amount of attention to the agricultural interest. He liked the suggestion as to having courts of arbitration, and he thought they would be highly beneficial in matters of this kind. He did not see why they should not have something of the kind as well as other interests in this and other countries. The great nations of the earth—those which were most advanced in every respect—were trying to settle their differences by arbitration, and he thought that landlords, tenants, and labourers should try to do the same thing. He moved the appointment of a committee to discuss the whole subject, and to petition Parliament to pass laws to provide them with a proper means of settling all differences.

Mr. C. MARSHALL suggested that the discussion should be again adjourned, as the afternoon was far advanced, so as to give Mr. Bell an opportunity of replying.

The CHAIRMAN said it was a wide question, and it would be better if each subject was discussed separately, so that they could come to a resolution on each separate subject, but they could not come to any resolution to take in the whole of this question. However, if there were more members who wanted to speak upon this subject it would be better to adjourn the discussion to that day fortnight.

Mr. C. MARSHALL moved the adjournment of the discussion till the 16th inst., which was seconded by Mr. T. Dryden, and carried.

Mr. BELL said his sole object in bringing this subject before their notice, which he knew was a ticklish one, and would throw himself open to unfavourable remarks, was to bring the land question seriously before the attention of the Club, believing that Parliament would be obliged to legislate upon that question, and at no distant day, and he wished the agricultural interest to have its mind made up before that time, so as to be able to speak out distinctly and definitely and make known what they did want.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

At the January monthly meeting of the directors there were present: Sir James Gardiner Baird of Saughton Hall, Bart.; Sir Thomas Buchan Hepburn of Smeaton, Bart.; Dr. Balfour, Mr. Binnie, Seton Mains: Mr. Graham Binny, W.S., Mr. Leslie Melville Cartwright, Melville House; Mr. Hew Crichton, S.S.C., Mr. Curror, The Lee; Mr. Dudgeon of Cargen, Mr. Ford, Hardengreen; Mr. Hog, of Newliston; Mr. Lawson, of Bothwick Hall; Mr. Kenneth Mackenzie, C.A.; Mr. Mitchell, Alloa; Mr. Murray, of Dollerie; Mr. Mylne, Niddry Mains; Mr. Scott Skirving, Camptoun; Captain Tod, of Howden, Mr. Trotter, Champdeuric; Mr. Young, of Cleish—Mr. Mylne in the chair.

The following letter from the Veterinary Department of the Privy Council Office was read:—

Princes-street, Westminster, 21st December, 1871.

Sir,—I have submitted to the Lords of the Council your letter of the 8th instant, transmitting excerpt from the minutes of a special committee of the Highland and Agricultural Society of Scotland on the transit of animals. Referring to the minutes above alluded to, I am directed to state that any specific case of evasion of the provisions of the Transit of Animals Order of May 1870, if reported to this office, will receive the attention of the Privy Council. With reference to the first provision proposed by the committee, I have to inform you that no means which the Privy Council would feel justified in enforcing have been suggested to their Lordships for the supply of water to animals during transit. On this point I beg to draw your attention to the enclosed copy of the report of the Transit of Animals Committee. I am directed to state that the suggestion of the committee as regards covered waggons, and as regards food being provided, shall be taken into consideration by their Lordships. I have the honour to inform you that of the 44 stations suggested by your society to be included in the schedule to the Transit of Animals (Water) Order of March 1871, it is already proposed to include 25 in the next order of Council relating thereto. Of the remaining 19, at 13 stations the traffic is so small as not to call for the expenditure necessary to supply them with water. We are in communication with the authorities of three on the subject of water supply; and it has been reported to this office that the supply of water to the remaining three would involve a very large outlay. I have the honour to be, Sir, your obedient servant,

ALEXANDER WILLIAMS, Sec.

The Secretary of the Highland and Agricultural Society of Scotland.

The letter and relative report were referred by the board to the Special Committee on the Transit of Animals.

The following are the noblemen and gentlemen who will be proposed by the directors for election at the general meeting of the society on the 17th current, to fill the vacancies in the list of office-bearers:—Vice-Presidents: The Most Noble the Marquis of Lothian and the Right Hon. Lord Dunglass. Extraordinary Directors: Sir Hugh Innes Campbell of Marchmont, Bart.; Sir George H. Scott Douglas of Springwood Park, Bart.; Sir G. Graham Montgomery of Stanhope, Bart., M.P.; Allan Elliott Lockhart of Borthwickbrae; David Robertson of Ladykirk, M.P. Ordinary Directors: Sir David Baird of Newbyth, Bart.; Sir Henry J. Seton Stewart of Allanton, Bart.; William Aitchison, Linhope, Hawick; George Harvey, Whittingham Mains, Prestonkirk; David Milne Home of Wedderburn, George Auldjo Jamieson, C.A.; John Munro, Fairnington, Kelso.

Mr. KENNETH MACKENZIE, C.A., the society's auditor, submitted abstracts from the accounts for the year 1870-71, which were signed, in terms of the bye-laws, by two members of the Finance Committee and by the auditor.

The business for the general meeting on the 17th of January was arranged as follows:—Office-bearers to be elected; election of members; accounts for 1870-71; accounts

of the Argyll Naval Fund for 1870-71; thanks to be voted to Local Committee, &c., Perth Show, 1871; arrangements for Kelso Show, 1872; requisition from Stirling district for show in 1873; district shows, 1871, and grants for 1872; cottage competitions, 1871, and grants for 1872; chemical department; veterinary department; premiums awarded in 1871 and offered in 1872 for essays and reports; forestry department; contents of No. 7 Transactions, and report by Committee on Publications.

The list of candidates for election at the general meeting was submitted.

The Secretary reported having attended meetings of members at Kelso on the 15th, and at Stirling on the 22d, when the premium list for Kelso and classes of stock for the proposed show at Stirling in 1873 had been approved, subject to a few alterations.

A letter was read from Mr. Hugh Fraser, Balloch of Cal-loden, Secretary of the Inverness Farmers' Society, expressing the desire of the Committee of Management of his society that the Highland Society's show be held at Inverness in 1874. The board instructed the Secretary to inform Mr. Fraser that, should the counties connected with the Inverness district request the directors to hold the show at Inverness in 1874, the directors will be prepared to recommend the same to the general meeting at the proper time.

Various awards were made on reports by the different committees appointed to read and consider the papers lodged since the general meeting in June. The names of the authors of the successful reports will be announced at the general meeting. Mr. Menzies was authorised to state that, on application to him, silver medals will be awarded to the authors of the papers with the following mottoes should they feel inclined to accept of them, namely:—On the stem and branch pruning of conifers—Motto, Non amputatum. On planting and rearing of shrubs, &c., in plantations for ornament or as under cover for game—Motto, Do the likeliest, and hope the best. On the soils suited for the different kinds of forest trees as indicated by the plants that grow naturally upon them—Motto, Pro Grege.

The following report on Fiske's apparatus for steam cultivation by Professor Macquorn Rankine, LL.D., C.E., F.R.S.S., L. and E., consulting engineer to the Society, was read:—

I was present at the trial of the above-mentioned apparatus at Yester Mains on the 11th November, 1871; and I have to report as follows: The chief peculiarity of the apparatus is the transmission of power from the engine to the windlasses by means of a comparatively light endless driving rope, driven at a speed that is high in comparison with the speed at which the plough is dragged. I approve of this mode of transmitting motive-power, as being conducive to lightness and to economy both in first cost and in working; and such have been found by experience to be the results of applying a similar principle to the transmission of power for driving manufacturing machinery. The mechanism is well contrived for the purpose; it is easily and expeditiously managed; and it worked in a most satisfactory and efficient way during my inspection. The only defect which I could observe was a tendency to heat at the bearings of the windlass pulleys, and of the corner pulleys; and I consider that this defect might be removed by improving the construction of these bearings so as to distribute the pressure more uniformly, and over a greater surface. I cannot make any report as to the actual economy of power in the apparatus; for I was obliged by an engagement at a distance to leave the ground before any dynamometrical experiments could be made.

Report was remitted to the Committee on Steam Cultivation.

A letter was read from Mr. Peter Cameron, of 5, Brown Square, Edinburgh, sending a pattern shoe the Glasgow smiths are making for their horses in frost.

The general meeting was held in the Society's Hall, George IV. Bridge, Edinburgh, Sir James Gardiner Baird, Bart., in the chair.

The CHAIRMAN said the first thing he had to do was to propose that Her Majesty the Queen be elected a member of this Society. They were all aware how warm an interest his late Royal Highness Prince Albert took in agricultural societies, and how successful he was at the competitions of these societies with stock raised on the royal farms at Windsor. Her Majesty had kept up that home farm, and took a warm interest in the success of agriculture, knowing how much the success of this empire depended upon its agricultural prosperity.

Mr. GEORGE HOPE, Fentonbarns, proposed that Her Majesty should be made an honorary member.

The CHAIRMAN said that it was the request of Her Majesty that she should be made a member of the Society, and not an honorary member.

The Chairman's motion was then agreed to.

Sir WILLIAM MAXWELL-STIRLING moved the adoption of the appended address to Her Majesty. He thought it was quite unnecessary to enlarge upon the feelings which were to be found in this address. He was sure not only the gentlemen present, but all the members of the Highland and Agricultural Society would cordially concur in every word of the address:

To Her Most Gracious Majesty the Queen. Most Gracious Sovereign,—We, your Majesty's most dutiful and loyal subjects, the Highland and Agricultural Society of Scotland, incorporated by Royal Charter, assembled in general meeting, beg leave humbly to approach your Majesty, and to express deep and heartfelt sympathy in the great sorrow and anxiety into which your Majesty, the Princess of Wales, and the rest of the Royal Family, were plunged by the alarming and dangerous illness of your beloved son His Royal Highness the Prince of Wales. We also beg to offer your Majesty our warmest congratulations on the favourable change that has taken place in the health of His Royal Highness, and the decided progress that he has made towards a complete recovery. Our desire and prayer is that your Majesty may be comforted amidst these trials and afflictions, and be sustained and strengthened in all duties; and that His Royal Highness the Prince of Wales may be completely restored to health, and that his life may be spared to be a great blessing to your Majesty, to himself, and to the nation. Sealed with the corporate seal, and signed at the desire and in presence of a general meeting of the Society by Sir James Gardiner Baird, Bart., chairman, in the absence of the Most Noble the Marquis of Tweeddale, K.T., President of the Society. Society's Hall, Edinburgh, 17th January, 1872.

Sir WILLIAM GIBSON-CRAIG moved the adoption of an address to the Princess of Wales. He felt it was quite unnecessary to say anything to gain the concurrence of the meeting to every word which it contained. Whatever the distress of Her Majesty had been during the illness of the Prince of Wales, the distress must have been quite as intense in the case of Her Royal Highness the Princess of Wales:

To Her Royal Highness the Princess of Wales. May it please your Royal Highness,—The Highland and Agricultural Society of Scotland, incorporated by Royal Charter, in general meeting assembled, humbly offers to your Royal Highness its sincere sympathy on the recent illness of your illustrious Consort His Royal Highness the Prince of Wales. At the same time the Society takes this occasion to express its congratulations on the recovery of His Royal Highness, and its sincere hope for his continued health. The earnest prayer of the Society is that he may be long spared to be a blessing to your Royal Highness, his family, and the nation. Sealed with the corporate seal, and signed at the desire and in presence of a general meeting of the Society by Sir James Gardiner Baird, chairman, in the absence of the Most Noble the Marquis of Tweeddale, K.T., President of the Society. Society's Hall, Edinburgh, 17th January, 1872.

The meeting unanimously adopted the addresses, and the Secretary was authorised to forward them to the President of the Society, the Marquis of Tweeddale, for transmission to Her Majesty and the Princess of Wales respectively.

Sir WILLIAM GIBSON-CRAIG submitted the accounts of the Society for the past year, from which it appeared that the income from all sources amounted to £7,600, and after deducting

expenditure there remained in the Royal Bank a balance of £457 ls. 4d. The accounts were approved of.

Admiral Sir WILLIAM JOHNSTON read the account of the Argyll Naval Fund, from which it appeared that the sum of charge was £5,698 14s. 3d., and the discharge £5,498; the balance in bank at the 30th November, 1871, being £298 14s. 3d.

Mr. GILLON, of Wallhouse, said that, from the accounts submitted, it would be seen that the General Show at Perth in July last was not only able to clear itself, but to leave a probable surplus of about £99.

The thanks of the Society were given to the Lord Provost, Magistrates, and Town Council of Perth; to the Commissioners of Supply for the counties of Perth, Forfar, Fife, and Kinross; and to others who had given their aid to the Perth meeting.

Mr. GILLON reported that the arrangements for the general show at Kelso were in a highly satisfactory state. The show has been fixed to take place on the 31st July and 1st and 2nd August.

Mr. GILLON also reported that the directors had agreed to requisitions forwarded to them from the counties of Stirling, Dumfries, and Clackmannan, and the western division of Perthshire, that the Show for 1873 should be held at Stirling.

Mr. CAMPBELL SWINTON reported that during the past year the Society's premiums and medals had been in operation in 276 different localities. The money premiums awarded amount to £319 10s., besides 2 medium gold, 9 silver, 185 medium silver, 53 minor silver, and 176 plough medals. For 1872 the directors suggest for the approval of this meeting the following grants: Six districts for cattle premiums, at the same rate as last year—viz., £17 and 4 silver medals each, besides a special grant of £5 to the Shetland Society; three districts for stallion premiums at £25, three for mares at £7 and a silver medal each, and one for entire colts and fillies at £16 and 4 silver medals; seven districts for sheep at £16 and 5 silver medals each. The premiums for cattle and sheep are given to each district for three alternate years, and, in the intermediate years, the Society gives 4 silver medals for cattle and 5 for sheep. The premiums for horses extend over six successive years, commencing with the stallion premiums for two years, followed by the premiums for mares for other two years, and ending with the colt and filly premiums for a similar period. One district for swine at £7 and 3 silver medals; two districts for dairy produce at £16 and 4 silver medals; and in place of the 4 medium gold and 6 silver medals formerly competed for at the Kilmarnock Cheese Show, the directors this year recommend that a sum of £20 should be placed at the disposal of the Ayrshire Association. Seventy-five districts, for 250 medium silver medals, for green crops, best managed farms, best male and female animals, poultry, seeds, &c.; the plough medal under the usual conditions; and £50 and a medium gold medal to the Edinburgh Christmas Club.

The report was adopted.

Mr. H. M. INGLIS reported that in 1871 the Society's money premiums and medals had been offered in 41 districts, that competitions had taken place in 26, when £27 and 62 medals were awarded; and that the directors suggest the following grants for 1872—viz., 23 districts for cottages and gardens at £3 and 4 silver medals each; 21 districts where the money premiums are given by the proprietors for 42 medals—two to each district; the gold medal to the proprietor in Scotland who shall report the improvement of the greatest number of cottages in 1869, 1870, and 1871; the gold medal to the proprietor in Scotland who shall report the erection of the greatest number of approved cottages in 1868, 1869, 1870, and 1871. The rules of competition for the several prizes are contained in the general list of premiums for the current year.

Hon. GEORGE WALDEGRAVE LESLIE said the Land Improvement Commissioners in London insisted upon the arrangements in cottages in Scotland that were unsuited to the climate, and he hoped the directors would take some strong steps in assisting landowners who tried to get their lands improved.

The report was adopted.

Dr. ANDERSON reported on the state of the chemical department, which during the past year had presented the usual features. The work, which during the first half of the year had been above the average, had been somewhat smaller during

the latter half, though on the whole it had been considerable, for during the whole year 330 analyses had been made for members of the Society, embracing nearly every kind of manure, many feeding stuffs, soils, waters, and a variety of materials of interest to the farmer; some of these had been of great excellence, but too many were of inferior quality or adulterated. During the past half year a variety of matters of interest and importance in relation to the management of the laboratory had been under consideration, and especially a proposal which had been made that he should publish the names of dealers in inferior or adulterated manures. After very careful consideration on the part both of the Chemical Committee and the directors it was resolved that when cases of flagrant adulteration occurred they should be reported by him to the directors, who should, if they saw fit, authorise the publication of the names of the parties concerned. He himself should have preferred a more direct course, so as to avoid the delay which, in some cases, may occur from this arrangement; but the Board, acting under the best advice, thought it was the safest course, and he trusted that it would meet the approval of members, for he was satisfied that it ought to work well for the protection of the farmer. He had already reported one case to the directors which he thought worthy of notice, and hoped he should receive permission to publish the details. Another case had recently occurred of a manure of very inferior quality, which he thought should be made public, but which illustrated a difficulty he feared must sometimes be encountered. On completing the analysis, he wrote to the member who sent the sample, asking for the guaranteed analysis and name of the seller, but his application had been without effect, for he was without an answer to his letter, though he still hoped he might receive the required information, which should be at once referred to the directors. Several other interesting cases had also occurred, the publication of which seemed to him to be undesirable, though he thought attention should be called to one of them as indicating the amount of caution required by all persons engaged in the purchase and sale of such articles. He received some time since a sample of oil-cake from a dealer of the very highest respectability, with a statement that an analysis was required for the satisfaction of their customers, but that they believed it quite unnecessary, for the cargo came from merchants of the highest character, altogether above suspicion, and in whom they had the most perfect confidence. On examination it proved to be highly adulterated, more than half of it being French mts. Another sample sent by the same dealer was likewise found to be adulterated, but not to so large an extent. Of course, these cakes were no longer offered for sale, and I am sure the Society will agree with me in thinking that the name of the dealers should not be made public, as the circumstances must be considered as, on the whole, creditable to them. They show, however, how great is the caution that must be exercised even under the most favourable conditions. During the past half year some progress has been made in investigating the subject of scab in potatoes, to which reference had been made at a previous meeting, but, as he had then anticipated, it was necessary to continue the investigations on the produce of the past season, as the data from the crop of the previous year was not sufficient. Scab had not been abundant last season, but he was promised material for prosecuting the investigation, which, however, had not yet reached him. During the past year also, the field experiments, extending over a complete rotation, had been completed, and, he trusted, would be ready for publication in the forthcoming number of the "Transactions." These results, though interesting, are not all that could be desired, for they had been peculiarly unfortunate in weather, the seasons having been singularly unsuited to bringing out the effects of artificial manures. For some time back the Chemical Committee had been actively engaged in devising a scheme for conducting field experiments on a better system than that hitherto in use in this country, and more in accordance with the present state of scientific agriculture, and they were most anxious to obtain the consent of the Society to the establishment of an experimental station somewhat on the principles of those which had been in existence for some years in Germany. Mr. Goodlet of Bolshan, who is much interested in this matter, had taken it up with great energy, and he and Dr. Anderson had been engaged in a long correspondence in endeavouring to get all the necessary information. They had now got a

great deal, part of which had been laid before the Chemical Committee, and they expected soon to have a definite plan ready, which they trusted would meet with approval. They were, however, most anxious that abundant time should be taken for consideration, so as to make it as complete as possible, and avoid future difficulties. They were fully satisfied that it must be taken up in a purely scientific spirit, and that unless this is closed, the movement must prove abortive, and their only fear is, that they may not receive full support in this respect. Farmers in this country are very different from those in Germany, where scientific education has made a progress altogether unknown here, and our farmers prefer what are called "practical experiments," and are slow to appreciate the advantages to be derived from the establishment of the principles of agriculture, which are still most imperfectly understood, and to which the attention of the German experimental stations is mainly directed. It would be unnecessary, and indeed premature, to enter into any further details here; but he ventured to hope that it would obtain the cordial support of practical farmers. He had no doubt that it would be supported by those who took the trouble to examine the subject. He only regretted that we have not in this country a body of farmers familiar with science, such as is to be found in Germany, fully capable of appreciating the value of inquiries, some of which must be unintelligible and probably appear unimportant to those who are unacquainted with science. It was impossible to predict immediate results from such a station as it was proposed to found; but if the members will only have patience to wait and give science time and far play, he had no doubt the results would prove satisfactory and highly beneficial to practical agriculture.

A vote of thanks was passed to the directors for the trouble they had taken in the chemical department.

Captain TOP, of Howden, reported in regard to the Veterinary Department the appointment of Mr. Thomas Walley, member of the Royal College of Veterinary Surgeons, in the place of the late Professor Duns.

Mr. WALKER, of Bowland, reported that the following premiums had been awarded for Reports lodged in November, 1871:

£30 to Mr. Robert Scot Skirving, Campdown, Drem, for a Report on the Agriculture of East Lothian.
 Gold medals or £10 to each—to Geo. Armatage, M.R.C.V.S., The Bank, Hertford, for a Report on Abortion and Premature Labour in Cows, Mares, and Ewes; Hugh Borthwick, Old Caberstone, Innerleithen, for a Report on Lambing and the Diseases incident thereto; Duncairn Clerk, writer, Oban, for a Historical Account of Farming Covenants in Scotland; the Rev. John Gillespie, A.M., Mouswald Manse, Dumfries, for a Report on the same subject.
 Medium gold medals or £5 each—to Laurence Anderson, Northfield Cottage, Liberton, for a Report on the Agriculture of Peebleshire; Robert Laidlaw, Summerhopeburn, Selkirk, for a Report on the Natural History of the Sheep Tick.

Mr. WALKER also announced the premiums for competition in 1872.

Mr. IRVINE, of Drum, reported that at a late meeting of the board it had been renitted to the Committee on Publications to consider and report on the probable expense, and also on the expediency of publishing the Transactions in volumes, in place of numbers annually. The committee had accordingly taken the subject into their careful consideration, and reported in favour of the proposed change. The directors approved of the suggestions contained in the report by the committee, and the Transactions for February, 1872, will appear as a complete volume.

The SECRETARY laid on the table a report by Mr. Swinton, of a trial of steam cultivators, which took place on the 11th November, at Easton Mains, already published. He also submitted a report by Professor Rankine, on the trial of the Fiskin steam cultivating tackle, also published.

Mr. IRVINE, of Drum, reported with reference to the appointment of a committee to consider and report on the system of engaging farm servants, that queries on the subject had been circulated among some of the leading farmers in each county in Scotland. These queries were now in course of being returned, and a meeting of committee will soon be called to consider the answers received.

THE TENANT-RIGHT PRINCIPLE.

So great, and so far so general, has been the feeling of disappointment on the appearance of Lord Leicester's lease that many will be tempted again to dispute the dogmatic assertion as to any such indispensable condition of tenure. The Norfolk farmers are perhaps more particularly prone to uphold the long lease, but surely any committee of agriculturists must have been terribly over-riden before they passed such clauses as now stand embodied in the Holkham model. For our own part we have steadily declined to admit the infallibility here assumed, as we question very much whether a two-years' agreement framed on a fair TENANT-RIGHT principle will not be found as a rule to work better than any holding of ten times the duration, even if backed by quasi-liberty of action, full power to deal with the produce, and so forth. And the country, moreover, would seem to be fast coming to the same opinion, as everywhere we see the question gathering as it goes. In fact, with a lease or without a lease, there must be compensation clauses, and a man whose main provision is that towards the close he shall have so much time to run the farm out again to its original condition, is simply putting the clock back. The Holkham lease is curiously silent as to any plan of securing the occupier and keeping up the cultivation of the land, and one can scarcely understand how a committee, comprising owner agent and tenants, should have been so strangely oblivious of so essential an enactment.

This omission is the more remarkable as it is day by day becoming clearer that the relations between landlord and tenant cannot be put on too business-like a footing. At a dinner at Shrewsbury, it was stated that "a manufacturer who has a twenty-one years' lease, within two of its expiry seeks a renewal, if he arranges well; if not, he has to pay for dilapidations, and I imagine these could be as well assessed in land as in buildings. But, after all, has not the British farmer the best tenure when he rents from one of the noble or ancient county families, who feel a pride in retaining their tenants? I would say, when you rent under these landlords be content, and do your best; but if you rent under a cotton lord, then have a lease, as the same talent which realized the land would seek for the largest possible profit from the investment." There was a time, no doubt, when such outrageous nonsense as this would have had its weight; but that day is gone, and no man now who knows anything of the land question would venture on such an argument as that if you hold under a cotton lord you must have a black-and-white agreement, but if you hold under a real lord you should be content with the county-family pride, kindly feeling, and all that sort of thing.

The speaker, however, was not one of the county families of Shropshire, not one of the tenant-farmers of Shropshire, not one of the land-stewards, but a gentleman who when he began to talk upon land premised that "this was a subject about which I dare say many of my hearers will think I know but little," an opinion in which we should thoroughly agree with them; while he added that he "had never invested in land and never rented land," facts which we should certainly have assumed from the tone of his address. This honourable gentleman was Mr. Figgins, who spoke we believe as one of the members for the borough of Shrewsbury, and who of course was corrected forthwith by one of the leading agriculturists of the county. Mr. Bowen Jones said:

"The sound of Tenant-Right is alarming to many minds, and amongst them—judging from what I can catch from the remarks of the hon. member for Shrewsbury, with whose views I generally agree—of his also, simply from non-consideration. I am in a position to appreciate, as much as any man, the value of the sentiments he expresses with regard to the feeling that should exist between landlord and tenant; but I cannot conceive why Tenant-Right should interfere with this good understanding, for it means nothing more and nothing less than security for capital invested for which a tenant has not derived a return, and could be easily settled in the form of an agreement or by arbitration, *if generally recognised*, without the assistance of a measure in Parliament." And, again, "the dense population of this island demands food at a rate that we can't now anything like supply; but I believe that the resources of our soil, developed to its full capabilities, would at the present time almost fulfil the requirements; though I fear this will never happen without security being given for capital invested in the soil, the effect of which would be to increase the value of the land, and thereby prove to the advantage of the landowner; improve the position of the tenant, because he would be enabled to secure larger returns from the soil, and elevate the condition of the labourer, because the production of larger crops would require a greater amount of labour." When in London, or wherever Mr. Figgins employs his capital, we presume that he does so in a business-like manner; and if he desire to stand well with the Shropshire squires and farmers he cannot do better than advise them to secure themselves equally against absolute loss or unfavourable contingency, instead of giving utterance to clap-trap platitudes, which if people do not laugh at it is simply because they know better manners.

At the dinner of the Hexham Farmers' Club last month, after a paper giving a history of TENANT-RIGHT had been read, the Chairman of the Club, Mr. Grey, a man who has always shown himself to be very jealous of the Landlord's Right, and who has very slowly come round, said: "A lease of itself without Tenant-Right had a tendency to the 'up and down' system of farming—running down a farm at the end of a lease—which was natural. But he thought if a lease was combined with compensation there was no reason why good farming should not be carried on to the end of the lease. He admitted that it was a very difficult subject, but the difficulty was not insurmountable, and a scale might be established to give compensation under different circumstances." We would call the especial attention of the Holkham committee and of Lord Leicester's agent to these remarks, as Mr. Grey has the reputation, like his father before him, of being one of the most able stewards of lauded property in the three kingdoms. And yet generally good as was the tenour of this discussion, it was not kept altogether straight, the secretary of the Club, Mr. Trotter, doing his best to put the meeting wrong: "Mr. Wrightson had quoted many authorities on the question of Tenant-Right, but in no case did two of them agree, because they were fidgety and wrong: they played upon the fringe of the subject, as it were, and did not go to the principle of it. He held that as to the improvement made by the tenant in the farm, the increased value of it was the true measure of that improvement. He was not in favour of the tenant getting the full value of that improvement, but only a fair

and judicious part of it." Well, who in the world is or ever was in favour of the tenant getting the *full* value of his improvement? If this be something more than playing on the fringe of the subject, there is scarcely a word of worth Mr. Trotter said but has been said over and over again, and upon which certainly many of the authorities quoted by Mr. Wrightson are thoroughly agreed. Five and twenty years since it was thus written: "Let the Act contain a definition of the principle, 'a right to claim compensation for unexhausted improvement;' and to this Mr. Pusey put his signature, so that at least two of these authorities were agreed; while the *unexhausted* and not the *whole* has ever been the main feature of the argument. As Mr. Bowen Jones said at Shrewsbury, "it means nothing more or nothing less than security for capital invested, for which the tenant has not derived a return." Still, Mr. Trotter talks as if he were the first discoverer, although he does not talk very clearly when he holds that "the increased value of the farm is the true measure of improvement." Of course if there be no improvement there can be no compensation; but improvements are of a more or less durable character, for which a man should be paid in proportion to the time he had been allowed to recoup himself. When he has been paid so far, the landlord would reap any additional advantage from the permanent improvement of the property, so that a tenant would not be recompensed precisely by what Mr. Trotter calls "the increased value of the farm"—a very false principle to go on, as the tendency of all good cultivation is the increased value of the land.

T E N A N T - R I G H T .

At the annual dinner of the Hexham Farmers' Club, Professor WRIGHTSON read the following paper:

Tenant-right had been too often discussed to allow of my coming before you armed with new arguments. Such is not my intention; neither, I venture to say, is it what you expect. The Government of this country, and, as more immediately affecting a meeting of farmers, the landlords of this country, are in a great measure ruled by public opinion, and it is as guiding public opinion that such meetings as the present are valuable. Would that the farmers of this country better understood the value of their individual and united opinions. How often are members of Parliament influenced in their views by contact with well-informed farmers? How often are game bills, local taxation bills, contagious (animals) acts, modified by the notions of agricultural associations such as this? I think it necessary to remind you of this fact, because the great mass of farmers are not yet roused to a sense of the importance of united effort. Unlike the members of other professions or callings, and in spite of the means now at their disposal for combined influence, they remain isolated, and refuse to take part in discussions which closely touch their interests. Hence we might conclude that no section of the community were better off—none clearer of Government or other grievances, which from time to time we hear muttered in private, in a way altogether futile were it not for the muttered complaints. The position of the tenant farmers no doubt has its bright side, but I venture to assert that it has sad drawbacks which not only affect the men who occupy it but the community at large. It is not my object to-day to open up all the difficulties which beset the farmer in developing his business to the utmost of his knowledge and means. We have to do with one of them only, which may be expressed as follows: An enterprising farmer may lay out hundreds or thousands of pounds in cleaning, fertilising, draining, or otherwise improving his land. Several years may elapse during which time the business has been carried on at a loss or very small profit, and yet the grateful land is ready to give back with interest the capital already incorporated with it. It is exactly at this point that the need of Tenant-right makes itself evident. The tenant

may die, leaving a wife and young children who most speedily quit. The landlord may be succeeded by a needy, greedy, or unprincipled person, who at once proceeds to raise rents or eject tenants; political difficulties, game disputes, and offences of various kinds may arise, any of which are sufficient, at a six months' notice, to sever the connection between landlord and tenant, and, except in certain favoured localities, the unfortunate tenant is robbed much in proportion as his occupation has been improved by his management. The position of the tenant farmer is the reverse of satisfactory in all this. It may be summed up in the word "insecure." We have heard much lately about the land question, the land monopoly, peasant proprietors, large and small farms, entail, primogeniture, and such like. Much might, doubtless, be improved, but I am far from viewing sweeping changes with favour. The English rural economy in which the land is owned by one class, farmed by a second, and actually tilled by a third, has resulted in the finest farming in the world. Whatever theoretical reasons may be urged against this old established system, for God's sake let us be careful how we change it for new fangled notions, which might not be found suitable to our national constitution. England is nearly all let to farmers, and cultivation is brought to the highest perfection upon large farms and upon large estates. The immense mass of food produced annually in this England is produced by tenants, and I maintain that whatever shackles the farmers of this country diminishes the food supply. £10 and £12 per acre, and even larger sums (Mr. Mechi says £15) may be profitably expended in ordinary farming business. This is equal to from one-third to one-fourth of the entire value of the land, and yet look at the legislative enactments for protecting the landlords, and contrast them with the hopeless legal incapacity of the tenant. "I recently read a paper," says Mr. Mechi, "before the Midland Counties Farmers' Club at Birmingham, where I met the most wealthy, intelligent, and enterprising farmers of an extensive district. In the discussion which followed it was painful for me to hear from every speaker that the want of security of tenure and valuation for improvements sat upon them like a heavy cloud." The same feeling prevails throughout the country, and demands our most serious attention. We have, indeed, come to this point. Knowledge and wealth have increased, new improvements have been invented, new means for increasing the fertility of the land have been discovered, stock has been improved, and yet the old relations between landlords and tenants are tenaciously preserved. I say it is impossible to apply the knowledge now possessed by farmers unless they are secured from loss by a lease, a comprehensive Tenant-right, or, better still, a combination of both. I have read almost everything that has been said upon this subject of Tenant-right within the last two or three years, and have been much struck with the unanimity of opinion which exists with regard to it. Landlords and tenants appear to be agreed as to the principle of compensation, and, while it is by no means uncommon to hear men of experience declaim against leases, it is rare to hear this other means of security condemned. Mr. James Howard, M.P., in closing a meeting of the Farmers' Club, London, in May, 1870, after a discussion on this subject, said, "I believe that nothing would tend more to the advancement of agriculture in this country than a well-considered Tenant-right." The Shropshire Chamber of Agriculture came to the conclusion in 1869, "that in the opinion of this meeting it is necessary for the encouragement of a better system in the cultivation of the land that some legislative enactment should be obtained, giving to the tenants compensation for unexhausted improvements in the case of buildings and drainage, the landlord's permission having been obtained." The "North of England Chamber" has appointed a committee to go thoroughly into the whole question of Tenant-right. The Monmouthshire Chamber has done the same. The Essex Chamber voted unanimously that "it is highly desirable that a simply defined law of Tenant-right should be compassed by the Legislature for securing to the tenant compensation for unexhausted improvements in his holding." The Thirsk branch of the North Riding Chamber of Agriculture have resolved "that this Chamber recognises in the advancement of agriculture, the necessity, in the interests of both owner and occupier, of a re-adjustment of covenants, affording a greater freedom to the tenant in cropping land, and such additional security by lease or compensation clauses as will secure to the tenant reimbursement for the outlay required,

and that it is essential for the further development of agriculture that ground game should be abolished." Two years ago the Staffordshire Chamber, led by Mr. Carington Smith, moved "that the recognition by the legislature of the principle of Tenant-right would promote the interests of landlord, tenant, and labourer, and also increase the prosperity of the nation at large." I have troubled you with these resolutions because it appears to me right that agricultural associations should strengthen each other's hands in this matter, and not allow the useful result of debates in sister societies to die away, but rather to echo and re-echo throughout the land until they meet with their proper answer. English Tenant-right is no newly raised question. Its history and true bearings were very well traced by Mr. Corbet in May, 1870, before the Farmers' Club, London. The first year in which that club held any regular series of discussion meetings was 1845, and in December of that year Mr. Shaw, of the Strand, introduced the subject of "Tenant-right as between Landlord and Tenant." In the succeeding month an adjourned discussion on the same subject followed. In January, 1847, Mr. Shaw took up the subject from the landlords' point of view, when the club went with him in declaring "that a well regulated system of Tenant-right would be beneficial to the landlords of this country." After this, Mr. Pusey brought in his bill for the improvement of agricultural Tenant-right in England and Wales. In the summer of the same year the Wenlock Farmers' Club offered a prize for the best essay "on the necessity of some legislative enactment to secure the tenant farmer the benefit of his improvements, &c.," this prize being taken by Mr. Corbet, second editor of the *Mark-Lane Express*. In 1848, a committee of the House of Commons was appointed to take evidence on, and inquire into, the agricultural customs of England and Wales in respect to Tenant-right, of which Mr. P. Pusey was chairman. The fate of this movement to legalise Tenant-right was thus sealed by the Commons' Committee—"That any attempt to make its general introduction compulsory would be met by great practical difficulties, and your committee rely for the general and successful adoption of the system on mutual arrangements between landlords and tenants." In 1851, Mr. Caird, as *Times'* commissioner, decided altogether against Tenant-right, and the question remained in a more or less quiescent condition for many years. It is, however, within the last twenty years that agriculture has made its most rapid advances, and if Tenant-right was desirable in 1847 much more is it so in 1872. An extraordinary activity or restlessness has crept into all classes, and in addition to increased knowledge we have an infinitely greater facility in communicating with each other both personally and as bodies corporate. The Irish Land Bill also made many people look to our own system of tenancies. Thus a Warwickshire farmer in April, 1870, wrote to an agricultural paper that "if it be just and needful to give the Irish tenant of four acres security for his outlay in improvement, why should not the English tenant of four hundred acres have the same?" And again, "if farmers were adequately represented in Parliament the six months' notice to quit, the confiscation of improvements, and the destruction of crops by landlords' game would soon become things of the past." Likewise, Mr. Nevill (himself a landlord) said last July to the Nottingham Chamber, "he could not see why, if the Irish tenantry were to be rendered secure from any casualty, the English tenantry should not have the same advantage." At an exceedingly influential meeting of the Staffordshire Chamber (December 13th, 1869), over which the Earl of Harrowby presided, his Lordship, in words which I can by no means agree with, pointed out the difference between the English and the Irish tenants, and said, "he (the Irish tenant) frequently laid out a great deal of money and then found that the law offered him no protection. A state of things so wholly devoid of common sense was unintelligible to an English farmer." Lord Lichfield, however, "utterly failed to see why any principle which might fairly be applied to Ireland should not be applied to England." It is certainly difficult to see why the capital of an English tenant should be insecure, unless it is to be found in the fact that he is quiet under his grievances, and not disposed to commit agrarian outrages. Having glanced at the history and present position of the question, we have next to consider what Tenant-right really is, to strip it of its ambiguities, and finally to see whether any practical basis of action can be fixed upon in order to accelerate its more general

adoption. Firstly, we must not confound English with Irish Tenant-right. The Irish tenant not only requires payment for improvements but for the "good-will" of giving up possession. Such a Tenant-right not only looks up the capital of a young tenant commencing business and diminishes the rental value of land, but it can hardly be supposed in any sense to develop agriculture. Neither must we use that ambiguous expression "Custom of the country" as quite tantamount to this right. Tenant-right might be, and to some extent has been, grafted upon the "customs" of various districts, but too often the customs do little more than protect the way-going tenant from loss upon any necessary labour he might have performed for the benefit of the incomer. I cannot, however, agree with Mr. Corbet in maintaining a strict and definite distinction between custom and Tenant-right. I rather view the customs as the existing machinery by which improved ideas as to Tenant-right are to be carried out. Neither do I think that we have reason to be altogether depressed with regard to the progress of Tenant-right. The principle, as we have already seen, has been granted by every leading agriculturist, namely, that the tenant's capital should be made secure upon his leaving his occupation. It is also desirable that a way-going tenant should have sufficient inducements to farm well up to the end of his tenancy. I would also urge that in advocating Tenant-right, which is essentially the payment by the landlord for improvements made by the tenant, we are bound to allow that, in case the farm can be shown to have been damaged during the occupancy, the tenant should be equally willing to reimburse the landlord for such damage. The exact state of Tenant-right throughout the country has been too little investigated. Lincolnshire Tenant-right is in every one's mouth, and it no doubt is the oldest and probably the most perfect system in existence in this country. This right is, however, incorporated in the customs of the country and can only be viewed as an extension of them in a direction according with modern improvements. With regard to other counties we have in some cases a liberal way-going crop with an allowance in addition. In Monmouth the outgoing tenant takes an away-going crop of wheat on one-third or one-fourth of the arable land, and has liberty to sell clover, hay, straw, and roots. Usually when a way-going crop is allowed it appears to stand in the place of other ordinary allowances. In Derbyshire there is a limited compensation; bones, lime, guano, rape dust, &c., are allowed for. The allowances for half-inch bones extends over six years on grass land when pastured; if mown, for three years; on some farms one-third or one-half of the cost of the oilcakes consumed during the last year is allowed. In Huntingdonshire, the allowance for lime in equal proportion over four years; one-third is allowed for linseed cake or other artificial food used the year before quitting. The outgoing tenant is allowed for carriage on materials for building, and on drainage tiles, and also five years in equal proportions for draining. In Kent, Surrey, and Sussex, the amount to be paid to out-going tenants has been complained of as excessive. In Leicestershire and Rutlandshire, in a Michaelmas entry, the in-comer pays for all acts of husbandry, bought manures and their carriage, and one year's rent and rates on the summer fallows. He has to take the root crop at consuming prices, the bought manures and carriage being also charged. On Lady-day entries the summer fallows are paid for as at Michaelmas. For drainage there is an allowance of four or six years according to circumstances. Linseed and cotton cake are allowed for at the rate of one quarter for the last two years, and the same allowance is made for lime, but without the cost of the carriage for the second year. In Nottinghamshire, on a Michaelmas entry, the incoming tenant pays on the dead or summer fallows for the acts of husbandry, the rent, rates and taxes, also the manure or lime applied and the labour of applying them. He also pays for the turnips at a consuming price, together with two-thirds of the cost price of the bones or other approved artificial manures. On the grass land he has to pay for one-third of the value of the cake consumed in the preceding summer, and for the hay and straw of the last summer at a consuming price. On the Lady-day takings the out-going tenant is allowed liberally for the wheat on fallows and for turnip fallows. He receives consuming price for hay and straw, also for manure made from produce of preceding summer and labour thereon; quarter the cost of the linseed cake consumed in the last two years, which payment, however, is not quite

to be classed as customary. Staffordshire, raw bones and lime are allowed for extending over three years. Draining is paid for, the allowance extending over seven years. The out-going tenant also has an away-going crop of wheat. In the North and East Ridings of Yorkshire the principle of compensation is spreading. In the West Riding custom varies considerably. In some instances the out-going tenant is even allowed on the turnip or summer fallow one year's rent and taxes, as well as for all manure purchased, the dressings of the fallows, and the manure, making a deduction for the green crops. On the "half tillage" land (seeds, bean and pea stubble) he is allowed half the rent and taxes, the dressings, half the manure, three-fourths for bones, and one-third for guano, less half the deduction for the last green crop. In other parts, purchased manures are paid for at full cost if no crop has been taken, but after a crop the out-goer receives half the value. The above information (from Mr. Cadle's able essay on the Farming Customs of England) shows us clearly that Tenant-right, or regard for tenant's capital invested, is extending. The very terms, oilcake, bones, drainage, are too recent in agriculture to allow of this being doubted, and such allowances have evidently become engrafted with the old system of custom. In other countries, unfortunately, no such reasonable allowances are made, but there is little doubt that the good example already quoted will spread, and the true value of what are somewhat ambiguously termed unexhausted improvements will become better understood. Before proceeding to speak upon the actual adjustment of the claims of an out-going tenant who is leaving his farm in a high state of artificial fertility, directly brought about by the investment of his own capital, I have a word to say upon the whole general question as it affects the country at large. The public have a right to demand that the country shall be well cultivated. Or whether they have a right or not it is not improbable that the question of the public or commonweal (commonwealth) in this particular may be mooted. No man, however, will develop the capabilities of the soil to the utmost (especially clay soils) unless he is made secure to an extent which Tenant-right can scarcely reach to. It is only the purchaser, the owner, who can reap the advantages of his agricultural improvements by the real increase in value of his estate, which may be realised by an opportune sale. Every one cannot be an owner of land, and a man of small capital is not to be advised to lock up money in a 3 per cent. investment. It is, however, only just to the public, as well as to the farmer, that tenant's capital should be secure, and security can only be obtained by giving the tenant a more permanent interest in the land. I need not, I think, argue in favour of a lease before the present company, because I believe most of the gentlemen present have made up their minds in favour of this mode of tenure. A lease, among other things, is accented of favouring an "up-and-down" system of farming. You improve for seven years, you keep up the fertility for seven years, and you take it out for seven years. This is, I cannot help thinking, both natural and commendable, but it is nevertheless unfortunate for the country, and may be remedied by the introduction of Tenant-right clauses into leases; and I believe this would knock the ground from under those who would make out a case against leases. These gentlemen object to leases, first, because under them there is this "up-and-down" system of farming; and, secondly, because the end of the lease gives an opportunity for raising the rent, which, in the case of a yearly tenancy, rarely occurs. Now, if you introduce a proper Tenant-right, the first of these objections clearly gives way, and I believe the second would also disappear, because if the farm were really improved by tenant's capital the Tenant-right should come into operation at the end of the lease as a set-off against any proposed rise of rent. There is only one other suggestion which I shall mention as apparently meeting the case; I refer to the proposal to do away with the six months' notice to quit altogether as far too short a period for a farmer to transfer his business. Substitute a two years' for the six months' notice and introduce a proper Tenant-right, and we should soon witness an immense improvement in the agriculture of the country. I do not mean to say that this is yet applicable to the condition of backward districts where the tenantry are too poor and ignorant to be trusted with greater powers than they at present enjoy, but I do think that the condition of the greater part of England justifies a greater liberty of action being given to the tenant farmers. There are other men be-

sides the Rev. E. Smythies, of the Central Farmers' Club, who are ready to tell us that expressions of general opinion are in this case of no use whatever, and that "what farming men want is to know exactly what the out-going tenant has to receive—what proportion of the whole." There is much truth in this, and yet it is of importance to be thoroughly agreed upon the principle before proceeding to elaborate a system. I am also confident that with our present knowledge and agricultural organisation there would be little difficulty in coming to a decision as to the money value of unexhausted manures, foods, and other more permanent improvements, such as drainage, claying, marling, building, &c. So far the attempt has been made without sufficient regard to chemical evidence, and I certainly would recommend that any committee for adjusting the claims of Tenant-right should not only represent the landlord and tenant interest, but also be a representation of scientific knowledge in the form of a good agricultural chemist, whose opinion would be valuable in fixing the relative value of manures and foods as fertilisers. In recommending this, the only real difficulty I see is the few men there are in this country who know anything at all of agricultural chemistry. No system of Tenant-right can be sound which is not based upon truth. The estimates must be based upon experience, upon direct experiment, and upon chemical evidence, and not upon the mere dictum of a land agent. Glancing at some actual and proposed schemes of compensation, there is sufficient evidence of confusion. Mr. Piper, before the Swindon Chamber (December, 1870), quoted from the scheme of an eminent land agent, in Devonshire, as follows: The tenant to receive compensation for unexhausted improvements according to the following rules. Rule 1.—Bone manure with turnips over 5 years; 1st year the tenant to be allowed 20s. in the £1; 2nd, 10s.; 3rd, 5s.; 4th, 3s.; and 5th, 2s. Rule 2.—Guano over 4 years: 1st year 20s. in the £1; second, 8s.; 3rd, 4s.; 4th, 2s. Rule 3.—Superphosphate of lime and other manure for turnips the same as Rule 2. Rule 5.—Corn, linseed or oilcake, fed in the last year of tenancy by fatting stock or sheep, to be repaid 20 per cent. Rule 6.—Purchased yard, pig, or any decomposed manure, 1st year 8s. in the 20; 2nd year 4s. Contrast this scale with that proposed by Mr. Bellamy to the North of England Chamber, in which two-thirds of the bones and guano are to be paid for after a green crop, and if a way-going crop is taken after such green crop, then one-third only of the expense. Dissolved bones only to be allowed for at the rate of one-sixth of their value after a green crop, and are supposed to be worth nothing after a corn crop has been taken. No mention is apparently made by Mr. Bellamy of purchased foods spent on the land. In Lincolnshire the whole of the bones are paid for after a turnip crop, and one-fourth of the oilcake bills for the last two years. Mr. Masfen, in his admirable paper on "A Farm Agreement" (London, 1869), said, "Mr. Cadle proposes compensation for artificial food and manure, and that on a liberal scale, and I think it will meet with many supporters; as far as the food is concerned, I will go with him, but I am not disposed to sanction his views as regards superphosphates—the last year but one for a manufactured manure. The last year, in my opinion, goes far enough." This last opinion is supported by the experiments of Mr. Lawes, of Rothamstead, but controverted by Dr. Voelcker. Far my own part, I have long doubted the efficacy of superphosphate manures as a means of really improving land except indirectly. Their effect is generally ended with the crop to which they were applied. At the same time, by increasing the yield of turnips and of straw, they eventually increase the "muck-heap," and that will be of more permanent advantage to the land than any expenditure on so-called "artificial." With regard to the value of food residues they, as being incorporated with and enriching the farmyard manure, are probably of greater permanent value than guano and superphosphates. The differences in the value of the manure produced by various feeding stuffs is, however, so great that no person is entitled, as in the rules above cited, to class corn and cake together. According to Mr. Lawes, the money value of manure made from one ton of decorticated cottonseed cake is £6 10s., or not much below the price of the cake itself; that from one ton of rape cake is worth £4 18s. 6d.; and that from one ton of linseed cake £4 12s. 6d. On the other hand, the manurial value of the residue of one ton of barley consumed is only £1 10s.; of wheat £1 13s.; of oats £1 15s.; and of malt £1 11s. 6d. The fixing of the payments

for manures and feeding stuffs is, then, the most difficult part of the problem before us, and it appears to me that Mr. Lawes' opinion should be carefully considered with reference to it. Mr. Lawes has done much towards proving that land may be kept in condition equally by artificial manures and by farmyard dung; but when he comes to consider the permanency of effect from the various classes of manures used, he arrives at the following conclusion: "That when active nitrogenous manures, such as Peruvian guano, ammonia salts, or nitrate of soda, are applied in only the moderate quantities usually employed in practical agriculture, the unexhausted residue left in the soil after the removal of a corn crop has but little effect on succeeding crops. That when rape cake, and other organic purchased manures, which yield up their fertilising elements comparatively slowly, are employed, the unexhausted residue left after the removal of the first crop, may yield an appreciable amount of increase throughout a rotation. That when farmyard dung is employed the effects may be apparent for a still longer period. That when mineral manures, such as phosphates, salts of potash, &c., are used, the effects of any unexhausted residue are too slow and gradual to admit of any determination of their value." Again, "It has been shown by references to direct results that some important constituents of manure either leave little or no unexhausted residue in the land, or leave it so combined within the soil, or so distributed throughout it that it produces little or no appreciable effect on succeeding crops. Some manures, on the other hand, have been shown to produce marked effects for several years after their application. It is obvious, therefore, that it would require a very complicated sliding scale to enable us to estimate the value of unexhausted manures, under the many varying conditions that would arise." It is considerations such as these which led Mr. Lawes to the following very practical expression of opinion: "It would, I think, be more satisfactory that all valuations should, if possible, relate only to what is above ground. Nor do I see any difficulty in doing full justice to the out-going tenant without taking into account the value of the unexhausted residue of the manures which have already yielded a crop." The three items upon which Mr. Lawes would rely as the basis of a valuation in favour of the out-going tenant are—the farmyard manure made during the last year of the occupancy; the manure from purchased food which has not grown a crop; and the straw of the corn crops of the last harvest." This conclusion of Mr. Lawes has been criticised (especially by Mr. Smith, of Woolston) as providing an insufficient remuneration for the out-going tenant. It is, however, capable of expansion, and appears to me to be based upon a sound principle, for after all the expenditure in various fertilisers is of less importance than the effect of such an expenditure. What better claim can a tenant have for compensation than by showing that he has raised the yield of the corn crops and the quantity of manure upon the farm? If this has been done by proper means, I cannot see how a simpler basis for calculation can be obtained than by the results of such good cultivation as above indicated. Here then is one means by which nearly all the tenant's land improvements may be compensated to him. It is not, however, perfect because it does not provide for the outlay of money upon drainage, liming, marling, claying, &c., which may have been done by the way-going tenant, and which still have a prospective value. These improvements must still be paid for on a sliding scale not difficult to construct. Improvements to houses and buildings, roads and fences, will readily be valued by experienced men, and thus a complete system of Tenant-right may be elaborated.

Mr. GREY, the President and Chairman of the dinner, congratulated the Club upon the successful paper that had been read to them by Professor Wrightson. It was the last of the year, and the winding up of a succession of papers, all of great interest, and many of them had excited a considerable amount of discussion in the Club, which discussions were of great interest not only to themselves but to the country, and they were much indebted to the local papers for reporting all these discussions so very fully. They had the credit in that Club of being a radical lot, and talking of many innovations. Professor Wrightson did not come there to represent the landlord's interest, and though he was certainly no Tory he had thrown into his paper a great amount of caution, if not Conservatism, and counselled the Club not to go in hastily. This led him to one of the principal topics of Pro-

essor Wrightson's paper, which was one that had been mentioned at this Club before. Farmers were very differently situated from manufacturers, from iron-masters, and from people who carried on commercial enterprises in towns and cities, because a farmer's business was one of great isolation. He met his brother farmers when he came to the market, and after doing a certain amount of business he went off home again. Farmers had not hitherto been in the habit of combining to carry out their desires as people in other trades had done. They had made a step in that direction by the Chamber of Agriculture and Farmers' Clubs. He had said before at this Club that if farmers had anything to complain of, instead of grumbling about it at the market, it was necessary for them to combine and press the subject upon the Legislature of the country. In these days of great pressure, Parliament took up those measures upon which they received the most pressure, and their representatives took up those subjects upon which their representatives gave them little or no rest. When an election came, he found generally that all topics of local interest, and all topics which affected the pockets of the farmers, were forgotten altogether, and the candidates at the election heard nothing of them. A candidate in this country was never confronted by a farmer who said to him, "You must oppose everything in Parliament till the local taxation question is brought forward." If he had an opportunity at an election, certainly he would tell the members of Parliament that their members were sent to look after the interests of their constituents, and until farmers combined and forced their views upon their members, and insisted upon what was called domestic legislation being put forward, it would be pushed aside to make room for more exciting subjects. They ought to combine to put out members who refused to represent their interests, and send men who would represent them, as one or two counties had done. It was only in this way that farmers would get their interests attended to. Then, as to Tenant-right, it would be a difficult matter to go into details as to compensation; but Professor Wrightson suggested a combination of lease and Tenant-right as better than either alone. A lease of itself without Tenant-right had a tendency to the "up and down" system of farming—running down a farm at the end of a lease—which was natural. But he thought if a lease was combined with compensation there was no reason why good farming should not be carried on to the end of the lease. He admitted that it was a very difficult subject, but the difficulty was not insurmountable, and a scale might be established to give compensation under different circumstances. He mentioned at one of their recent meetings that Mr. Pusey, the celebrated agriculturist, had in his day attempted something of this kind, but failed to carry it out. He did not despair of it being carried out some day, but unless farmers gave their minds to it, of course no one in Parliament would give their attention to it. The club had carried out these discussions in a spirit of friendliness and good feeling amongst themselves. He stood sometimes rather alone, and he had heard some gentlemen say the chairman naturally takes the landlord's side of the question. His interest as a tenant farmer was considerably greater than that as landowner, and as agent his personal feeling was in the happiness and prosperity of the tenants. As an honest man, however, he must do his duty, and see that the property of his landlords was not deteriorating. He always wished to take an impartial view, and he thought he generally succeeded in taking an impartial view of the case. The impression might be that he took the landlord's view of it because there were no landlords at their meetings; certainly the views he expressed at the meetings were made from a love of fairplay, and it might be from some little opposition, as he took an opposite view when he heard extreme views enunciated at the Club. He never liked to see a man hit hard behind his back; and if he took his part it might be from the spirit of English pugnacity. Amongst themselves these discussions did good, and he hoped they would do good all over the country, and these discussions throughout the country might tend to excite greater interest in agricultural questions, so that at some day they might arrive at a more satisfactory settlement of the arrangements between landlord and tenant. The great object was to carry on the cultivation of the land to secure the greatest quantity of produce from it that it was capable of growing, and the interest of the country at large in the land was to see that nothing was wasted, and that everything pro-

duced all that it possibly could. Would they establish a manufactory and let part of the machinery stand idle if they could get orders to keep it all at work—and when they had land should they only get half of what it would produce if they set properly about it? The question of draining had been brought before them, but it was seldom that tenants in this part of the country had to do any draining. It is generally done by the landlords, but it was capable of adjustment where it was done by the tenant. He had drained land as a tenant-farmer on a short lease, the expense of which was repaid him in a couple of years. He naturally after that cultivated the land in a different way, and it paid him for the improvement. He got the land worth 10s. an acre, and left it worth 30s. an acre. He got no compensation at the end of his lease, though he was far from saying that there should not be a scale established, and that he should have received compensation, but as it was he was perfectly satisfied. He could not, however, go in for the principle that the tenant ought to have the capitalised value of all the increase he had made in the value of the land. He took the land at 10s. an acre, and he left it worth 30s. an acre; but it paid him; he got his money back with good interest, and what right had he to get all the increase capitalised on that farm? The landlord might wish to drain the land of his own free will; but the tenant might go and put his money and get the increased value of the land. The landlord would then say to the tenant that he had it good land, and there was nothing more for him to do. He (the Chairman) did it without his landlord's leave; if the landlord had been consulted, and the law had been that he could claim the value of all the improvement, the landlord would probably have told him to leave it as it was, and that he would make the improvement himself. There were two sides of the question, and he said this in answer to those gentlemen who could see only one side.

Mr. G. H. RAMSAY would not flatter the farmers or landlords; he thought the latter neglected their interests most shamefully. The landlords, he thought, were very careless regarding their true interests; if some of them had been with them that day he thought it would have been better for them, so that they might have helped to ventilate important questions bearing upon the agricultural interest. As to the farmers they were good-tempered, jovial fellows; but when they wished to gather them together, to get subscriptions from them, and do things of that kind, he was sorry to say they were tremendously behind. He said these things because he was anxious to see them prosperous and thriving, and the time was not far off when, by education—education in such matters as Tenant-right—they would become a superior body of men altogether.

Mr. JOSEPH LEE had had an opportunity of being with Mr. Wrightson in Lincolnshire, where there was Tenant-right, so he met with the best farming there that he ever saw in any county in England. He had been through great part of England and Scotland, and he might say the value of sheep and corn might be increased thirty per cent. if the tenant had security for the capital invested in the land. Farming would never be brought to perfection, and the land put into the highest state of cultivation, until the time came when such security was given to the capital of tenants. Some thirty years ago it was difficult to find a man with much capital, but now there were hundreds of them, and they scarcely knew how to invest their capital, many of them joining joint stock companies, and probably another crash would come. How much of this money would go into farming operations if only security was given for their capital? Mercantile men were not like farmers, and would not invest unless they saw some chance of some security for their capital being returned. He thought that if anything could be done to follow up this paper of Mr. Wrightson's, if any method could be devised which would give the landlord a fair share of the value of the improvement made by the tenant, and also what the tenant should have, it would be a great boon to this country. A committee might be appointed to draw up a petition to Parliament on the subject. It would be a difficult thing to do; but if such a thing could be done, it might help forward this question. As Mr. Wrightson had remarked, if Tenant-right was a good thing for Ireland, why should it not be a good thing for England? He thought that many things might with justice be done which would be a great advantage to landlord and tenant.

Mr. MATTHEW SMITH said that what they wanted was a Tenant-right that would be liberal both to landlord and tenant.

They could not have such a Tenant-right as was established in many parts of the south of England. He knew a gentleman who farmed in the south, and who was now living in this neighbourhood, who left a farm of little more than 100 acres, and received £500 compensation. If such a Tenant-right was applied, what would be the consequence of it? Supposing the farm was 400 acres, and the Tenant-right £2,000, where would the tenant get £2,000 to pay for Tenant-right and commence farming? What they wanted were leases that would do away with hares and rabbits which were eating up the food of the country. He would give the tenant a liberal lease, and let him have power to dispose of a portion of his crop in the best way he could, as the tenant would be able to keep the farm up in condition by manures. What Tenant-right could they expect Parliament to adopt? They could not expect to get the Tenant-right they had in Ireland, which he considered one of the greatest evils that ever existed in any country. Look at the thousands of people that had lost their lives in that country through it. He held that the Tenant-right which would be beneficial to both landlord and tenant was the one they wanted.

Mr. W. TROTTER, the secretary, said that it was of no use discussing these subjects and wishing to have the laws altered, unless they took some steps to put their wishes into execution, but so far as the discussion had gone that day, his idea of Professor Wrightson's paper was that it tended to make confusion more confused. Mr. Wrightson had quoted many authorities on the question of Tenant-right, but on no case did two of them agree, because they were fidgetty and wrong—they played upon the fringe of the subject, as it were, and did not go to the principle of it. He held that as to the improvement made by the tenant in the farm, the increased value of it was the true measure of that improvement. He was not in favour of the tenant getting the full value of that improvement, but only a fair and judicious part of it. He would leave to the landlord that part which might represent to some extent, and closely approaching to it, that indefinable money value, which, at their previous meeting, Mr. Robb alluded to as illustrating the progress of the times. On that point a good deal of misapprehension existed, as he held the improvement in the value of farms, judging from the farms he had known from his earliest years, was owing to the improvement in their cultivation. There were farms not worth a penny more than they were twenty or thirty years ago, because they had remained in the same state; yet some farms in the Bywell parishes had increased 100 per cent. in value simply by the improvements made by their tenants, and not by the landlords. Many landlords when they came into possession of an estate expended large sums of money upon each of their farms, and they expected to get their money back again in increased rents; then, why object to pay compensation to the tenant who made improvements? He knew of work done by landlords themselves, and it was let at prices which no tenant farmer would give who knew anything of his business. That work could have been done much cheaper by the tenant, and the land made of much more value to the landlord. A feeling of justice ought to predominate with them; and he held that a tenant farmer, when improving his landlord's land, was fully entitled to the value of the improvement he made, or a fair share of it.

Mr. YOUNG said that Tenant-right was an important subject. No Tenant-right could be perfect without a lease, and compensation at the end of the lease. It was a subject which he had considered for some time, and he thought the simplest way was for a farm to be let for 15 or 20 years, and at the close of the lease the rent of the farm was not to be increased more than a tenth. If the farm had increased more than one-tenth, any increase above that ought to be valued by parties appointed by both sides, and the tenant should receive the extra amount for his improvements. As to unexhausted improvements, compensating a tenant according to the quantity of manure applied to the land in the last years of a lease might not always be satisfactory. A person who did not understand much about these manures, perhaps might just go and buy something and put it on the land, and get paid compensation for it, and make a good thing out of it in that way. If a farmer wanted to get all the benefit he could out of the land in the last year or two of his lease he applied lime or nitrate of soda freely to the land, and got out of it in that way. The simple way for a Tenant-right was, if the farm was im-

proved, for the tenant to receive the increase in the value of the farm, but let it be a little valued at a little above the present rent, and if the farm was deteriorated let it be valued, and the landlord be paid for such damage by the tenant.

Mr. H. T. THOMPSON wished to have some explanations on certain portions of Mr. Wrightson's paper, and he asked that gentleman why he put a higher value upon phosphates than nitrate of soda or things of that kind. On many soils nitrates grew an excellent crop on the first application, and they often heard it said that the vegetable matter left in the land went far to produce good crops. If nitrate produced a good crop, there must be a large quantity of vegetable matter left in the soil to decay and be food for succeeding crops. Then, again, a higher value was placed in the paper upon manures derived from cakes than that from meal. So far as he was able to speak, as a practical man, he had used cake a good deal, and the manure was greatly improved, but he knew several farmers who used meal. These farmers said that those who used cake allowed the manufacturer to pick their pockets, while they knew they were dealing with honest fellows when they were dealing with themselves. He would like Professor Wrightson to give them a little more information on that point, as he knew a good deal of scepticism existed amongst farmers in regard to it. As to Tenant-right, he was sceptical upon that matter, but he would not express his opinions upon that matter that day.

A vote of thanks to Professor Wrightson having been carried,

Professor WRIGHTSON, in acknowledging this, said he hardly expected to be called upon to make a reply, but since questions had been raised upon his paper he would do so. In reference to the view taken by the secretary, certainly he could wish that some simple method could be arranged, so that a share of the increased value might be taken by the tenant and a share by the landlord, but he was afraid that instead of being a simpler method it would be quite as difficult as taking the improvements in detail. Of course, many circumstances might arise to give land an increased value; they might have a town growing out in a certain direction, a railway going across it, and many incidental improvements, which had nothing to do with agriculture, but which increased the value of the property. When they came to share this improvement and capitalise it, the sums would be so large that either party would have to pay, that each party would be careful to shun any such agreement, binding them to pay a large sum. They had sometimes a reduction in rent as well as an increase, and probably the tenant of the farm on which the reduction took place was not in good circumstances, and if his deficiencies were to be capitalised it would be very difficult to recover it from him. These were the difficulties, but there also seemed to be unfairness in it as well. They must remember, in the case of the tenant's improvement of the farm, that that improvement laid latent in the farm. It was like a man making a hole down to coals; he made a hole down a seven-foot seam, but was he to claim the whole of the coal which laid there? It was much the same in the case of a tenant draining a farm, and opening up treasures which really existed, and which any landlord might have done. He thought the proposition of the secretary would make the landlords jealous of letting their farms at all, as they would think it would be too good a thing. He was not aware that he put a higher value upon phosphates than upon nitrates; and whatever might be said in the paper about the value of phosphates, these remarks were made in speaking of tenant-rights in various counties. The difference which existed in the tenant-rights in different counties showed them the immense amount of confusion in which the question was veiled, and that of itself ought to convey a valuable lesson to them, and make them wish for a simple form of tenant-right, and to do away with all these confused systems. With reference to phosphates, they acted very quickly upon the land, and so far as his definite experiments had gone he had not much reason to think that either superphosphates or nitrate of soda had much residual effect. It was true that they increased the crop, but they did not appear to have much residual effect. With reference to manures and feeding stuffs, he could not well speak of them together; they were so very different. He reminded them of what Mr. Lawes pointed out—that these active nitrogenous manures, which they called artificial manures, did not appear to have much effect in improving crops after the crop to which it had been particularly

applied. When they came to organic manures, there was a residue from cake and farmyard manure, so that, while they got an increase in the first crop, they probably got an increase in every crop for a greater length of time than even a rotation. Although they got good crops from artificial manures, as well as from organic manures, yet there was a difference in their value as respectively increasing the value of the land. He would make a difference between simply artificial manures, such as nitrogenous phosphates, and those of an organic nature, which kept yielding up products to plants for more than a year. He was asked why the manure from meal should have less effect than that from cake, but they must consider the nature of meals and of cake. In linseed-cake there was a good deal of husk, and the percentage of husk was very much increased by the very fact that the oil was pressed out of it. The husks of seeds, just as in the way of bran of corn, although not of such a nourishing character as wheat, contained a great deal of nitrogenous and mineral matter, while the oil which had been pressed out of it contained very little of nitrogenous and mineral matter. Meals contained a large amount of starchy materials, and although of its feeding qualities there could be no question, it did not make such good manures as cakes. In cakes there was a large amount of nitrogenous and mineral matters; in meals, made from unbroken and whole corn, there was a very large amount of starchy materials not of manurial, but of feeding value, and there was a less amount of what they might call actually fertilising materials. He had to apologise for the rather complicated nature of his paper, but when he wrote it he looked forward to the fact that it would be published in the papers, and probably looked at again and read and discussed. He had been at some pains to collect his information on the subject, and he had placed in his paper the comparison between Tenant-right in the various counties, and also opinions of good authorities, which, when placed in juxtaposition, could be the more readily compared.

THE FRENCH PEASANT FARMERS' SEED FUND.

The following correspondence has been forwarded us for publication:

To H. M. JENKINS, Esq., Secretary, Royal Agricultural Society of England.

Sudbury Hall, Derby, January 9, 1872.

Dear Mr. JENKINS,—Accompanying this you will receive the copy of a letter addressed to me by the French Foreign Minister. It is unnecessary to allude to it further than to say that if it has been a source of pride to me to have been associated in the performance of a philanthropic work for the benefit of a neighbouring country in its hour of bitterest distress, I shall never forget, that although circumstances placed me at the head of our work, it was the sagacity of my colleagues which brought about the result for which, apparently, I receive the honourable recognition of the French Government. The cordial manner in which my colleagues have always co-operated with me, is a guarantee that they will join in viewing this testimonial as a record of approval of our united efforts, and that they will be satisfied that it should rest in my keeping. Whenever we do separate we shall all look back to our intimate association with unmixed pleasure. Believe me, yours very faithfully,
VERNON.

To Lord VERNON, President of the Committee for the Distribution of Seeds to the French Farmers.

Versailles, November 30, 1871.

My LORD,—The work which the committee, under your presidency, undertook in coming to the aid of those among the farmers of France who were the victims of the war, by causing seeds to be distributed among them, was of such great value to France, that the President of the Republic can but feel desirous of offering you some mark of his gratitude. The President has desired me to present you with a vase of Sèvres porcelain. I lose no time in forwarding this souvenir to you, and I rejoice to be, in this matter, the interpreter of the Chief of the State, and to have this opportunity of expressing to you, my Lord, my personal sentiments of high regard.

REMUSAT, The Minister for Foreign Affairs.

THE WOOD PIGEON.

At a meeting of the East Lothian Agricultural Society, Mr. Harvey, Whittingham Mains, reported that since March last 13,000 wood pigeons had been killed in the county, and that the special fund for the promotion of their destruction amounted to £55. A tremendous number of these birds had visited Haddingtonshire this year, and it was very annoying to see the immense flocks of them completely destroying the fine fields of red clover. Lord Elcho, Lord Blyth, the Earl of Wemyss, Sir Hew Dalrymple, and other proprietors, had aided the Society in their crusade against these destructive birds, and he implored the remaining county gentlemen to follow such a good example. Landlords could not do a more gracious act towards their tenantry, who paid large rents for their farms, than to order their foresters to pull down the nests of the wood pigeons, and to create still greater havoc than at present among the winged pests.

Mr. DURIE (Barney Mains) said he was sure a great number of wood pigeons came to East Lothian from Berwickshire, and the proprietors in that county ought to be asked to join in the onslaught against the pigeons.

Sir HEW DALRYMPLE said he did not believe that wood pigeons bred in Haddingtonshire. A great many had been killed from year to year. He did not know whether it was complimentary to Mr. Harvey's persecution of them or not, but the number which visited the county this year was something marvellous. He had seen the other day a dell of red clover positively blue with them; they were as thick as they could stand together. It was a well-known fact that proprietors who shot these birds in the neighbouring county found them full of the grain, not which was growing there, but which had been grown thirty miles away.

Mr. FLETCHER (Salton) believed that the wood pigeons came from Norway.

The CHAIRMAN said he was sure every member of the Society felt how much they owed to Mr. Harvey for his endeavours to get rid of these blue pests which covered the fields. He sympathized with Mr. Harvey in his statement about the intolerable nuisance it was to farmers to see the fields destroyed by these birds. He did not believe that Haddingtonshire was responsible for their breeding. He knew that in Suffolk flocks of these and other birds came and went no one knew where; and really Mr. Harvey, to succeed in extirpating them, would require some sort of international wood pigeon league. There was no doubt that these birds came from foreign parts as well as from Berwickshire; but meantime they must continue their efforts to give them on their visits a warm reception.

Mr. ROUGHHEAD (Myreside) believed that one cause of the great increase of wood pigeons was the gun-tax. If they could get Mr. Lowe to take the tax away, plenty more wood pigeons would be destroyed.

The CHAIRMAN said he would not envy the members of any deputation sent by the Society to Mr. Lowe in regard to the gun-tax.

It is intimated that more funds for the destruction of the wood pigeon would be called for in March next.

A CHRISTMAS RIDDLE.

After the letter H.)

'Twas whispered down Westward, 'twas muttered at Ross,
And Aberdeen echoed its worth as a cross;
On the confines of earth 'tis permitted to rest,
As lands o'er the ocean its presence confessed.
'Twill be found in all spheres, from Booth or from Bares;
Is seen out at Sydney, and prized in the States.
It has given to man even its very last breath
To provide for his feasts, though the cost be its death.
To its breeder it brings wealth and honour and fame,
Is the prop of his house, and his very best game.
Without it the red-coat and white-face would roam;
But woe to the workman who drives it from home!
O'er Erin's green pastures its voice will be heard,
Nor yet from the Lowlands of Scotland be scared.
It has warmed up the hearts of the swells round the ring,
As Strafford or Thornton its praises may sing.
Oh! let it not seek foreign shades and herce suns,
But bid for it briskly, for now "the glass runs."

—The Gentleman's Animal.

THE FARMERS' CLUB.—The following subjects have been selected for discussion during the year 1872. February 5: The Use of Method, Arrangement, and Observation in the Management of a Farm; proposed by Rev. G. Davies, Hall Place, Romsey. March 4: The Transit of Live Stock; Mr. A. Welch, Southall. April 1: Vegetable and Fruit Farming; Mr. T. Scott, Knaphill, Woking. May 6: Principles affecting Cultivation, Manuring, and Cropping; Mr. J. J. Mechi, Tiptree, Kelvedon. November 4: Freedom in Cultivation and Security of Capital; Mr. T. Horley, jun., The Fosse, Leamington. December 9: Some Comparative Results of Large and Small Farm Systems in providing Food for the People; Mr. H. M. Jenkins, 12, Hanover-square, London, W.

THE WILLIAMS TESTIMONIAL.—This movement has now been fairly launched, the list already including a number of good names. Although the Committee of the Farmers' Club declined as a body to take any action, Mr. Cheffins the Chairman, Mr. Congreve, Mr. Leeds, Mr. Tretwey, and Mr. Spearing, all past Chairmen, with other members who happened to be at the last meeting, at once offered to aid the object.

TESTIMONIAL DINNER.—A number of his friends, invited Mr. Winterton, the well-known auctioneer and farmer of Alrewas Hays, to a public dinner in recognition of his success as an agriculturist, and for having established the Smitfield in the town of Lichfield. Lord Lichfield was in the chair. Mr. Winterton took the second prize of the Royal Agricultural Society last summer for farms.

PRESENTATION.—The workmen in the employ of Messrs. Ransomes, Sims, and Head, have presented to Mr. G. A. Biddell, C.E., as a mark of their respect, a silver inkstand, weighing 65 ounces, on which was the following inscription:—Presented to Mr. George Arthur Biddell, by the workmen employed at the Orwell Works, Ipswich, as an appreciative token of the good feeling which has existed uninterruptedly between him and them for 20 years, during which time he has eminently filled the position of manager.—January 1, 1872.

THE ESSEX AGRICULTURAL SOCIETY.—At the Annual Meeting at Chelmsford on Friday Mr. J. R. Vaizey was elected President for 1872.

THE FRAMLINGHAM SCHOOL.—The Rev. W. W. Bird, B.A., for some years second master of All Saints' School, Bloxham, has been elected to the head mastership of Albert College, Framlingham, Suffolk.

THE OXFORDSHIRE AGRICULTURAL SOCIETY.—The Banbury Agricultural Association having declined to continue the amalgamation for a stock show, it was decided at the general meeting that the Oxfordshire Society should revert to its old plan of holding its shows in various parts of the county, and the following resolution, moved by Mr. Mumford, and seconded by Mr. Garne, was carried: That this Society be open to receive applications, and contributions towards the expenses, from any towns in the county desirous that its show should be held there during the last week in May next. Applications to be sent to the Secretary, on or before March 1st.

THE DEVON COUNTY AGRICULTURAL ASSOCIATION.—At a meeting held at the Castle, Exeter, the Duke of Somerset in the chair, it was resolved, on the motion of the Earl of Devon, to establish a County Agricultural Association for Devonshire, which will hold annual exhibitions of stock and implements alternately in the northern and southern division of the county. It is intended that the Society shall work in harmony with the Royal and Bath and West of England Societies, and to that end a special resolution was passed, providing that when either of those societies holds its meeting in Devonshire the county meeting shall not be held, but the council shall have power to contribute to the prize fund of the larger association for the encouragement of local breeds.

A FRUIT FARM.—Mr. Varden has worked out the idea of a fruit farm on a vast scale, near Pershore. His estate is 250 acres. Of this about 140 acres are planted with fruit trees. These include 60,000 gooseberry bushes, 100,000 currant trees, and about 6,000 plum trees, to say nothing of pear, apple, and other trees. The extent of the farm may be imagined when we mention that for weeks during the fruit season Mr. Varden has sent off four or five tons of fruit a day. One lot of currants sent away one day to one customer weighed seven tons.—The Garden.

WARWICKSHIRE AGRICULTURAL SOCIETY.—At the adjourned annual meeting, Lord Leigh in the chair, it was decided to hold the next show at Warwick, it being understood that Birmingham was looking forward to a visit from the Society in the following year. As to the annual show being held alternately in the northern and southern divisions of the county, it was decided to abolish this restriction, so that in future the meeting may be held in any town within the county.

THE HAMPSHIRE CHAMBER OF AGRICULTURE.—At the annual meeting, the president, Mr. W. W. B. Beach, M.P., in the chair, the report stated that the position of the Chamber is sound and satisfactory, financially and otherwise. There was a balance amounting to £26 15s. 8d., which was nearly spent. Mr. Beach was re-elected president. The annual dinner followed, but there was only a small company present, "in consequence, no doubt, of the extreme wetness of the weather."

HEREFORDSHIRE CHAMBER OF AGRICULTURE.—At the annual meeting, in Hereford, Mr. J. B. Downing in the chair, the attendance was very thin. The Report could "not allude to a greatly increased number of members, yet they have the satisfaction of reporting that the losses from death and other causes have been compensated by the election of new members;" and then went on to review the proceedings of the past year. Mr. Rankin was elected chairman, and Mr. J. Morris, of Madley, vice-chairman for the ensuing year. Professor O'Hara was appointed analytical chemist for the ensuing year. Rule 17 was altered as follows: "That the Chamber subscribe £6 annually, and appoint a deputed member to attend the meetings of the Council according to the rules of the Central Chamber." At the annual dinner, 23 members only of the Chamber assembled in honour of the occasion—just about one-third of the company expected and prepared for!

HUNGERFORD CHAMBER OF AGRICULTURE.—A special meeting of the members was convened to listen to an address on the subject of "Local Taxation," by Captain Craigie, the secretary to the Local Taxation

Committee in London. The attendance was very limited. Captain Craigie gave a long address. Mr. Williams, of Baydon, proposed the following resolution, which was seconded by Mr. Woodman, and carried: "That this meeting fully concurs in the object sought to be obtained by the Local Taxation Committee, and pledges itself to support the movement; and towards this end it is of opinion that a sub-committee of the Chamber should be formed, to be called 'The Hungerford Taxation Committee.'" Mr. Chandler supported the resolution, and regretted there was so much apathy.

LEICESTERSHIRE CHAMBER OF AGRICULTURE.—The annual meeting was held at Leicester. The report recorded that nineteen new members had been made. The financial statement showed that the expenses of the year had been £54 17s. 1d., and that there was a balance due to the treasurer of £7. The arrears of subscriptions amounted to no less a sum than £54 10s.

THE NOTTS CHAMBER OF AGRICULTURE.—At the annual meeting, Mr. W. H. Barrow, M.P., in the chair, Mr. J. C. Musters was elected chairman of the council for the ensuing year, and Mr. Hemsley, vice-chairman. The annual report stated that, owing to exceptional causes, the subscriptions had fallen short of the year preceding, but a system had been matured of parochial collections, which it was expected would result in the realisation of outstanding arrears and of the amounts at present accruing. Mr. Walker moved, "That, in the opinion of this Chamber, the present system of local taxation is unjust, and ought to be amended, inasmuch as most of the objects for which it is imposed, such as the maintenance of the poor and of lunatics, the preservation of public order, the administration of justice, and the punishment of criminals, are of national, and not merely local, importance, and are for the benefit of all classes; that, therefore, all kinds of property ought to contribute to them, whereas at present, with few exceptions, real property alone is taxed, and personal property is exempt from those burdens." Mr. Musters seconded the motion, which was carried. The annual dinner was afterwards held.

AGRICULTURAL REPORTS.

REVIEW OF THE GRAIN TRADE DURING THE PAST MONTH.

The weather during the past month has been excessively mild for the time of year. Rain has fallen throughout the country very freely, and the soil is now thoroughly saturated to the depth of some inches, thus interfering with wheat sowing. This operation, however, except in the most backward districts, has already been completed. The supply of grass in the pastures and meadow lands is very good for the time of year, and cattle can obtain a fair feed with but little difficulty. Some complaints have reached us with reference to the potato disease, but the losses do not appear to have increased to any material extent. Although the young wheat plant is certainly forward for the time of year, and at present presents a most luxuriant appearance, nothing material has occurred to cause apprehension; but some cooler weather would doubtless be of service in checking its too premature development.

During the past month the position of the wheat trade has not varied to any material extent. The general inferiority of the quality of the produce has interfered considerably with business, and reduced transactions to hand-to-mouth operations, the speculative element being entirely wanting. At the close of last year the stocks of foreign wheat were estimated as follows:

	Qrs.		Qrs.
Stocks in the 11 principal ports Dec. 31, 1871..	1,787,181	Stocks in the 11 principal ports Dec. 31, 1870..	1,349,921
96 Cargoes off the coast at 3,200 qrs. each	307,200	19 Cargoes off the coast at 3,200 qrs. each	60,800
263 Cargoes on passage for orders and direct ports at 3,200 qrs. average ...	841,600	520 Cargoes on passage for orders and direct ports at 3,200 qrs. average ...	1,664,000
Total	2,935,981	Total	3,074,721

However, upon going more minutely into the statistics, it was inferred that the stocks in the smaller ports of the kingdom showed in the aggregate an excess of some 100,000 qrs. It was also argued that the estimate for grain on passage was underrated to the extent of some 150,000 qrs. Allowing the new estimate to be correct, the stock of *foreign* wheat in the United Kingdom would show an increase of something under 115,000 qrs. So far as our own crop is concerned, however, we cannot report so favourably. The reiterated statement that our harvest was sadly deficient so far as the wheat crop was concerned, is certainly confirmed: the actual deficiency being, say, 14 to 15 per cent. below the average. The imports have been on a fair average scale, and will probably continue to be so for some time, as there is still a good number of vessels on passage. There has been a moderate export. In the southern parts of France, prices have had a drooping tendency, but in the northern districts, as well as in Holland, a fair amount of firmness has prevailed. In France, white wheat would be very acceptable; and it is to be hoped that Spain will supplement her hitherto moderate shipments to Bordeaux by more extensive transactions, as well as allowing other nations to participate in her late bountiful harvest. Favourable accounts continue to come to hand from Chili, but from Odessa we hear that the bulk of the fine portion of the crop has already been shipped, and that the condition of that now awaiting transmission by no means comes up to recent samples. The weather will have great effect upon the trade. So far as can be at present ascertained, the demand will be of a hand-to-mouth character for some time; but a spell of frosty weather would induce much firmness. Fine samples, at the present moment, command very full prices.

As regards spring corn, fine malting barley has been in request, and has realised full prices. Oats have changed hands to a fair extent; but inferior samples being plentiful, have receded in value. Beans as well as peas experienced a fair demand during the earlier part of the month, prices ruling 1s. per qr. higher, but this advance was subsequently lost. Maize was dull and drooping in value.

The number of grain cargoes on passage for ports-of-call is 381—namely, 279 wheat, 38 maize, 43 barley, 12 rye, 8 beans, and 1 millettseed, against 655 at the same period last year—namely, 420 wheat, 92 maize, 87 barley, 40 rye, 4 oats, 7 beans, 2 millettseed, and 3 sundries. For direct ports there are at present on passage 34 grain cargoes—namely, 18 wheat, 12 maize, 2 barley, 1 oats, and 1 beans, against 68 at the same period last year—namely, 55 wheat, 10 maize, 1 barley, and 2 sundries. The number of cargoes of seed and Valonia on passage for ports-of-call is 38—namely, 26 linseed, 3 rapeseed, and 9 cottouseed, against 73 at the corresponding period last year, of which 45 were linseed, 5 rapeseed, 21 cottouseed, and 2 Valonia. For direct ports there are at present on passage 1 cargo of linseed, 1 rapeseed, and 6 cottouseed, against 4 linseed, 8 cottouseed, and 1 Valonia.

IMPORTS AND EXPORTS OF GRAIN.

The following statement shows the imports and exports of breadstuffs into and from the United Kingdom since harvest—viz., since August 26, 1871, compared with corresponding period in the three previous years :

IMPORTS.

	1871-2.	1870-1.	1869-70.	1868-9.
	Cwt.	Cwt.	Cwt.	Cwt.
Wheat	19,325,084	14,353,215	20,788,446	11,838,123
Barley	4,651,959	3,639,415	3,354,553	4,468,377
Oats	3,809,180	3,993,746	5,074,129	2,716,549
Peas	427,477	388,238	681,557	673,194
Beans	1,552,430	626,459	861,278	1,323,997
Indian Corn.....	8,452,683	7,605,340	9,076,076	5,378,270
Flour	1,458,495	1,980,617	3,061,150	1,555,321

EXPORTS.

	1871-2.	1870-1.	1869-70.	1868-9.
Wheat	1,700,726	1,168,122	110,230	132,538
Barley	9,180	19,534	6,170	55,312
Oats	57,337	373,095	24,884	38,483
Peas	4,688	28,664	6,583	6,395
Beans	1,484	4,875	942	2,594
Indian Corn.....	14,033	31,568	5,656	178
Flour	32,688	44,5232	7,844	17,634

In the Continental markets there has been no alteration of importance. In America the export inquiry has fallen off, and as stocks have not accumulated to any great extent, it is argued, certainly with some show of reason, that the United States have already disposed of the bulk of their available surplus. The quantity of wheat at Milwaukie in December was 540,824 bushels, against 947,855 bushels in 1870. The exports of wheat from the States from September 1st to December 29th was 1,058,830 qrs., against 1,242,612 qrs. during the corresponding period in 1870.

The hop market has been very firm, although business has not been on an extensive scale. Fine samples have been scarce, and there has not been much demand for yearlings. The best home-grown are now making £17 per cwt.

As regards potatoes, the supplies have been good, and the demand has been heavy, but prices have been tolerably firm. Complaints of disease are becoming more frequent.

REVIEW OF THE CATTLE TRADE FOR THE PAST MONTH.

The cattle trade has been devoid of any feature of especial interest. The mild weather which has prevailed has been unfavourable for killing, and to this circumstance must be attributed partially the depression which has characterised the demand. As regards beasts, the supply has been about an average, and the general quality has not been unsatisfactory. During the earlier part of the month, the tone was firm, and the best Scots made 5s. 10d. and in some few instances 6s. per 8 lbs.; but the demand eventually became very heavy, and a decline of fully 4d. per 8 lbs. took place, the best Scots not making more than 5s. 6d. per 8 lbs.

As regards sheep, the supplies have been moderate, but sufficient for requirements. There has been an absence of animation in the inquiry, but prices have been steady, and the best Downs and half-breeds have made 6s. 10d. to 7s. per 8 lbs.

Calves, the show of which has been good, have sold quietly at about late rates.

Pigs have been in moderate request, on former terms.

The total imports of foreign stock during the past month have been as follows :

	Head.
Beasts	3,027
Sheep	13,896
Calves	668
Pigs	250
Total	17,850

Corresponding period in	Head.
1871.....	10,298
1870.....	21,727
1869.....	12,214
1868.....	20,000
1867.....	24,084
1866.....	25,838
1865.....	16,952
1864.....	9,967
1863.....	11,893
1862.....	8,783
1861.....	2,708
1860.....	6,760
1859.....	9,264

The arrivals of bullocks from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years :

	Jan., 1872.	Jan., 1871.	Jan., 1870.	Jan., 1869.
Norfolk, Suffolk, Essex, and Cambridgeshire	5,800	7,650	6,350	5,184
From Lincolnshire, Leicestershire and Northamptonshire.....	1,700	1,200	1,750	1,850
Other parts of England	1,750	850	2,950	2,140
Scotland	646	910	1,120	2,376
Ireland.....	300	301	1,730	903

The total supplies of stock exhibited and disposed of at the Metropolitan Cattle Market during the month have been as under :

	Head.
Beasts	18,140
Sheep	73,120
Calves	848
Pigs	438

COMPARISON OF SUPPLIES.

Jan.	Beasts.	Sheep.	Calves.	Pigs.
1871	15,028	73,840	314	365
1870	19,251	91,760	1,127	965
1869	19,880	94,830	654	1,201
1868	17,620	86,220	520	1,610
1867	18,150	82,400	756	1,508
1866	24,620	89,390	1,754	2,225
1865	20,669	73,714	1,095	2,370
1864	19,442	80,230	1,019	2,567
1863	20,455	83,422	1,637	2,456
1862	20,680	82,160	853	2,850
1861	17,612	75,240	677	2,000
1860	20,500	92,426	1,067	2,045
1859	19,805	90,520	921	2,400
1858	20,312	80,742	1,108	1,759

Beasts have sold at from 3s. 6d. to 5s. 10d., sheep 4s. 4d. to 7s., calves 4s. 6d. to 6s., and pigs 3s. 8d. to 5s. per 8lbs. to sink the offal.

Pork	3 6 to 5 0	3 4 to 4 2

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The proverbial sternness of January has, during the past month, given way to unusual mildness and abundant rains, though, after the first fortnight, we had two days of strong hoar frost. The nights too have been mostly wet, and some parts of the country have consequently been completely flooded. Field work, therefore, not completed in autumn, will probably have to be delayed till spring, and much valuable time, which otherwise would have been employed in preparation for the Lent corn, be lost. On the other hand the grass has commenced growing, and every green thing has been available for man and beast. Nothing, however, can compensate farmers for the serious damage done to their newly-thrashed corn; the condition of much has been so bad as to render it unsaleable and below millers' wants. We are thus reminded of the crop of 1860, when, with a fair yield, good samples were the exception. Yet, so far as the value of dry corn is concerned, we have rather gained 1s. than lost anything, and foreign samples in store have been constantly in requisition, at unaltered rates, notwithstanding the abundance in granary and the probability of early shipments in spring. Our sales in the 150 towns for four weeks, as compared with January 1871, were 44,211 qrs. short, chiefly, as we suppose, from the fact that farmers have deemed it injurious or next to useless to thrash in the midst of such damp. This quantity for these 150 towns alone, then, has put them out of funds, even at the rate of 50 per cent., to the extent of £110,000, simply on wheat, and for the whole country in a like proportion, at a time when they have scarcely known how to employ their hands. And nothing now seems likely to improve their condition but a dry time and moderate frost. February is mostly wet, and to wait for March winds seems too heavy a demand upon agricultural patience; yet so it must be to avoid sacrifice. By that time we may probably ascertain more clearly the deficiency of France, on whose stocks and imports the prices throughout the world greatly depend. At present that country continues well supplied, and prices have slightly given way, and nothing but a real and heavy pressure will greatly enhance them under the monetary obligations and heavy losses of that state. In Germany, amid the fickle weather, prices have been remarkably steady, as well as in Russia and America, these several countries being the principal sources of supply, and all seem looking for higher rates with the coming spring, whether fallaciously or not. The *Mark Lane Express* has given the usual estimate of the crops, but the accounts respecting wheat so greatly vary that no satisfactory calculations can be made, but the constantly occurring terms, "under an average," and "very bad," as well as "damaged before thatched," leave the impression that the diminution this season will, on the whole, be more than four bushels to the acre. If so, with our increased population, and that of Europe and America, it will be found out, and bring on a pinch just before the harvest, the slowness or severity of which will then be settled by the ruling weather. The following prices were recently quoted at the several places named. Best native white at Paris 66s. 6d., red 64s.; Marianopoli at Marseilles 55s., Ghirka 52s.; wheat in Belgium 57s. to 62s.; Polish at Amsterdam 63s.; Zealand at Rotterdam 47s. to 61s.; wheat at Lausanne 61s.; best red at Hambro' 61s.; high mixed at Danzig 60s.; native at Cologne 58s. 6d.; red at Rostock 55s.; Danish red, cost freight and insurance, 61s.;

Ghirka and Taganrog 43s.; wheat in Spain 49s. 6d. to 53s.; at Naples 57s. 6d.; at San Francisco 62s., cost, freight, and insurance; red at New York 49s. to 51s. 6d. per 480lbs.

The first Monday opened on small supplies of English wheat, with a great falling-off in foreign. But few fresh samples appeared on the Essex and Kentish stands during the morning. Really fine and dry parcels were firm, at the previous currency, though not in active request. Inferior and badly-conditioned were difficult to place. Good foreign red went off more readily, at unaltered rates. Floating cargoes being abundant were about 1s. lower. The country markets, scarcely out of holiday influence, and with very mild weather, ruled firmer than London, in some places noting an advance of 1s. per qr., as Birmingham, Newark, Newbury, Manchester, &c., but there were a few exceptions, as at Loughborough and Thirsk. Liverpool was 1d. higher on Tuesday, and again there was a rise of 2d. per cental on Friday. Edinburgh and Glasgow noted no change in wheat. Dublin was in calm, but not lower.

On the second Monday, native wheat was again in short supply, with only a small increase in foreign. There was once more a great deficiency in fresh English samples during the morning, and really fine and dry lots brought 1s. over the previous quotations, but damp sorts were difficult to get rid of. The business in foreign was on a larger scale, and fine red American in some instances made 1s. improvement, all other sorts being fully as dear. Floating cargoes recovered from the temporary depression, and sold at 6d. to 1s. per qr. above the previous quotations. The country trade this week was quite prepared to follow that of London, and, with very few exceptions, there was a general improvement of 1s. per qr. Liverpool, at the first market, evinced more tone, but on Friday the aspect of the trade reversed. Both Edinburgh and Glasgow improved to the extent of 6d. to 1s. per qr. Dublin was very firm; Belfast only quiet.

On the third Monday, the English supplies were further reduced, but there were good foreign arrivals. During the morning there was scarcely a fresh sample from Kent, and but very few from Essex, and these were of the damp type. Dry lots would have commanded a sale had they been exhibited, but inferior were still neglected. The foreign trade was then, however, very limited, and had sales ex ship been pressed, less money must have been accepted. Cargoes afloat were less in demand, though former values were maintained. As in London so in the country this week, all dry qualities were firm, but farmers found a difficulty in placing such as were out of condition. Liverpool was dull on Tuesday, and 1d. to 2d. per cental lower on Friday. A heavy trade was experienced both in Edinburgh and Glasgow, but quotations were unchanged. Both Dublin and Belfast were calm and unaltered.

On the fourth Monday, there was about the usual short supply of English wheat, but with fair arrivals of foreign from the Black Sea and India. The show on the Essex stands was about the smallest of the season, with nothing from Kent; the condition of all the samples was wretched, the wet weather having lasted so long, and the qualities on sale were quite below the requirements of millers. Dry sorts were wanted, and would have made fully the previous rates, but they were not to be found, excepting at the foreign stands. There, an increased demand was ex-

perienced, but the mildness of the temperature was against any advance. Though most of the floating cargoes had been placed, those then on hand tended downwards in value. Liverpool, on Tuesday, was dull, and 2d. per cental lower. At Hull, Newcastle, and several country markets, there was a calm without any change of value in dry qualities.

The imports into London for four weeks were 16,778 qrs. English, 83,301 qrs. foreign; against 20,827 qrs. English, 50,677 qrs. foreign in 1871. The exports were 4,073 qrs., against 4,431 qrs. The imports into the kingdom for four weeks were 2,685,279 cwt. wheat, 235,837 cwt. flour. The general averages commenced at 55s. 8d. and closed at 55s. 1d.; those of London opened at 60s. 1d., and closed at 58s. 6d. The four weeks' sales in 150 towns were 195,407 qrs., against 239,618 qrs. in 1871.

The flour trade has been quiet and unchanged through the month. Town millers have kept to 50s. as their top price, and about 39s. has ruled as the value of Norfolks, American barrels 29s., while anything extra has been worth fully 2s. per qr. more. There have been good supplies steadily furnished from the country, though foreign arrivals have been light. The imports into London for four weeks were 70,439 sacks, country sorts 6,272 sacks 16,294 barrels foreign, against 86,311 sacks country, 13,085 sacks, 74,153 barrels foreign in 1871.

Though the supplies of maize have only been moderate, the reduced value of beans and peas have lessened the consumption, and American qualities have given way 1s. per qr., not being worth over 32s. per qr. Without a reaction therefore in pulse, we do not see an immediate prospect of a rise in this grain. The London imports for four weeks were 42,008 qrs. against 23,931 qrs. last year.

The supply of British barley has been very short, and the value of good malting sorts has risen 1s. per qr., both in town and country; but the plenteousness of foreign has made the sale dull, and so much formerly heated grinding quality remains on sale that some sorts are not worth over 22s., while malting is held at 44s. The four weeks' supplies into London were 7,155 qrs. British, 62,364 qrs. foreign, against 13,402 qrs. British, 20,959 qrs. foreign in 1871.

The malt trade has been more active through the month, and prices have risen 1s. per qr., with good exports, say, 3,646 qrs.

With regard to oats, our supply has been almost entirely foreign, and that not in heavy quantities, only one parcel appearing from Scotland, and nothing from Ireland. The granaries have therefore been largely drawn upon; but our London stock at the close of 1871 was 480,000 qrs. Fresh 38 lbs. per bushel corn was worth 21s.; 40 lbs., 23s. 6d. The unusually mild weather may keep up supplies beyond expectation, but at present we do not see much prospect of a permanent decline. The four weeks' imports into London in English sorts were only 1,470 qrs., in Scotch 95 qrs., in foreign 135,392 qrs., against 1,473 qrs. English, 151 qrs. Scotch, 89,978 qrs. foreign in 1871.

The supply of beans during the four weeks of home-growth have been good, and of foreign liberal, and the mild weather has so deteriorated the condition of new samples that they have given way 2s. per qr.—Magazans having been sold at 34s. per qr., and other sorts in proportion; but fine old English sorts remaining scarce, have not been reduced in value to the same extent, or even old foreign, Egyptian sorts being about 34s. and Sicilian 38s. per qr. Should farmers still send damp new qualities, we may see prices yet lower; but with a return to frost there may be some reaction in the trade, though foreign supplies seem likely to prevent any great

advance. Imports into London for four weeks 4,715 qrs. English, 9,291 qrs. foreign, against 3,782 qrs. English, 2,914 qrs. foreign in 1871.

Of English peas there have been fair supplies, of foreign a mere nothing; yet the whole trade has been extremely dull, duns being only worth 36s.; maples, unless fine enough for seed, not over 37s. to 38s., and the best white warranted boilers only 40s. The mild weather has kept the value of the latter depressed, and without a frost there seems little chance of a rally. The four weeks' imports into London were 3,609 qrs. English, 243 qrs. foreign, against 1,786 qrs. English, no foreign in 1871.

With moderate supplies of linseed this grain has been quiet, though the value has been maintained, but the warmth of the weather has been against any activity in sales, either of seed or cake, and the late fall in beans and maize has also contributed to lessen the demand. As regards cloverseed and other seeds, prices have risen too much to make dealers anxious to increase stocks. New English red, as well as fine white Cloverseed, have kept at a high range; so little having yet appeared; but American red has been procurable at rather below the rates lately paid. Good trefoil has been a ready sale at full prices. Canary has somewhat improved in value, and spring tares began to attract attention, being offered from Germany at 40s., cost, freight, and insurance.

JAMES GIBBS AND COMPANY,

VITRIOL AND MANURE WORKS,

NEAR VICTORIA DOCKS, LONDON.

OFFICES — 16, MARK LANE, E. C.

SOLE MANUFACTURERS OF THE

PATENT AMMONIA-FIXED PERUVIAN GUANO,

Guaranteed to be made from the finest quality of Government Peruvian Guano, as imported. Has produced equally as good results as the unfixed Peruvian Guano, and is 30s. per ton cheaper. Recommended for all crops for which Peruvian Guano is used, and is found superior to it for Potatoes, Mangold, Beet Root, &c. In districts where the rain-fall is above an average, we recommend it for Turnips. It is not only cheaper, but also much more effective than Nitrate of Soda, as Top Dressing, and its effects are more lasting, as may be seen by the after Crops.

Patent Ammoniated Phosphate. Dissolved Bones.
 Superphosphate of Lime. Bone Manure for Turnips.
 Blood Manure for Roots. Blood Manure for Corn.
 Special Manures for Mangold, Barley, Grass, and Potatoes.

JAMES GIBBS & COMPANY have turned their attention specially to the manufacture of these Manures, which contain all the elements necessary to promote the growth of Potato and Turnip crops. The results have given universal satisfaction, and prove the Manures to be the cheapest yet sold.

The "condition" of the above is made a matter of special care. They are all sifted before delivery, to ensure their being fit for the dry or water-drill.

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by other Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed Permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors, WM. MCKEWAN, General Manager.

“There are very few simple articles of food which can boast so many valuable and important dietary properties as Cocoa. While acting on the nerves as a gentle stimulant, it provides the body with some of the purest elements of nutrition, and at the same time corrects and invigorates the action of the digestive organs. These beneficial effects depend in a great measure upon the manner of its preparation, but of late years such close attention has been given to the growth and treatment of Cocoa that there is no difficulty in securing it with every useful quality fully developed. The singular success which Mr. EPPS attained by his homœopathic preparation of Cocoa has never been surpassed by any experimentalist. Medical men of all shades of opinion have agreed in recommending it as the safest and most beneficial article of diet for persons of weak constitutions.”

C O M F O R T I N G

C O C O A.

“By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. EPPS has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame.”—*Extracted from an article on Diet in the “Civil Service Gazette.”*

At the ANNUAL GENERAL MEETING of the Proprietors, held on THURSDAY, the 1st February, 1872, at the City Terminus Hotel, Cannon-street Station,

The following Report for the half-year ending the 31st December, 1871, was read by the Secretary.

WILLIAM CHAMPION JONES, Esq., in the Chair.

The Directors, in submitting to the Proprietors the Balance-Sheet of the Bank for the Half-Year ending the 31st December last, have the satisfaction to report that, after paying interest to customers and all charges, allowing for rebate, and making provision for bad and doubtful debts, the net profits amount to £93,098 5s. 11d. This sum, added to £4,449 17s. 4d. brought from the last account, produces a total of £102,548 3s. 3d.

The usual dividend of 6 per cent. for the half-year is recommended, together with a bonus of 3½ per cent., both free of income-tax, which will absorb £95,000, and leave £7,548 3s. 3d. to be carried forward to Profit and Loss New Account. The present dividend and bonus added to the June payment will make 18½ per cent. for the year 1871.

The Directors have to announce the retirement of their esteemed colleague, Lord Alfred Hervey, in consequence of his acceptance of the office of Receiver-General of Inland Revenue. Abraham Hodgson Phillpotts, Esq., has been elected a director in his stead, in accordance with the provisions of the Deed of Settlement.

The directors retiring by rotation are: Phillip Patton Blyth, Esq., James Morley, Esq., and Abraham Hodgson Phillpotts, Esq., who, being eligible, offer themselves for re-election.

The dividend and bonus, together £1 18s. per share, free of income tax, will be payable at the Head Office, or at any of the Branches, on or after Monday, the 12th instant.

BALANCE-SHEET OF THE LONDON AND COUNTY BANKING COMPANY, 31st Dec., 1871.

We, the undersigned, have examined the foregoing balance-sheet, and have found the same to be correct.

(Signed) W. M. JARDINE,
WILLIAM NORMAN,
RICHARD H. SWAINE, } Auditors.

London and County Bank, Jan. 25, 1872.

The foregoing Report having been read by the Secretary, the following resolutions were proposed, and unanimously adopted:

1. "That the report be received and adopted, and printed for the use of the Shareholders."

2. "That a dividend of 6 per cent., together with a bonus of 3½ per cent., both free of income-tax, be declared for the half-year ending the 31st December, 1871, payable on and after Monday, the 12th instant, and that the balance of £7,548 3s. 3d. be carried forward to profit and loss new account."

3. "That Phillip Patton Blyth, James Morley, and Abraham Hodgson Phillpotts, Esquires, be re-elected Directors of this Company."

4. "That the thanks of this Meeting be given to the Board of Directors for the able manner in which they have conducted the affairs of the Company."

5. "That William Jardine, William Norman, and Richard Hinds Swaine, Esquires, be elected auditors for the current year, and that the thanks of this meeting be presented to them for their services during the past year."

6. "That the thanks of this meeting be presented to the General Manager, and to all the other officers of the bank for the zeal and ability with which they have discharged their respective duties."

(Signed) W. CHAMPION JONES, Chairman.
The Chairman having quitted the chair, it was resolved, and carried unanimously:

7. "That the cordial thanks of this Meeting be presented to William Champion Jones, Esq., for his able and courteous conduct in the Chair."

(Signed) WILLIAM NICOL, Deputy Chairman.
(Extracted from the Minutes.)
(Signed) F. CLAPPISON, Secretary.

LONDON and COUNTY BANKING COMPANY.

NOTICE IS HEREBY GIVEN, that a DIVIDEND on the Capital of the Company, at the rate of 6 per cent. for the half-year ending 31st December, 1871, with a BONUS of 3½ per cent., will be PAID to the Proprietors, either at the Head Office, 21, Lombard-street, or at any of the Company's Branch Banks, on or after MONDAY, the 12th instant.

By order of the Board,
W. MCKEAN, General Manager.
21, Lombard-street, Feb. 2nd, 1872.

**CARRIAGE
FREE.**

**SUTTONS' GRASS SEEDS
FOR ALL SOILS.**

SPECIAL CONTRACTS MADE FOR LARGE QUANTITIES.

SUTTONS' PERMANENT PASTURE GRASS SEED MIXTURES,

Prepared for various Descriptions of Soils. PRICE 22s. to 32s. PER ACRE.
For further particulars of SUTTONS' GRASS SEEDS FOR ALL SOILS, see SUTTONS' FARMERS' YEAR BOOK for 1872, gratis and post-free.

SUTTONS' PRIZE FARM SEEDS, CARRIAGE FREE.

Suttons' Mammoth

The most profitable and most nutritious Long Mangel! ever introduced.

Price 1s. 3d. per pound. Much cheaper by the cwt.

SUTTONS' IMPROVED MAMMOTH LONG RED MANGEL.
FIRST, PRIZES AND SILVER CUPS have been Awarded to this Mangel at the following Agricultural Meetings:—

Bandon (Ireland), Barton, Bedale, Birmingham (for the fourth time), Bury St. Edmunds, Cheltenham, Chichester, Cuckfield, Dublin, Dunmow, East Street, Everacote, Faversham, Jersey (on the third time), Kewall, King's Lynn, Lanesdale, Leeds, Leicester, Long Sutton, Newmarket, Northampton, Norwich, Ongar, Pocklington, Reigate, Roscommon (Ireland), Royal Central Bucks, Rutby, Stamford, Stalham, Torrington, Tring, Tumberidge Wells, York (for the second time).

We offer three valuable Prizes for the best 12 Roots of this Mangel to be exhibited at the Royal Berks Root Show next November, and it is included in the Collection for which we offer a Silver Cup at the Birmingham Cattle Show, 1872. PRICE 1s. 3d. per lb.; much cheaper by the cwt.

Long Red Mangel.

The heaviest cropping Long Mangel in cultivation; 70 tons per acre having been grown in 1871.

Price 1s. 3d. per pound. Much cheaper by the cwt.

SUTTONS' IMPROVED MAMMOTH LONG RED MANGEL.

This variety was introduced by us five years since, and is quite distinct from, and far superior to any other Long Mangel. It has, for four years in succession (1865, 1869, 1870, and 1871), been awarded the First Prizes at the Birmingham Great Root Show. The specimens on our Stand at the late Smithfield Club Show, weighing 85lbs. each, were truly described as "Mammoth"; and yet the feeding quality was excellent. It is not only in size of individual roots, but in weight per acre that this Mangel has proved itself superior to all others. Our customers, Lord Northwick and Mr. Thos. Goulstoner, grew in 1870 64 tons per acre; and in 1871 our customer, Wm. Saylor, Esq., grew 70 tons per acre. As a feeding Mangel it is unequalled. The roots are particularly sound and solid, and having generally only one tap-root, it is most easily drawn. We have had this Mangel analysed by Professor Voelcker, who finds it to contain a larger proportion of saccharine matter than any other variety.

PRICE 1s. 3d. per lb.; much cheaper by the cwt.

The best Globe Mangel,

SUTTONS' BERKSHIRE PRIZE.

Price 1s. 3d. per pound; cheaper by the cwt.

The best Mangel for Shallow Soils,

SUTTONS' YELLOW INTERMEDIATE.

Price 1s. per pound; much cheaper by the cwt.

Prime New Yellow Globe and Long Red Mangel Seed, 8d. per lb.

For further particulars of CHOICE FARM SEEDS, see SUTTONS' FARMERS' YEAR BOOK,

Gratis and Post-free.

MARK LANE EXPRESS,
AND
AGRICULTURAL JOURNAL,

IS THE
LARGEST AND THE LEADING FARMER'S AND GRAZIER'S NEWSPAPER,
PUBLISHED EVERY MONDAY EVENING, IN TIME FOR POST.

Office of Publication and for Advertisements, 265, Strand, London. May be had of all Booksellers and
Newsmen throughout the Kingdom, price Sevenpence, or £1 10s. 4d. per annum.

Berkshires
The above are the two dogs of Mr. John's English Sheepdog, purchased and bred in 1871
in one of the houses of the same breed, in 1871

On Monday, Nov. 11.
1851.

THE FARMER'S MAGAZINE.

MARCH, 1872.

PLATE I.

BERKSHIRE PIGS.

THE PROPERTY OF MR. JOHN BIGGS, OF CUBLINGTON, LEIGHTON BUZZARD.

This pen of pigs, bred by Mr. Biggs from his own sort, were farrowed on September 2nd, 1870.

At the Royal and Central Bucks show at Aylesbury in September, 1871, they took the first prize as the best pen of fat pigs.

At the Birmingham and Midland Counties show in November, they took the first prize in their class, and the cup as the best pigs of the section.

At Smithfield Club show in December, they took the first prize in their class and the silver cup, as the best pen of pigs in any of the classes.

We had not much opportunity of looking over this famous pen at Aylesbury, but on seeing them again at Birmingham we wrote thus: "Far away the best pigs were Mr. John Biggs' Berkshires, which might have taken any extra premium as the best of all, instead of merely the best of two classes." And, again, at the Smithfield show we said: "The silver cup for the best

pen of pigs in the Hall has now gone for four shows in succession to blacks. The judges had, indeed, a very poor opinion of the whites generally; and though they threw in a commendation here and there, or more properly but *two* commendations in *three* classes, they generally commended the three classes of 'other breeds,' or, in point of fact, Berkshires, where the three first prizes were taken by Mr. Biggs, who had already shown the strength of his hand at Birmingham; but the competition here was stronger, as evinced by the displacement of Lord Ailesbury's and Mr. Bailey's good pigs. It was, in fact, all through a capital show of Berkshires, led off by some of the most useful farmer's pigs ever exhibited."

These pigs were fed on barley and Rivett's wheat-meal, skim-milk, and Thorley's food. Their live weight was 17 cwt. 3 qr. 10lb. They were purchased by Mr. Brown, of Warwick Street, Leamington.

PLATE II.

ON MONDAY NEXT.

Who is there with soul so dead that does not give a glance, and follow it up by another and another, as he views the gallant veterans of the chase, struggling on the London flags, craning in all directions, as they wend their way to be bound to a new master, by the "Tat of the hammer," on Monday next? A sight of them must bring back to most of us some fond remembrance or sweet recollection of a distant country, brother-sportsmen, favourite meet, or clipping thing, and make the heart of many a once jolly country lad, but now a pent-up, lan-

guid, London-bound apprentice, beat again, as he catches a glimpse of the slashing-looking VILLAGER and his jovial comrades jogging through some murky back street. Aye, they make the poor heart of many a caged bird beat again for rural scenes, sports, and pastimes, the old house at home, and healthy, honest-looking faces. Or, if not they sigh again, as the kind cheery tones of old Will reach the ear, with "Cheer up, my lad, cheer up"—or "Coom, lassie, coom"—I would I were a foxhound!

THE FARMERS' CLUB.

FARM MANAGEMENT.

The first monthly discussion meeting of the Club for the present year, took place on Monday, February 5, at the Club-house, Salisbury Hotel, the Chairman for the year, Mr. H. Cheffins, presiding. The subject fixed for discussion was introduced by the Rev. G. Davies, Hall Place, Romsey, being "The Use of Method, Arrangement, and Observation in the Management of a Farm."

The CHAIRMAN said: Gentlemen, this is the first occasion on which I have appeared before you as your chairman, and I shall adhere to the promise which I have made more than once, that I would not inflict upon you a long speech. As this happens, however, to be our first meeting this year, permit me to offer my congratulations on seeing before me so many old friends of the Club in health and happiness, and to add that I am very glad to see that there have been so many new members during the past year (cheers.) I will not take up your time by entering into the subject before us, but I am quite sure from what I have heard of Mr. Davies, and from some knowledge of him as a resident in my own county, that we shall hear something that will interest us very much (Hear, hear).

The Rev. G. DAVIES read the opening address: This subject is of a homely nature, and, to a certain extent, lacks the dignity of the discussions to which the Central Farmers' Club may consider itself entitled. I trust, however, that whatever is practical may be by you excused, even if of a plain and homely aspect; and that an audience (which comprises many who know far more than I do of agriculture) will excuse remarks derived from daily life on a farm. We live, indeed, in an age in which "men run to and fro, and knowledge is increased." Men naturally therefore select subjects for discussion bearing on the advancing science of the age. The pioneers of progress are constantly at our elbow, and the tendency of discussion is towards progress—it is a go-ahead age. But retrospective glances are good. May we not be omitting some things which our more slow-going ancestors valued and worked out for us? Amidst the rattle of steam-engines and the odour of phosphates, may we not be omitting some of the simpler appliances which are also necessary component parts of a farming system? We certainly have progressed most wonderfully in all matters connected with the cultivation of land, and nowhere more than in Hampshire, because the discovery of dissolving bones, combined with the introduction in the last fifty years of turnips and swedes, has enabled us to cultivate hill-farms, which before were worthless (except as sheep-walks), because they were inaccessible to the dung-cart. At the same time, are there not some things in which we have gone back? I often hear the complaint on heavy lands, "Our clays cap so—run together after heavy rains—even more than they used to do." What, wonder? We shave our wheat-straw, and, indeed, all our straw crops off so close to the ground with the reaping machines, that in distant fields perhaps no vegetable matter is ever returned to the ground. But in olden times, when they reaped high, and then began winter-fallowing, there was after every straw crop about six inches of straw distributed, and not

only distributed, but placed in a most even way, so that it was restored to the ground, and not only that, but the under-side of the turned-over furrow was by this means wedged up as it were to let the frost and air circulate underneath. If you consider this going on for a long series of crops, can you wonder that the land changes character? I admit our forefathers' stubbles were foul, and that we have learned the value of straw for stock and also for feeding stuffs. Still, that does not alter the fact. Let a man cart out for his sheep to lay on of a wet night ever so little refuse straw, and see the difference in the work of that part of the field compared with the rest of the field. Take again the instance of chalking land. You will excuse my illustrative being in a great measure local; I am speaking of heavy land in the south of Hampshire, which is strong, good, wheat land, about thirty to thirty-six inches from the chalk. Now, in walking over that part of the country, you will see in every field one or more chalk-pits. I have in a forty-acre field a pit from which an acre of chalk has been dug, and put on the land—mind, a chalk-pit the area of which is an acre, and the depth thirty or forty feet. That field must have been in times gone by chalked over and over again, because three or four rods of area at that depth would chalk it all over once. And I conclude none was taken into other fields, because all the surrounding fields have their chalk-pits, and people would naturally cart from the nearest pit. I observe these chalk-pits have not been much used of late years, because in all my pits I find gun-flints and the stones chipped off them at the mouth of the pits. At the time of the Peninsular War the flints of these chalk-pits were largely used for gun-flints. It has been said to me more than once by strangers looking into these pits, "Why, what absurd people you Hampshire folk must have been; it surely never could have been intended that chalk should be put upon this soil because Providence has placed it so close; why, it is only three feet from the surface." On the same principle one might say in the Midland Counties the coal could never have been meant to smelt the iron ore, because it is so near. The test would naturally be this: take a piece of land just broken up out of a wood, which has never been chalked, although it has a chalk subsoil; try it without and with chalk, and you will soon find the wisdom of our forefathers. I will quite admit the immense progress of the age—steam-engines and the solution of phosphates were not problems for the infancy of farming; but yet our forefathers worked well with the materials they had at hand. Our returns are enormously more than our ancestors' on the same farms fifty years ago; but then our expenses are enormously more also. When they had no roots, because roots were not known, the labour bill was small. There was no necessity to employ labourers, because there were only cottages for the carter, the shepherd, and the thrasher, and these three functionaries did the work of the farm; and so it used to be a local proverb that a man wanted an active carter to get over the fallows, a lazy shepherd to make the sheep-feed last out, and a spiteful thrasher not to leave any corn in the straw. The labour accounts such as we have—equal to the rent, tithe, and taxes on a farm—

they knew nothing of, nor had they, I imagine, the enormous bills we have from blacksmith, wheelwright, harness-maker engineers, &c. Thus, to make a fair estimate of an improved position, we must look at both sides of the balance-sheet—expenditure and returns. I have been led into these remarks by two stories respecting past and present, which I shall venture to put before you. They both relate to fifty years ago. In the year 1870 I was talking to a labourer who had lived in the village all his life, and was seventy-six years old. We were in a wheat field, at harvest-time. I said, "I suppose you don't recollect so long ago, though you are old enough, what sort of corn crop this farm carried fifty years ago?" He replied, "This very field was wheat fifty years ago, and I mind it particularly because I was going to be married that autumn, and I worked early and late to earn money to furnish my home with." "Well," I said, "and compared with the present crop, what sort of a piece of wheat was there?" He said, "Rather more straw, and quite as much corn, as there is now." Now, my crop in which we were standing was a good crop—after swedes grown with superphosphate, and fed off by sheep, eating a little corn and cake. Supposing the sheep to pay for the artificial food, there would be still the expense of the root crop, say £4 an acre. "How was the crop grown fifty years ago?" I said. "It was a fallow, well knocked about for nine or ten months, and then a ewe flock, running sainfoin and clover leys, folded at night on the naked fallow." There is a picture of the same field under the same crop in the autumn of 1820 and the autumn of 1870. The old style was much less expensive, and the result as good. The question, then, arises, Are we better than our ancestors? The other anecdote is of a very different kind. A gentleman, who farmed some hundreds of acres of land, close to the town of Stockbridge, retired last autumn from farming, and, at his sale, he said, "I commenced this flock of Hampshire Down sheep, which will now be offered under the hammer, on this same estate in the year 1821; but half a century has altered prices very much. We must make great allowances for the exceptionally high prices of this particular season, but, after making this allowance, what a fearful difference! In 1821 I purchased the ewes from which this flock is descended for 12s. each, and the lambs at 8s. each. The ewes are now worth 48s. to 50s., and the lambs 40s. to 44s." Here is a wonderful picture—corn farming not much progressed; stock, quadrupled in value within half a century—or, to take off one-fourth for the exceptional year, three times the old value. I was telling this to a very experienced man, Mr. Westbury, of Andover, a well-known valuer, and asked him if my figures were correct. He said, "I myself am old enough to recollect something of the same sort. A man once offered me some couples (ewes and lambs), quite sound and healthy, at 7s. 6d.; 'But,' he said, 'it is 2s. 6d. a-head more than they are worth in the fair, and therefore, as a friend, I should not like to sell them to you.'" Of course, these figures apply, in matters of profit, to the breeder only—not to a man who buys a lean sheep and fats him, because this year the profit is to the breeder, and the fatter may even have to sell at a loss; certainly, if he bought in late, his profit will not be great.

METHOD.—With respect to the method which a man will pursue in farming, he will probably, to a certain extent, be bound down by his lease; and his lease, to a certain extent, may be a safe guide, because it is generally drawn from experience of the tillage most suitable to that particular locality. Still, I think, after a time, landlords will grow less stringent

in their leases, and, in fact, now the covenants are seldom kept strictly, except in the last two years. If a man is bound down not to sell hay, straw, or roots off a farm, he cannot hurt it much; if he is bound to keep so much stock per acre, he cannot much hurt a farm. Sometimes there are covenants in a lease which are very *injurious* to the tenant, without helping the landlord. In some leases in my neighbourhood the covenant is inserted never to have two white straw crops in succession. That is now changed for this greatly improved clause, "Not to grow two white straw crops in succession, unless after two root crops just preceding." Ours is a heavy wheat country. If wheat is followed by a root crop, fed off with sheep, and barley put in afterwards, the barley goes to straw, and exhausts the ground, without producing a good sample; whereas, barley sown on a wheat-stubble is often much more productive, and always of a better quality. Then, with a breeding flock, we are obliged to keep back our roots till March, April, and the first ten days of May, in order to support our lambs till the grass is ready. This land, so fed off, is often, if put in with corn, in bad tilth, and too late to expect any yield; whereas, by ploughing up the late-fed swedes, and putting in rape, or mustard, or vetches, or some other catch crop, for sheep to be fed off in the autumn, the cultivation suits the seasons, and then it comes well, twice folded, for wheat in October and November, and that wheat followed by barley or oats. This greater latitude in the leases is now being introduced, in deference to common sense. As a general rule, I think a man coming to a new county cannot do better than follow the system of that county, at all events, at first, let him look over the hedge and see what his neighbours are doing, and try to improve upon that; but, still, let him take the farming of the district as his basis. Look how different is the cultivation of Hampshire chalks to heavy land in Essex, for instance. In Essex, all your tackle made to fit a ten-turn ridge, so that your horses may always walk in the furrow; in Hampshire, no furrows, and the more your horses tread the ground the better; in fact, for wheat, we often drive flocks of sheep over the newly-sown corn to get the ground firm, and follow the plough with a presser. It is a bad compliment to any locality for a new man coming from another county to imagine the people who have lived there all their lives know nothing about farming; yet many a new-comer proclaims this when he sets at naught all the old views of tillage, implements, and cattle. I did this to a certain extent myself, and, therefore, I see the folly of it. I thought I could introduce long-woolled sheep, instead of the Hampshire Down; but I soon found the improved Hampshire Down was the sheep of the district and the sheep for the district. They work hard for their food, and fold well, and from an even distribution of lean in a fat sheep, are always saleable. In fact, the camel is not more peculiarly fitted to be the ship of the desert, than the Hampshire Down sheep for its own locality. I believe that it is a great mistake to take it into a grass country, as it is peculiarly liable to foot-rot, far more so than the long-woolled, whitefaced sheep. The same with the horses—one wonders at the Shire bred horse with so much hair about his legs. But to a horse walking all day in harsh clays and beds of sharp flints, that hair (though it looks ugly) is as useful as a beard to a colonial bishop subject to bronchitis. Then, again, in implements; the light swing-plough of Suffolk is a very pretty instrument compared to the two-wheel Hampshire plough with its shifting head gear for the beam to slip aside when the plough comes in con-

tact with an imbedded flint. However, our heavy land plough, with the shifting head gear, which we call "the gallows," was, I daresay, not invented in a day, or without great forethought, and certainly it admirably answers its purpose. In the same way I tried hoeing wheat on the strong land, but the hoe flies off the stone, and cuts out the wheat quite as much as it would cut the weeds. Again, look at the Hampshire way of making the sainfoin ricks in the fields close to the roots, and then cutting out the hay and feeding the sheep in cages made of the common ash-poles of the hedgerows. It seems to a stranger a very antiquated and wasteful way. But it is not, because if you have lambs folding first, and the ewes following, they eat up everything clean, and don't waste even a leaf of the hay. The stock ewe kept hungry to follow the fattening sheep is the best clearer up I ever saw. I knew a farmer who came from a distant county, who with new-born zeal set to work to carry all his hay home, cut it into chaff, bagged it up, brought it back, and gave it to the sheep in troughs. They did not eat it any cleaner, because they wasted none before. Look at the expense. To carry the hay to the homestead, pair of horses to cut it into chaff, then bags to be filled, and carting back to fields. Reckoning horses, troughs, bags, and men, I suppose I should not be wrong to say this involved a loss of 20 per cent. However, that person believes in local customs more than he used, and he has got the ash-cages back again, and one man and a boy manage 300 sheep very well on the old plan. He does not think now that the county he came from has a monopoly of wisdom. Whether I am right in my estimate of 20 per cent. on the value of the hay, being the difference or the proximate difference on the two systems, at all events the difference in expense is enormous. Quite enough, at all events, to make a difference of profit or loss on the whole sheep on a farm. And, after all, it is on things of this sort that the question hinges. Take the case of three men—a man who is extravagant in labour, a man who is liberal but judicious in his labour without being wasteful, and a man who is so mean in his labour that things are not done which should be. But the virtue lies in the mean between the two extremes—between extravagance and penuriousness. In the same way, if two men, one who buys and sells well, whether by himself or by commission, and one who sells badly, will lay all the difference of profit or loss. One man may save money, while the other will gradually be exhausting his capital. Even in the date of the leading fairs of a county a man may observe some things to guide him. Our chief early fairs are Stockbridge and Overton, large lamb fairs. They come in the second and third weeks in July, and I have noticed that within two or three days of that time, our trifoliums, sainfoins, and last vetches are done, and as we have no meadows what is to be done with the lambs?—sell or starve. The date of those fairs are guiding points to a man, they are his light-houses, he must steer by them. His down may keep his ewes going; but his lambs, if he is a large breeder, he must sell, because until his clovers afford another bite, or his giant sainfoin, he will be sorely pressed until his early autumn turnips and rape come in, which will not be until September. So much for the customs of a locality.

ARRANGEMENT.—Now, when I say a few words on arrangement in matters of detail, I speak again (I am aware) of those minutiae, which, though seemingly beneath the dignity of essayists, may contribute a great deal to the successful and pleasant working of a farm. On a large farm the study of arrangement is most necessary, in fact, this is as the oil

to the machine, which without it runs to wear and waste. Take for instance, the case of a man starting over-night to set out the work of a farm for the morrow, several teams of horses to be got out, and a large number of men, with the probable contingency that a heavy fall of rain in the night or a hard frost may make it necessary that every order must be supplemented with another to provide for emergencies. A man setting to work to do this without a business head or a knowledge of arrangement, will find himself very much in the position of a civilian who should be suddenly called on to march 20,000 troops in or out of Hyde Park. You may reply, "True; but then a large farmer would always have a bailiff to do this." I admit it, but then, if a man understood his business, he would never ask a foreman to do what, if he were put in the position, he could not do himself. How should he know that his foreman is doing it day by day to the best advantage, if he could not do it himself? Besides, a bailiff soon becomes your master if he finds you cannot do without him, or that you could not do if he left you what you expect him to do. I believe very much in the "power of titles" in agriculture as well as in other things, and that the education of the farmer cannot be too practical, cannot too much embrace the early stages of learning, the lower departments of knowledge, what will correspond to the catechism and primers of literary education. Let me illustrate by a very small matter. It was with us a very wet and catchy time at harvest, one man seeing his men stopped from cutting corn by a shower, set all hands to work to throw off the dry straw to catch the descending moisture, afterwards to draw the straw ready for thatching. The next day sets in hot, and a wheat rick was made in the afternoon, and next day thatched and safe. Another man tells his men to stand still; that makes them dissatisfied at losing half-a-day. When after a while he throws out his straw for thatching water has to be fetched in a water-cart some distance from a pond. When his wheat ricks are finished a delay occurs in the thatching, no straw being drawn. Here are three points lost at a very important time, and a wet wheat rick as a final result, all from what might by good management have been avoided. Take another case: one man has his turnip and swede crop in half-a-dozen different fields; another man has managed to throw his four or five course shift pretty much together. Look at the difference in the moving tackle from field to field, and after that in shifting hurdles, cages, &c., when the sheep are folding off the roots. I pass on to the third and last head to be considered, viz.:

OBSERVATION.—The observant man I take it to be one who thoroughly enjoys his farm, as the gardener enjoys his vinery or his greenhouse—one who spends his time on it, watching it and the plants that grow on it at all times of the day and in all seasons. He who loves his profession is the only man likely to get on in that profession—and thus the lover of agriculture watches it with an intense scrutiny in all its varied and delicious changes of season—ever looking forward to its successes with fondest hope, and even by its accidents and difficulties being braced to greater action; for difficulties are bugbears to fools but the instructors of wise men; and it is because so many difficulties have to be encountered in bringing farming operations to a successful issue that farming has in it so great a charm, and is so great a dispeller of listlessness and ennui. We all know (and some of us in this room have heard) those admirable statistics which Mr. John Bennett Lawes has drawn from the experimental observations in various plots of ground, stimulated and fed with different ma-

nures. Now, what he has so well done for the public, is what each man ought, however unconsciously, to be working out evermore for himself. And that he can do without expense; only let him, as he walks about, keep his eyes open and his mind at work. How much will accidents do to inform him? It was but last summer that I noticed a square piece in the middle of a wheat field, where the corn was a few inches shorter than the rest of the field. As the piece was about the size of a sheep fold, and the line of demarcation ran as regularly as the hurdles would, I went to the shepherd, and said, "I see such a piece looks as if the sheep had broken out from their fold when the mustard was panned for wheat last autumn." He said, "Yes, one night I suppose a strange dog must have run by the fold—for they did break out of that particular fold, and laid under a hedge in another field—and it could not have been long after I left them in the fold at sunset, for in the morning I found they had scarcely eaten up their bait." We know the value of bringing a ewe flock in full off clover leys and folding them thick between hurdles, as well as any one; but it was never brought home to me so clearly as by that accident. Those sheep had been one hour in that fold, and twelve hours on the next; and it was to be seen, by difference in straw and corn, exactly (as in Mr. Lawes' plots) what was the value of a sheep fold for corn; whereas, otherwise it would have been only known in a general way. If I had had a farming pupil with me, I think that would have taught him more than volumes on the same subject. Again, suppose one of our stock farmers to divide his lambs and fold them in the same field; the ewe lambs, being for stock, we do not want to feed, the wether lambs we do. I did this three years ago, and penned them over roots side by side. The ewe lambs had only hay. The wethers, with only a hurdle between, went down the same field in parallel lines, and I allowed them about four sacks per acre of oats in addition to the hay. I put that field in with oats in the spring; and, as near as I could reckon, there were four sacks an acre more on the part where the wether lambs were fed; so that I exactly got back my four sacks given in feed. If I had fed the whole field with sheep eating oats, I should not have been able to say whether the corn given had improved the crop or not. It was the accident which helped me. But the same thing holds good whenever there is only a partial distribution of manure. Supposing a farmer to be trying any top-dressing, it is always well to try some on a crop of which a ridge here and there is left unmanured; otherwise what is attributed to the manure may perhaps be due to the season or the tilth with which the crop was put in. It is our custom to drill all our root crops, swedes, turnips, and mangolds, with ashes and superphosphate. My custom, as my land is heavy, is to drill never less than 100 bushels of sifted ashes and 3 cwt. of dissolved bones. I find by getting the dissolved bone either from Mr. Lawes or Messrs. H. & T. Proctor, I am never disappointed in a crop. The expense of the bone and ashes is about 30s. an acre. It very often happens, owing to the ashes being damp, that the manure drills get stopped for a few yards while the seed barrel delivers the seed. The turnips or swedes get hoed in these patches, where the manure has not run the same as the rest of the field. In the autumn the exact value of the manure is easily estimated by taking a dozen roots from the manured and the unmanured drills, and estimating their weight. I am inclined to think the crops would stand on an average, as 15 tons per acre on the manured drills and 5 tons on the unmanured. The average weight of roots with manure would be as 6 lbs.

to 2 lbs., the bone and ashes making a seed-bed and giving the plant a great start in the early season of its growth. I may add, I prefer old ashes which have been exposed to a winter's wet and cold, because they are damp, which new ashes are not; and in our dry soils the damp of the seed-bed often brings up a plant, which with dry ashes would not start till a rain. If this calculation, which is open to your criticism, be correct, as I believe it is, the cost of the extra ten tons per acre is to be achieved at the rate of three shillings a ton. This fact would be a good motto to Mr. Lawes or Messrs. H. & T. Proctor in their annual circular; and if they send me an extra ton of manure with what I shall order of them this year, I will not put, as authors do now-a-days, "All rights in this publication reserved." Youth does not admit of the time to have accumulated knowledge by its own industry; but youth, by being distrustful of itself and humble, can glean an immense amount of information from others. Suppose a man to have a shepherd who has tended sheep on your farm for twenty or thirty years, how much may be learned from him, or from your carter or drillman's experience and observation in times past? "To pick the brains and inherit the experience of such as these is the practical way to learn of the past and to inquire of the days that are gone." Thus it is that accident often tries experiments for us, which we have not the energy to set about for ourselves. But if we observe them when they do occur, what matter? I have another one in my mind at this time. There is half-an-acre of ground in the corner of one of my fields which was let as an allotment-garden with some cottages for several years, and cultivated with spade husbandry. It has been now cropped for six years in the usual course of husbandry with the rest of the field under the plough. But I can see the boundary line to an inch—in every crop now after six years—which I suppose we should attribute partly to deep cultivation of the spade—partly to the manure—but chiefly to its having had entire rest for many years from cereal crop. If land gets (as the saying is) clover-sick by sowing clover oftener than once in eight years, does not land get wheat-sick and barley-sick which has had a white straw crop, on a low estimate, thirty times in fifty years. This allotment system of the labourer enables me here to quote an observation which occurs in the 6th page of Mr. Mechi's well-known Farm Manual. He there says: "The cottage garden, independently of its deeper cultivation, receives in manure thirty-two times the quantity that the farmer puts on his land. As is the meat made so is the manure. Now the labourer with his pig consumes perhaps three sacks of barley, which, at 7lbs. of meal to 1lb. of pork, makes 84lbs. of meat. That you will find is four score on one-eighth of an acre (the size of an allotment), or at the rate of thirty-two score of meat to the acre. The average of farmers do not make one score of meat to the acre." Mr. Mechi then quotes an instance from the 11th volume of the Royal Agricultural Societies' Journal, of a farmer who produced four-and-a-half score per acre. By consuming the whole of my barley crop this autumn I find I shall produce one-and-a-half score per acre of fat pork, and I suppose I might say about an equal quantity of mutton and beef. I should very much like to elicit the opinion of the meeting as to the quantity of meat which on an average farm could be produced profitably. As to warm food on animals, I think the labourer's pig gives the result of a continual experiment on a small scale. My labourers generally have the doll or cad pig out of the trip and keep it. I invariably find that this much-despised and injured offspring

of the sow in a labourer's hauds always walks in a winner over the whole trip of its brothers and sisters. I often say to the purchaser of such a small specimen afterwards: "Well, is the pig come to an untimely end?" and I invariably get the reply, "Gone far ahead of all the rest of the trip; just look over and see when next you pass." And whenever I have looked I have found it so. The secret is that the thrifty housewife always keeps the pot on, and the pig thrives accordingly. The moral of which would be—Why don't you boil everything for your pigs? That is a very difficult question to answer—it is a mere question of labour, and perhaps what can be done on a small scale profitably cannot be done on a large. Unless it was done regularly it would do no good. I often notice at the model farms I visit steaming apparatus put up, but not used. I suppose it is difficult to afford the spare man on a farm to do it. One can see the results ten years afterwards of where a dung heap has stood; but I never could get anyone to tell me why it is that where a hay rick or straw rick has stood the crop shows the place years afterwards. Admitted that small particles of vegetable matter may fall through; but even where there has been a bottom of faggots, and everything has been cleared up, still the effect is evident. And it almost seems as if the exclusion of air and light had the contrary effect to that which we usually attribute to it. Out of this close observation arises a sort of mental arithmetic, by which conclusions may be quickly formed. And nothing is more valuable—some such habit as this in the management of a farm. The mind of the experienced man in this way is like the table of a ready reckoner. I daresay it has struck many of us how frequently the man who has grown wealthy as a dealer or a farmer is found to be one who cannot write his name to a cheque. While many a scientific man by his side has grown poor. It seems a paradox which refutes the common saying that "Knowledge is power." But this is not so. The fact being that the uneducated man has knowledge but not book learning, and while the student has devoted a great portion of his time to polite learning, the uneducated man has sent the whole energy of his being, and the force of his observation into one single channel. After all "life is a system of compensation." We are more evenly gifted than we think for, and the man who cannot sign his cheque for a flock of sheep, may often have earned enough to write a good many. Is it not the case, that if a man lose one sense, another becomes quickened? No one knows a carriage is behind wanting to pass better than a deaf coachman, because his sight and his sense of feeling tell him by his own horses that there is a noise behind, though he is deaf. That a great many people can grow good kohlrabi that would not know how to spell the word, the following anecdote will tell: Two farmers were talking about it, and one was explaining to the other its valuable properties, how it should be grown, and so on. At last the other pulled out his pocket-book, to write down the word, with a view to ordering some seed, and said to the former speaker, "Well, how do you spell the word?" Spell it? why, the same as other words to be sure; how would you have it spelt. Now, I won't tell you any more, you want to know too much." When I say "mental arithmetic," or the power of reckoning the cost and expense of anything, I mean something like what the sheep-dealer does when he reckons by scores: as a score of sheep at 35s. 6d. each, will be £35 10s., and so on. If a man could tell without hesitation what he could take in 100 lambs for, to find hay and

roots; what to take them in with half-a-pint of oats a day, or half-a-pound of cotton-cake; or, what he could take in 100 ewes with hay per week, he would then be able to say in a moment what per month, what to winter them. And suppose he could take in a lamb for 8s. per head, or a ewe for 12s., to winter, he would be able to see at once, whether, in such a year as this, with turnips to be ploughed in or given away, it would pay him to buy or to keep sheep for other people. The other day a person said to me, "I have got a chance to supply a stable with straw. Had I better exchange the straw for the manure made by that straw, even; or had I better sell the straw at £3 per ton, and buy back the manure at 14s. a waggon load?" I don't suppose there is much difference, it will come to much the same thing. I said, you had better weigh out a ton of straw, use it in your own stable, and then load the proceeds, as rotten manure, into a waggon, and you will see there is a very great difference. I believe considerably more than half, which would be £1 10s., out of £3. I believe more than that even, and that £3 worth of straw at present price, would come back in about a waggon and a cart, as well-rotted compost. I have tried it, and I have had the experience of others who have tried it, and I believe those whom I have asked, put it at a greater difference than I do. In the same way one may think to keep mangold or carrots till the spring, and get three or four shillings a ton more for them, and the inexperienced man may fancy he has done. But take the expense of clamping, the risk of decay, and chiefly the loss in weight, we should admit the earliest sale made on the ground in the autumn, even if it was twenty-five per cent. less, would be the most profitable. It is time now in a few more lines to bring this paper to a conclusion. What I have offered has been written for plain practical men, and, as I said in the beginning, falls rather below the dignity of a club like this, which contains many men of high position and great knowledge. In fact, this club is, to a certain extent, a sort of agricultural House of Commons, and would come within the meaning of Tennyson's expression in "Locksley Hall,"

'In the parliament of man—the federation of the world.'

But these debates are real far beyond the members of this club; they are printed in the farming papers, and our ideas are picked to pieces over a many a fireside. I presume, therefore, I shall be forgiven for having taken my ideal of a farmer—not from the aristocracy of agriculture, but from the farmer as he exists as a class, including every one from the man just above the labourer, through a long ascending scale up to the manipulator of a large acreage. I have been rather "calling simples" than offering any scientific researches; and my remarks are as if one was to place a herbal by the side of some learned professor's treatise. Thoughts like these form starting points for other thoughts, and as men pause and become thoughtful so they become wise and practical. I have said do not despise what our forefathers practised merely because it is old. We should be surprised if we looked back more—but who, alas! looks back in this go-a-head age? It is like the motto over the spill in the Melton Mowbray brook, "Pace too good to inquire." If we looked back we should be surprised to find how old many of our good ideas are. Take the old school-book the Georgies of Virgil: there we find the long fallow described as the only thing that bursts the barn doors; we find the pulse crop spoken of as (next to fallow) the best change for land tired of white straw crops there is the caution to put

vitriol to your wheat, and if Mr. Hallett wants a Latin motto for his Pedigree wheat he will find it well in the first Georgic; and Virgil, quoting from still older writers, Varro and Columella, speaking of the selection of large kernels, says that selected seeds degenerate except by continued selection:

Vidi lecta diu, et multo spectata labore,
Degenerare tamen; ni vis humana quotannis
Maxima quæque manu legeret: sic omnia fatis
In pejus ruere, ac retro sublapsa referri.

Which would be a very practical motto, saying, "Not only buy Pedigree corn, but buy it every year, as it goes back." I will not touch upon the education of a farmer, because that is a subject which we shall no doubt have some day in a separate paper by some competent person; but this only will I say that I have endeavoured to show that no education of colleges or of books, excellent as they are, can supersede continual habits of observation, method, and arrangement. And herein exists the answer to the often-asked question, How is it gentlemen farmers don't make money? Because they never began to learn at the bottom of the question. They are in the hands of other people; and how large a margin exists between the balance of a man who buys and sells well and one who does not! The book-educated man would not have picked out the cow offered at dairy price in Devizes market, and yet I should like to have for a fortune the money that one animal produced when Mr. Stratton's observed eye fixed upon her, as the basis of a long line of illustrious Short-horns. A practical man can tell more about how sheep are doing, by looking into the wool over a hurdle, than an unpractical man would by handling every sheep. We have had, gentlemen, an unexampled year, in which we have been nearly ruined by the excessive prodigality of nature in one root crop. I never could understand an old Greek proverb till this year. The proverb is—"The half is greater than the whole"; but this year half the crop of roots would have enabled us to buy sheep to fat, the whole crop has raised lean stock to such an exorbitant price that the roots are of little value. As I have had to read the first paper at a short notice, I am sure you will accept the errors of a somewhat hastily prepared composition, and in your after observations, put me right where I have erred in the estimates of calculations which I have made. I should be glad if some gentleman present would tell me how it is, that when rents, labour, tithes, and taxes were so much the same as they used to be (Cries of "No, no")—well, supposing such things to be the same as they were formerly, farmers were not doing as well as they did?

Mr. T. HORLEY (The Fosse, Leamington) said: Mr. Davies having told them that the cost of wages was much the same as it used to be, he should be glad if he would tell them what it was in his own district?

Mr. DAVIES said, what he meant was, that the wages of individuals were very much the same. Of course, if 20 labourers were employed now were five were employed formerly, the total was proportionately large.

Mr. HORLEY: What wages do you pay?

Mr. DAVIES: 13s. a week. You cannot get a man for less (laughter).

The Rev. E. SMYTHIES (Hathern Rectory, Loughborough) said that as in these days almost everything was in a progressive state, perhaps it might be well if some one suggested there had been a little improvement in farming (Hear, hear). He must confess that when he first saw the title of the paper he was a little puzzled to know what would be the precise

nature of the subject. Perhaps it would have been well if under the head method, arrangement, or observation, in reference to farming, Mr. Davies had said something about farm buildings. That was a very important question in his opinion, in relation to good husbandry. Every one who had any practical acquaintance with agriculture must be aware that there were two sorts of farm buildings erected, each, perhaps, costing £2,000, one adapted to a farm of 500 acres, and the other to a farm of 150 acres, and that there was exhibited a total want of method and arrangement. They all knew that the ordinary style of farm buildings was a haphazard style, so that if the buildings had fallen down from the clouds it would scarcely be less adapted to the requirements of the farmer. Some years ago, having to erect a set of buildings for himself, he had great difficulty in obtaining the requisite information and knowledge for his guidance; but, by dint of great pains, and as the result partly of information obtained from others, and partly of his own observation, he did succeed in getting what he wanted. He found it very difficult to discover anything like a practical system which included a perfect conservation of manure, and the making of manure in the most concentrated forms at the least possible expense—such an arrangement that the largest quantity of cattle, sheep, and horses, could be left in the buildings in the most economical manner; and he thought that subject was well worthy of the attention of the Club (Hear, hear). The grand point in his opinion was to have the farm buildings managed in such a method that the straw, which is the bulkiest article we use, and which every department of farm buildings require, should only pass in one direction, and never go backward and forward, so to speak, but pass from the stack-yard to the thrashing barn, from the thrashing barn to the cart-horse stables, then to the chaff-cutter, to the place where it is to be mixed with pulped roots, to the sheds and ranges down which it is carried to feed the cattle, from thence to the manure place where it is to be deposited, and then to the land where it is to be ploughed in and finally disposed of (Hear, hear). He should be glad to hear some practical remarks on that important question that evening. He had himself adopted the kind of arrangement that he had described, and his plan included the pumping of liquid manure, so that the straw got thoroughly saturated before it reached the land where it was wanted. Another very important point which had struck him was the position of grass and arable lands in relation to buildings so as to have the maximum of the arable land nearest to the farm-yard and the grass land at a greater distance. There was not, he believed, a practical man in this country but that knew how many farmers were compelled by the bad arrangements of their farm in that respect to have not merely the best land, but even poor grass land, close to the buildings, while the arable land was a long way off. That was a great source of loss, and he did not suppose there was a manufacturer in the kingdom who could hold up his head if his business was carried on in a similar manner. Manufacturers presented in that respect a great contrast to agriculture (Hear, hear). So fine was the rate of profit among manufacturers, owing to the pressure of competition, that he had been assured by people who knew Manchester well that if a mill or warehouse had not a lift to hoist things up to the top of the premises in accordance with the universal practice, the proprietor would be beaten out of the market. So great would be the loss of time of having everything carried upstairs that the fraction of a farthing per lb. extra in the cost of a pound of yarn would

make the difference between profit and loss. If that were true of manufacturers and warehousemen, it was equally true that farmers must suffer seriously, if, owing to the want of proper method and arrangement, the maximum of mutton and beef and pork were not produced by the minimum of labour (Hear, hear). In the midland counties, with which he was best acquainted, he had often seen an awful place in the middle of a farmyard, and a man up to his middle while carrying a heavy load of straw or hay, and perhaps the poor fellow had to climb up a steep place where in frosty weather he ran great risk of losing his legs. That was, he maintained, a gross practical mistake. Manure ought to be made under cover, and the farmyard along which men had to go backwards and forwards should be paved like one of the streets (Hear, hear). What Mr. Davies said about the spelling of kohlrabi reminded him of an anecdote which he once heard. A gentleman at Dublin, having asked a friend to dinner, the party invited wrote, as an excuse, that he was suffering from a severe attack of gout. The next morning the gentleman called upon his friend, and said, he was very sorry that he was suffering from gout—that he knew he used to suffer from rheumatism—but that he did not know that he ever had the other ailment; to which the gentleman replied, “Would you have me waste my time in trying to spell ‘rheumatism’?” (laughter).

Mr. G. H. RAMSAY (Newcastle-on-Tyne) must say that certain things mentioned in the introduction certainly did not apply to his part of the country. Generally speaking farmers there had good farm buildings; they had excellent cattle, including some of the best Shorthorns in the world; and they were not as slow as it might be inferred that farmers were from Mr. Davies' paper. He had often questioned Mr. Mechi about his balance sheet, and he should be glad if Mr. Davies had given them a rough balance sheet showing what was the result of his principles. He said it was hardly to be expected that in these days a clergyman would be able to produce a satisfactory balance sheet; and he must remind the rev. gentleman that the great regulating principle in reference to all such matters as he had referred to was the principle of supply and demand.

Mr. J. TRASK (Northington Down, Alresford) said, as a Hampshire man he could not admit that the rev. gentleman who introduced the subject represented the views of the Hampshire farmers. For example, Mr. Davies, in speaking of chalk, said he had so much of it in his field, that it wasn't necessary to put it on the land; that although that was done in former times it would be too expensive now. He could tell him that it was done by the best farmers in Hampshire at present (Hear, hear), and there would be more money spent in that way if there were a better understanding between landlord and tenant (Hear, hear). With respect to the prices realised at Mr. Attwood's sale, he must remark that last year prices were exceedingly high, and that if the same things had been brought to the hammer in 1868 or 1870 they would not have fetched a great deal more than they would have done fifty years ago. He was surprised to hear the statement that wages in Hampshire were only 10s. a-week. That didn't at all accord with his experience (Hear, hear). Moreover, he knew something about the amount paid by the rev. gentleman's own neighbours, and speaking generally, he had no hesitation in saying that the average amount of wages paid in Hampshire was 15s. or 16s. a-week. He farmed several hundred acres of land, and frequently associated with agriculturists both of North and of South Hants, and he repeated

that Mr. Davies' views did not at all accord with their experience.

Mr. H. NEILD (The Grange, Worsley, Manchester) said, although he agreed with Mr. Davies that they were too apt to underrate their forefathers, yet he must remind him that the practice of farming had recently undergone great improvement, and he could add that it would be impossible for rents, rates, wages, and expenses generally, which had in some cases doubled, and in others trebled, in amount, to be paid if improvement had not greatly developed the products of the soil. Statistics showed that in the last twenty years the produce of the soil had increased enormously. With regard to the arrangement of farm buildings, he must remark that circumstances altered cases, and that the same rule could not possibly apply to all localities. The practice of the gentleman who introduced the paper seemed to be almost entirely confined to sheep on the chalk-soil of Hampshire. He (Mr. Neild) had no knowledge of that county, but he might say that what Mr. Davies described would not answer in his part of the country, and perhaps it would be better even for that gentleman if, instead of selling his turnips at the price he mentioned, he kept some good beasts, and saw something of the other side of farming.

Mr. H. TRETREWY (Silsoe, Ampthill) said when that subject was placed on the card, he felt that it was rather indefinite, and had some doubts as to how it would be treated, and he must confess that he was now disappointed at the way in which it had been brought forward. He thought they would have had something more tangible. The introducer treated the question in such a discursive manner, that he felt it exceedingly difficult to follow him, but there were two or three points to which he wished to draw attention. In the first place, with regard to chalk, he quite concurred in what had fallen from Mr. Trask. He did not know what was now the practice in Hampshire or the western counties, but chalking was certainly by no means abandoned in Hertfordshire (Hear, hear). He happened to know something practically of that matter, and he considered chalking, even now, one of the best operations that could be conducted on a farm. Indeed, he knew nothing scarcely that conduce more to the fertility of the soil, even where chalk lay within a foot or two of the surface (Hear, hear). Another point to which he wished to refer had reference to root crops. Mr. Davies wished such crops to come pretty near together, so as to save labour. They all knew, however, that a farm might consist of a great many soils, and that it was not all fields that would carry roots; besides which they had to consider rotation, and to bear in mind that there were many things of more consequence than roots. What Mr. Smythies said respecting the arrangement of farm buildings was no doubt right to a certain extent, or under certain circumstances; but as regarded that all arable land should be near the homestead, he must observe that they all knew as practical men that frequently their best grass land was near the homestead.

The Rev. E. SMYTHIES: It may be the worst.

Mr. TRETREWY: He said that generally the best grass lands were near the homestead, and he thought any man who knew much about farming would confirm that statement, and it would be an utter muddle to plough up such land in order that the arable crops might be near the homestead. Mixed soils required a proportionate mixture of crops, and mathematical rules could not be carried out amid such variety. As to the remarks of Mr. Davies about farmers when they

came into a fresh locality looking over their neighbours' hedges to see what they were doing, he thought they were all pretty well aware of the necessity for that (Hear, hear). They all knew that if a farmer went into a strange neighbourhood and carried on there his old ideas connected with soil and climate, he would very soon come to grief. Another idea which the introducer of the subject seemed to think novel, was that when lands were drained the drains should be mapped. Why he (Mr. Trethewey) had supposed that there was scarcely a land agent or farmer in the country who didn't know how the drains ran, and he might add that it was the duty of occupiers to see that the drains were properly clear.

Mr. J. J. COOPER WYLD (London) regretted that nothing had been said in the course of a discussion with regard to method on the proper management of time, or the distribution of men over a farm so as to secure the greatest economy of time. They all knew from experience that, not only in farming but in all the affairs of life, the man who had no method as regarded time was sure to be a muddler, and that it was the man who was methodical in the arrangement of time that was most likely to prosper, while those who neglected that duty very frequently came to the workhouse.

The CHAIRMAN, in summing up the discussion, said he agreed with Mr. Davies that success in farming depended greatly on method. He also agreed with Mr. Smythies that in the midland counties there were to be found some of the most wretched homesteads on the face of the earth, and he might add that on the following day it would be his duty to go down there, and try and upset some of them, with the view of substituting better ones. With respect to chalking, he recollected reading a remark of an esteemed member of that Club, Mr. Cathbert Johnson, to the effect that chalking was good for the father and bad for the son.

The Rev. G. DAVIES having briefly replied, a vote of thanks was given to him as the introducer of the subject, and a similar vote was accorded to the Chairman.

At a meeting of the committee, on Monday, February 5th, Mr. Henry Chellins in the chair, there were also present Messrs. G. M. Allender, J. Bradshaw, J. Brown (March), W. Brown (Tring), T. Congreve, L. A. Coussmaker, J. Cressingham, T. B. Dring, J. K. Fowler, J. Howard, M.P., T. Horley, jun., R. Leeds, E. M. Major Lucas, R. Marsh, G. Martin, F. Neame, R. J. Newton, T. Owen, C. S. Read, M.P., B. P. Shearer, G. Smythies, J. B. Spearing, J. Thomas, W. Thompson, jun., H. Trethewey, J. Tyler, A. Voelcker, and J. Weall.

On the motion of Mr. Congreve, seconded by Mr. Sewell Read, it was resolved to present a memorial to the Chancellor of the Exchequer, submitting that agriculturists should not be liable to a dealer's licence for buying and selling horses.

It was resolved to take up six further shares in the Great India Peninsula Railway Company.

The following members have been elected for 1872.

E. R. Blewitt, Dovers, South Hornchurch.
 J. Carlton, Norbury Booth Hall, Knutsford.
 H. Dilben, Critchell, Wimbourne, Dorset.
 F. Eve, Newport Pagnell.
 R. Hardacre, Hellfield, Leeds.
 J. T. Homer, Hensworth, Wimbourne, Dorset.
 L. Taylor, Wrotham Park, Barnet.
 J. W. Wilson, Broadway, Worcester.
 G. Wise, Woodcote, Warwick.
 W. Bailey, Great Canfield, Essex.
 J. H. Baxendale, Worpleston, Guildford.
 R. Boning, Winfield House, Boro' Green, Sevenoaks.
 R. C. Catlin, Needham Hall, Elm, Wisbech.
 J. Ford, Portland Lawn, Leamington.
 R. Forrest, Llanfoist, Abergavenny.
 W. Golding, Leavers, Tonbridge.
 A. Stone, Hextable, Dartford.
 H. Brierly, Church Lawford, Warwick.
 F. Carr, Heslington, York.
 J. Carter, Great Marlow.
 W. Farthing, Stowey Court, Bridgwater.
 G. E. Harris, Hamstead Farm, St. Albans.
 J. H. Johnstone, Trewithin, Probus.
 M. Savidge, Sarsden Lodge Farm, Chipping Norton.
 W. Trethewey, Tregoose, Probus.
 R. Warner, Weston Hill, Bulkington, Rugby.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, Feb. 7, 1872.*—Present, Sir Watkin W. Wynn, Bart., M.P., President, in the Chair; Lord Chesham, Lord Kesteven, Lord Tredegar, Lord Vernon, the Hon. Wilbraham Egerton, M.P., the Hon. H. G. Liddell, M.P., Sir T. Dyke Acland, Bart., M.P., Sir A. K. Macdonald, Bart., Mr. Baldwin, Mr. Barnett, Mr. Clive, Colonel Challouer, Mr. Davies, Mr. Dent, M.P., Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Horsby, Mr. J. Bowen Jones, Colonel Kingscote, M.P., Mr. Leeds, Mr. D. McIntosh, Mr. Masfen, Mr. Milward, Mr. Pain, Mr. Randall, Mr. Rawlence, Mr. White Ridley, M.P., Mr. Shuttleworth, Mr. Statter, Mr. Thompson, Mr. Torr, Mr. Jabez Turner, Mr. Wakefield, Mr. Earle Welby, M.P., Mr. John Wells, Mr. W. Wells, M.P., Mr. Whitehead, Major Wilson, Mr. Jacob Wilson, and Dr. Voelcker.

The following new members were elected:

Backhouse, R. Onions, Westwood, Bridgnorth
 Bailey, J. B., 4, Coley Hill, Reading
 Ball, James, Peterstone Mills, Cardiff
 Beasley, J. Noble, Pitsford Hall, Northampton
 Benson, C., 93, Bull-street, Birmingham
 Blackstock, John, Hayton Castle, Maryport

Cadle, Miles, Stockton-on-Tees
 Danson, John Towne, Carnsdale Farm, Barnston, Binckenhead
 Edwards, D. T., Taif Well, Cardiff
 Edwards, Richard, Trevern Hall, Welshpool
 Farmer, Charles Haywood, Comberford Hall, Tamworth
 Farrer, H. R., Green Hammerton, Noak
 Fisher, Edward, Grove Hill, Beverley
 Fitz-Herbert, W., Swynnerton, Stone
 Foster, Matthew Henry, Little Wymondeley, Stevenage
 Hodgkinson, F., Kirkby Hardwick, Sutton-in-Ashfield
 Hodson, J. H., Loose Court, Maidstone
 Holmes, William, Cloverdale Island, Magee
 Jackson, G., Higher Peover, Knutsford
 Jackson, T. Finch, Tattenhall Hall, Chester
 Keightley, A. D., Old Hall, Milnthorpe
 Kings, W. Padbury, Lower Heyford, Banbury
 Leney, Edward, Hadlow Place, Hadlow
 Lloyd, R. T., Aston Hall, Oswestry
 McCalmont, A. Leighton, Broodgate Farm, Romsey
 McDougall, J. T., 158, Leadenhall-street, E.C.
 Mansell, T. J., Adcott Hall, Baschurch
 Minton, John, Forton, Shrewsbury
 Mockford, W. G. S., Vaubrugh House, Blackheath, S.E.
 Morley, R. N., Leadenham, Grautham
 Oldham, Tom Edward, Loddington Hall, Kettering
 Paddison, C. T., Stapleford, Newark

Peart, Isaac, Tewin Bury, Hertford
 Pidgeon, Hubert H., Torrington
 Proby, The Hon. W., Glen Art, Arklow, Ireland
 Proctor, H. Matthews, Hill House, Wykeham, Spalding
 Proctor, M. M., 49, Thornhill-square, Barnsbury, N.
 Read, James, Salisbury
 Smith, Henry F., Lanworth House, Sutton, Yorkshire
 Stewart, W. M., Culbourn House, Stranraer
 Thompson, James, Castle Meadows, Kendal
 Tsdall, E. C., Holland Park Farm, Kensington, W.
 Trethewy, William, Tregoose, Probuss
 Turbervill, Major Pieton, Eweny Abbey, Bridgend
 Tyler, John Hawkins, Tytherington, Falfield, Gloucester
 Vachell, Edwin, Penarth, Cardiff
 Wallace, Henry, Trench Hall, Gateshead
 Williams, Lewis, Redwick House, Chepstow
 Wilson, J., Larkham, Kimbolton
 Wright, Frank, Hill Top Farm, Ashbourne
 Wyley, H. J., Bridgnorth.

FINANCES.—Colonel Kingscote, M.P., presented the report, from which it appeared that the secretary's receipts during the last two months had been examined by the committee, and by Messrs. Qulter, Ball, and Co., the Society's accountants, and were found correct. The balance in the hands of the bankers on January 31 was £1,176 18s. 5d. The balance-sheet for the quarter ended December 31, 1871, and the statement of subscriptions and arrears, were laid upon the table; the amount of arrears then due being £1,151. Seventy-five members have given notice during the past year of their withdrawal from the Society.

JOURNAL.—Mr. Thompson (chairman) reported that the judges of the competing farms had all signified their acceptance of the appointment, and that arrangements had been made for the first tour of inspection to commence the last week in January. The committee recommended that 250 copies of the list of members be printed in a separate form, and sold at 6d. each. They referred it to the Council to decide whether the publication of the next Journal should be delayed, if necessary, for a few days, in order to admit of the publication of forms of guarantees of artificial manures and feeding-stuffs. This report was adopted, and the publication of the Journal was ordered to be deferred accordingly.

HOUSE.—Col. Kingscote, M.P., reported that the resolution passed in December last, respecting the retirement of the hall-porter, be carried out, and that he should receive a pension of £20 per annum, paid quarterly in advance. The committee further recommended that the secretary be requested to engage another porter, who should undertake, in addition to the present duties, the packing and posting of the Journal; and that his salary be £1 1s. per week, with clothes and other allowances as at present. This report was adopted, after some discussion, and the rejection, by 18 votes against 12, of an amendment moved by Col. Challoner, and seconded by Lord Tredegar, that the pension of the retiring porter be £25 per annum.

GENERAL, CARDIFF.—Lord Vernon (chairman) reported that the conditions under which the Marquis of Bute and Major Pieton Turbervill proposed to offer prizes for cottages, in connection with the Cardiff meeting, had been submitted to the committee. They recommended that an entrance fee of 10s. be paid by competitors; that plans and specifications should be sent in to the secretary by July 1; and that the secretary be authorised to advertise the competition in the usual papers, and in those that are connected with the building trade.—This report was adopted.

ELECTION.—Mr. Thompson (chairman) reported the recommendation of the committee that the Earl of Leicester be elected a member of Council, to fill the

vacancy caused by the election of Sir A. K. Maedonald as a trustee.—This report having been adopted, the Earl of Leicester was unanimously elected a member of the Council, on the motion of Mr. Thompson, seconded by Lord Tredegar.

SPECIAL COMMITTEE ON RECEIPTS AND EXPENDITURE.—Lord Vernon (chairman) reported that reports had been received from the implement, stock, prizes, and showyard contracts, committees, and from the honorary director, consulting engineers, and secretary. These reports had been ordered to be printed, and circulated amongst the members of the committee.—This report was adopted.

CHEMICAL.—Mr. W. Wells, M.P. (chairman), reported that the committee had drawn up forms of guarantees which vendors of manures and feeding stuffs can be invited to sign. These forms, when printed, will be sent to members of Council for consideration; and if approved of at the next Council meeting, it is suggested that they be issued on application, at a trifling charge to members of the Society.—This report was adopted.

STOCK PRIZES.—Mr. Milward (chairman) reported that letters had been read from several persons complaining of malpractices with regard to the exhibition of pigs, and that the committee recommended that the attention of the stewards and judges be called to this subject, and that any persons found guilty shall not be allowed to exhibit in future. The committee also recommended the following addition to the rules of the Cardiff prize-sheet: "No mare will be eligible for a prize unless certified, either at the date of entry, or between the date of entry and that of the show, to have had a living foal—or that the foal, if dead, was born at its proper time—in the year of the show. Or in the event of a mare being exhibited without a foal at foot, a certificate shall be given at the time of entry that she has been served, and the prize shall be withheld till a certificate be produced of her having produced a foal."—This report was adopted.

IMPLEMENT.—Colonel Challoner (chairman) reported that the committee recommended that the Secretary be instructed to ask, in the "Country Meeting Queries" for 1873, for not less than eighty acres of land, in such proportions of tillage as the Society may require.—This report was adopted.

VETERINARY.—Mr. Thompson reported that the Governors of the Veterinary College had not yet elected a Principal in the place of the late Professor Spouner, and that the committee were therefore unable to report further on the relations between the Society and the Royal Veterinary College. It was also reported that the committee had received a report from Professor Simonds on the subject of Hardon's Patent Cake, and lamb disease in Lincolnshire, and had recommended it for publication in the next *Journal*.—This report was adopted.

Letters were read from the authorities of Newcastle, Hull, and Darlington inviting the Society to hold its country meeting for 1873 in those localities; and from the authorities of York and Durham declining to invite the Society on this occasion. Mr. Thompson gave notice, that at the next monthly Council he would move "That towns competing for the country meetings of the Society be no longer required to send deputations to attend the monthly Council in May."

The prize-sheet of the International Exhibition of agricultural implements, machinery, &c., to be held at the Hague in September next, in celebration of the 25th anniversary of the institution of the Dutch Agricultural Society, was laid before the Council.

THE PROGRESS OF THE PLOUGH.

BY CUTHBERT W. JOHNSON, F.R.S.

The history of any agricultural operation is not only interesting but is attended with useful results. Take, for instance, the subject of this paper. When we examine the earliest notices of this implement, then made entirely of wood, and thus causing a very considerable waste of animal power, trace it forward until the days of the great modern implement makers, and still onward till the time when the locomotive is banishing animal power, are we not by such a retrospect well encouraged to expect still greater improvements in those modern locomotives? So that as steam is fast banishing the plough-horse, we may not despair of seeing his place occupied by the steam-engine for even the dung cart and the harvest waggon.

There is abundant evidence that the plough was employed by mankind at a very early period. It is true the first notices which have escaped to us are very slight—such as that in Palestine they ploughed with two oxen, and that their ploughs were constructed with a coulter and ploughshare. It is certain they needed the plough for their winter's fallow. Judging, however, by what we now witness in Syria and other Eastern countries, their ploughing was probably very shallow, and the plough animals poor, since it is certain that the ass, or even the goat, are still employed for this purpose on some of the light sandy soils of the East.

Then, again, the plough employed by the early cultivators was very rude; that of the Roman republic, in its shape, more resembled an anchor than a modern implement; and the same remark still applies to even the plough of India. In these cases the ground thus tilled could hardly have been more than scratched over. The Greek ploughs were of a better construction: they had wheels, a beam, a coulter, and two handles, somewhat resembling a modern wheel-plough; but these, from the shape of the stirrer, rather broke the soil than turned it over.

It is uncertain the shape of the early British ploughs. We are not aware whether they had wheels. We, however, learn from an ancient Saxon calendar, that our Saxon forefathers certainly made the implement with wheels; and from a rude sketch in another Saxon MS. we learn that they constructed some of their ploughs of a very rude shape, and even seem to have fastened their draught animals to this plough by their tails, a barbarous custom, which certainly was formerly practised in Ireland to such an extent that the legislature interfered in 1634, and declared, by the 11 and 12 Car. II., c. 15. entitled "An Act against plowing by the Tayle, and pulling the Wool off living Sheep," that "in many places of this kingdom there hath been a long time used a barbarous custome of ploughing, harrowing, drawing, and working with horses, mares, geldings, garrans, and colts by the taile, whereby (besides the cruelty used to the beasts) the breed of horses is much impaired in this kingdom. And also divers have and yet do use the like barbarous custome of pulling off the wool yearly from living sheep, instead of clipping or shearing of them." These wretched practices were then declared illegal, and to be punishable with fine and imprisonment. We may fairly conclude, however, from the few imperfect notices which have escaped to us that the cultivation of the early Britons was far better than is commonly supposed; and we must

not forget that our brave forefathers (who so gallantly met Cæsar even in the water, before he landed) are described by no friendly hand. Thus, when Cæsar arrived in England, about 55 B.C., he described the Cantii, or inhabitants of Kent, and the Belgæ, inhabiting the modern counties of Somerset, Wilts, and Hants, as much more advanced than the rest of the people in the habits of civilized life. They cultivated the soil; employed marl as manure; stored their corn unthrashed, and freed it from the chaff and bran only as their daily demands required. The interior inhabitants lived chiefly upon milk and flesh, being fed and clothed by the produce of their herds. "The country," adds Cæsar, "is well-peopled, and abounds in buildings resembling those of the Gauls, and they have a great abundance of cattle. They are not allowed to eat either the hen, the goose, or the hare; yet they take pleasure in breeding them." Cicero, in one of his letters, says: "There is not a scruple of money in the island, nor any hopes of booty, but in slaves"—a description that the industry and intelligence of succeeding ages has rendered singularly inapplicable.

When we find that the workmanship of the plough of our remote forefathers was rude and imperfect, this is not a matter of surprise; for among the early inhabitants of this country there were no artificers. The ploughman was also the ploughwright. It was a law of the early Britons that no one should guide a plough until he could make one; and that the driver should make the traces by which it was drawn of withs or twisted willow, a circumstance which affords an interpretation to many corrupt terms at present used by farming-men to distinguish the parts of the cart-harness. Thus the *womb withy* has degenerated into *wambye* or *wantye*; *wilken trees* into *whipping* or *whipple trees*; besides which we have the *tail withes* and some others still uncorrupted (*Leges Wallicæ*, 283—288). We read also that Easterwin, Abbot of Wearmouth, not only guided the plough and winnowed the corn grown on the abbey-lands, but also with his hammer forged the instruments of husbandry upon the anvil.

Then, with regard to the animals our ancestors employed in the plough, Lapenberg states in his "England under the Saxon Kings," translated by Thorpe, that "many horses were bred, every man being obliged to have two to his plough; hence, it is not surprising that the pirates of the north were so soon able to transform themselves into cavalry after their landing on the coast"; but as Mr. W. Skeat remarks, there are two instances in the Harleian manuscripts of a pair of oxen yoked to a plough. In the Bayeux Tapestry (A.D. about 1080) there is depicted a nondescript animal attached to a two-wheeled plough. It is clearly not a horse; but from its long ears it may perhaps have been intended for a mule, or it may after all have been a rude delineation of an ox, for the man walking by its side holds a goad. King Alfred, indeed, in his version of Orosius (who flourished in the fifth century) says, "Othare himself was among the first men of the land, though he had not more than twenty red cattle, twenty sheep, and twenty swine, and what little he ploughed he ploughed with horses."

The poet Chaucer seems to prove that the ploughman of the fourteenth century, though he might be possessed

of a single horse to use for riding, trusted to "cattle" for the purposes of husbandry. In the prologue to the *Canterbury Tales* we read of the ploughman :

His tithes paid he full faire and well,
Both of his proper swinke and his cattel,
In a tabard he rode upon a mare.

That horses, as well as oxen, were used in the plough in the Tudor days we learn from the earliest English agricultural writer. Although Fitzherbert, in his "*Boke of Husbandrye*" speaks in a manner that shows that even in his day plough horses were not generally employed, he observes, "a husbnde may not be without horses and mares, and specially if he goe with a horse plough." And a few years afterwards Bishop Latimer, in a sermon preached before the king, thus earnestly spoke in favour of the little farmers of his time, and alluded to their plough horses: "Let them," said the martyr bishop, "have sufficient to maintain them, and to find them in necessaries. A plough land must have sheep to dung their ground for bearing corn; they must have swine for their food to make their bacon of; their bacon is their venison, it is their necessary food to feed on, which they may not lack; they must have other cattle, as horses to draw their plough, and for carriage of things to the markets, and kine for their milk and cheese, which they must live upon, and pay their rents."

When Heresbach wrote (A.D. 1570), it was not uncommon in some of the warmer parts of Germany and Italy to plough during the night, "that the moisture and fatness of the ground may remain shadowed under the clodde, and that the cattell through overmuch heate of the sunne be not diseased or hurt." Worlidge, in his "*Mystery of Husbandry*," describes very clearly the first rude attempt to construct a subsoil plough: he tells (p. 230) "of an ingenious young man of Kent, who had two ploughs fastened together very firmly, by the which he ploughed two furrows at once, one under another, and so stirred up the land twelve or fourteen inches deep. It only loosened and lightened the land to that depth, but doth not bury the upper crust of the ground so deep as is usually done by digging."

Jethro Tull, more than a century since (A.D. 1735), paid considerable attention to the plough; he had even searched into the early history of this implement, and concluded that it was "found out by accident, and that the first tillers (or plowers) of the ground were hogs." The ploughs which he describes, and of which he gives drawings, were evidently (although still rudely and heavily constructed) superior in several respects to all that had preceded them. In fact, as is well remarked by my friend Mr. J. Allan Ransome, in his valuable work on the implements of agriculture, for ages the plough was little more than a rude, clumsy instrument, which served only to rake the surface, instead of making furrows in the land sufficiently deep for the seeds to be buried. It was not brought to anything like a perfect tool for the purposes required till the close of the seventeenth century.

The Dutch were amongst the first who brought the plough a little into shape, and by some means or other the improved Dutch plough found its way into the northern parts of England and Scotland. Those who have traced the history of the plough agree that one made by Joseph Foljambe, at Rotherham, and for which plough a patent was obtained in the year 1730, was the most perfect implement then in use; and to this day it is well known by the name of the Rotherham plough. This plough was constructed chiefly of wood; the draught-irons, share, and coulter, with the additional plating of iron to the mould-board and sole, being the only parts

Mention must also now be made of a step in the march of improvements by the ingenious and justly celebrated James Small, a Scotchman. He constructed a plough on true mechanical principles, and was the first inventor of the cast-iron turn-furrow, commonly called the mould-board; and, although more than a century has since passed, Small's plough may, in most respects, be referred to as a standard for the elements of plough-making. James Small established his manufactory of ploughs and other agricultural implements at Black Adder Mount, in Berwickshire, in the year 1763, and died about thirty years afterwards, having devoted the best part of his life to the furtherance of pursuits connected with agriculture.

It is difficult to follow the very gradual improvements which took place in the manufacture of the plough from the death of Small until the time when, in 1785, the late Robert Ransome of Ipswich began to employ cast-iron instead of wrought in its construction. Still more difficult is it to award the due meed of praise to the producers of such modern ploughs as those of the Ransomes, the Howards, and a host of other great makers. Of the steam plough, whose introduction has been so recent, and its progress so rapid, it is almost needless to speak. But there is a growing expectation that the time will come when the steam locomotive will travel with the load it propels. By this means it will be able to accomplish nearly all the work of the farm. This would seem to be shadowed forth by the terms of the prizes offered by the Royal Agricultural Society at the Wolverhampton meeting, and it is evidently the opinion of Messrs. Bramwell and Amos. In the excellent report of the engineers of the trials of the traction-engines exhibited at that great meeting they observe: "There appears no valid reason why locomotive engines should not be made suitable for moving agricultural machinery, whether thrashing, ploughing by means of windlasses, or for other purposes for which the farmer requires motive power; and it was with the view of encouraging the manufacture of such engines that the Society determined this year to offer a prize, not for a mere locomotive, but for 'the best agricultural locomotive engine applicable to the ordinary requirements of farming.' It may be as well to say a few words upon the history of common-road locomotion. It is now nearly forty years since Gurney (and there were probably others before him) exhibited his common-road steamer as a competitor with the stage-coach of the period. He was speedily followed by Ogle and Summers, by Maceroni, by Russell (whose engine, however, threw great discredit on the cause in consequence of its exploding), by Sir Charles Dance, and by Walter Hancock. It was this latter gentleman who from about 1825 to 1835, did more than any of his predecessors or competitors to show the feasibility of using steam-power as a means of propulsion on common roads at higher speeds than those attainable by the best stage-coaches. For many months together his steam-carriages, competent to carry from 15 to 20 passengers, travelled regularly from the Bank to Paddington and back at the ordinary sixpenny fares then charged by the omnibuses, and besides the Paddington journey he very commonly used to come out from and return to his factory at Stratford, his carriages passing through Whitechapel, Leadenhall-street, Cornhill, and the busiest parts of the City of London. In his steam-coaches he exhibited a very large amount of ingenuity and of engineering knowledge. The boilers and engines he manufactured would compare favourably with the best productions of the present day—a great thing to say of a man who worked 35 or 40 years ago, when high-pressure light engines were so much less understood than they are now."

From such a retrospective glance at the improvements

which have so slowly, yet so steadily taken place in the plough, we may well be encouraged to hope for still greater advances. When we note how rude was the original implement, how iron was slowly introduced in the construction, how it was first worked by the ox, and after-

wards by the horse, and that now the steam engine is fast superseding both, we may well feel assured, that by further improvements in the locomotive, much deeper and better ploughing will hereafter be accomplished than any we have yet witnessed.

MAIDSTONE FARMERS' CLUB.

PARASITIC DISEASES IN ANIMALS.

At the first meeting, held at the Star Hotel, Professor Brown, M.R.C.V.S., delivered a lecture on "Parasitic Diseases: worm in the throat of lambs, flukes in the liver, hydatids in the brain." Mr. T. Bridgland, jun., in the chair. Several additional members having been elected, the Chairman introduced the lecturer.

Professor BROWN said there was no doubt that the parasites were charged with doing a great deal of mischief of which they were perfectly innocent. They all knew if they had an animal in bad condition, with a rough, ragged coat and a voracious appetite, taking a large quantity of food, and apparently did it no good, the common explanation was that it was subject to worms, and, if a beast died from an obscure disease and it was found on *post mortem* examination that there were parasites, the cause of death was at once attributed to these animals which were residing in the interior. It was not possible to deny that in certain instances parasites do very considerable mischief, but there were many cases indeed in which they really do no harm at all. It was common enough in dissecting the body of an ox, a horse, or even a wild animal, to find numbers of parasites inhabiting various organs, but the location is very various, sometimes in the muscles, sometimes in the animal's brain, where their mere presence is necessarily injurious, sometimes in the intestines of the stomach, frequently in the liver, lungs, and kidneys, and sometimes in the skin, and indeed it may be stated generally that there is not a tissue, and certainly not an organ which is entirely exempt from them. Where parasites are present in the organ most necessary to the life of the animal, of course they do the most mischief. The most dangerous parasite is that in the brain, next those residing in the lungs, and next those which attack the liver, where they act injuriously by interfering with an important part of the digestive process. In other parts they remain for a considerable period, possibly for the life of the animal. In the life and history of the parasitic organism, there are many points which attract attention. The parent worms do not necessarily produce progeny that resembles themselves, which was a circumstance lost sight of for a great many years, and it was not until 1842 that a Danish naturalist discovered what is known as alternative generation, *i.e.*, that certain animals being themselves perfect in their organization, produce eggs in the ordinary way, but instead of certain embryos coming from those eggs like their parent, other animals quite different from the parent are the result, in some instances passing through five or six transitions, as in the fluke family. Commencing with the fluke worm, which was perfectly familiar to most of them, he said there were very sheepbreeders who have not had some opportunities of studying the worm in its site, and learning some of the effects which it produces in the organism. The flukes have been known for a great many years, in fact could hardly be traced back to their origin. They are found in deer, in the ass, in cattle particularly foreign cattle; and in the beasts of the Zoological

Gardens, different varieties are found, but as far as they knew the sheep is the only animal which suffers very considerably from them. Cattle never suffer from them, for he had met with them in the slaughter-houses in the livers of fat bullocks, but had never been able to associate with their presence any deranged condition of the animal, and the same is the case with the deer and wild animals. In the sheep, however, there can be no question that the flukes either produce the mischief themselves, or the circumstances under which they occur are injurious in their effects. The fluke worm occurs principally in low, damp situations, marshy lands, generally where there are large numbers of fresh-water snails. The animal is bisexual, that is, every individual fluke is both male and female, and has the horns of both sexes in its body. In all animals there is an immense number of eggs, which are thrown off and carried into the intestines, and from the intestines are thrown out in large numbers with the manure, and from this it is easy to understand the succeeding stages. In lands which are very high and dry with the sun shining upon them the greater part of the year, in what they called parched-up pastures, they were quite safe against attacks of rot, and also on land near the sea, where the earth is impregnated with salt, for salt is very unfavourable to the development of the embryo, but in lands where there is fresh water, there they had the conditions under which the embryo flourishes. It seems that the last stage of the fluke-worm development is where it becomes parasitic to the liver of the snail, and the cause of the affection of the sheep is the swallowing of those small snails, the liver becomes diseased, and the animal at first gains fat, apparently from the stimulus which is given to the liver in the first instance, then the animal begins to fall away, there is a shrinking of the muscles, the formation of the bag, as the shepherd calls it, under the throat, a general derangement of the condition, eventually terminating, unless something is done to prevent it, in the animal's death. Having pointed out that the land most favourable to the rot is also unfavourable to the development of healthy, nutritious herbage, which combined to render the sheep debilitated, he said the method of treatment was not difficult to suggest, but should be adopted before the mischief was done. It is clear that to prevent sheep rot they must be kept out of marshy places; but in certain localities it was not easy to do so, for they picked it up as they were being driven from one fold to another. Under all circumstances, however, it was possible to prevent sheep being driven along those dangerous places where the rank grass flourishes, and if the shepherd were aware of the danger he would take more care to prevent it. A man can never find out by fifty years' observation what parts of the land are favourable to the production of the fluke, and they could not expect that he should know this, but they could prevent the sheep from feeding on marshy places, and put them on grounds which are well drained, as all well farmed land

out to be, and see under no circumstances in those seasons when they fear an outbreak of rot that the animal falls away in condition, for they must either supply it with artificial food or take the risk. In the majority of cases it was quite possible, by keeping up the animal's condition, by supplying it with artificial food, keeping it out of suspicious places, and by adding to its food a certain amount of salt periodically, to prevent the animal from being affected with the fluke or any other parasite. After the disease has broken out it is desirable to keep them under cover, and find them dry food, but if that plan cannot be adopted the best plan would be to supply the sheep with a proportion of good hay while feeding upon damp pastures, so as to keep them from any of the objectionable herbage if possible. When it is fully developed no treatment is of the slightest use, and unless the animal can be removed to some high and dry situation nothing can be done; it does not matter how poor it is, so that the animal may have to work to get its food. Passing on to the second part of his subject he said the hydatid was known to the earliest writers, many years before the speculations as to the animal nature of the parasite arose, and the white spots which are to be seen upon it were attributed to a blow on the head, but after a time it began to be suspected it was really an animal. Mr. Hewitt first, and others, came very nearly to the truth, but it was not till 1852 that a German pathologist made the discovery that those elaters were mere tapeworms, and that the water bladder found in the intestines of the sheep, and frequently on the brain, is derived from the eggs of the tapeworm. But then the question arose how the eggs of the tapeworm were swallowed by the sheep, and this was, no doubt, caused by their having been dropped by a dog going over the ground, as the intestines of that animal contain several species of tapeworm. The changes are not complex. First, there is the hydatid, which is a water bladder having a tapeworm head, and this hydatid is swallowed by another animal, the tapeworm passes into the intestines, the joints grow one by one, when the last segment fills off, a perfect animal itself. The segment having fallen to the ground, is taken up by another animal, and instead of producing another tapeworm, the eggs or embryos bore their way through the structures, and ultimately reach the animal's brain, always going in a fixed direction to the brain of a sheep and the liver of a dog. The origin of the hydatid is in all probability the shepherd's dog; of course the fact of not keeping a dog does not prevent it entirely, for any stray dog might run over the farm, and if one dog only dropped a few segments of the tapeworm, the mischief is done. Of course the great security they had lies in the fact that an immense number of embryos are burnt up by the sun, crushed out of existence, before being swallowed by the sheep, or else from the number of dogs, and from the number of tapeworms in their intestines, the evil would spread over the whole country. He instanced a case on Salisbury Plain in 1852, where a singular fatality occurred amongst the sheep, nearly all being lost out of a flock of two hundred; it was on that particular spot that the owner was in the habit of exercising his greyhounds. The prevention of hydatid in the brain is perfectly easy where a dog is kept on the farm, the best plan being to give periodical doses which expel the worms; the common beetle-nut is a most deadly enemy to all the tapeworm family, and two or three drachms of this grated up and mixed with the animal's food, now and then, will render the sheep perfectly free from the tapeworm. The best treatment of giddy sheep is the immediate consignment of it to the butcher, and he showed that all the methods proposed for the extrication of the hydatid are useless, as if it is extracted it does not prevent the hydatid growing again, and another might form almost directly. The subject of the threadworm, which is most important, he said he left it to the last. The embryo is a very small one, and from it lambs have suffered more severely than calves. After mentioning the symptoms that indicate this parasite, he stated that when the lamb dies, the little worms are found accumulated in large masses in the tubes of the lungs, and the animal's death is caused by partial suffocation, and general debility. Under these circumstances it is not of the greatest importance to ascertain the cause or origin of the parasite, but to devise some means for its expulsion. Old sheep are affected with it as well as lambs, but in the former case they do not suffer so much, though they are

capable of infecting the pastures to a considerable extent, and if the embryo finds favourable conditions, the damage is great. Here they found moist seasons most favourable. So long as they have the eggs thrown out by the older sheep, so long must they expect the lambs passing over that land will take up an abundant quantity of the embryo. The eggs which these worms contain in the embryo, do not effect the sheep which take them up. If they were passing a flock of adult sheep over a piece of pasture, it might be assumed they drop an immense number of eggs over that pasture. If they took directly a number of young sheep over the land it does not result that they are affected, showing that in the condition they then are they are capable of affecting any animal which may take them up, but it seems, as in those transitions which occur in the fluke family, in the hydatid family some changes of a similar kind must take place in the embryo of the round worm before it is rendered dangerous. The Royal Agricultural Society has given Professor Simonds instructions to examine into the subject, and the inquiry is now going on, but nothing material can be discovered, more than what is at present known, as to the means of abating the progress of the disease. It is known that it is the embryo that is dropped one season by the old sheep which affect the lambs of the next season, and, therefore, although they could not state minutely every process, they were safe in concluding, that one of the most important means of prevention is to keep off young sheep from the lands which have been fed upon by older ones. If this were done throughout the country the loss would not altogether cease, but would become so materially lessened as to be no longer a matter of serious consequence, as at present. The next step in the way of prevention would be to treat the lands which had been fed over by the older sheep, and, for this purpose, lime and salt may be used, both being destructive to the germ of this parasite, and a topdressing of lime and salt will do good to the land, as well as destroy the parasites. The treatment of diseased animals is quite a separate question, and requires a great deal of care and attention the fact being that there are no means of directly destroying this parasite in the body of the animal without doing the animal a great deal of damage, and consequently all the remedies which are devised must act indirectly to be effectual. Small doses of turpentine frequently administered, and spirit of turpentine mixed with the yolk of eggs or a little glycerine, is an efficacious agent, but the best way of destroying it is by applying some irritating gas, such as chlorine gas (very easily produced), sulphurous acid gas, or carbonic acid gas. The grand secret in the treatment of all parasitic diseases was that the animals should be kept in good condition.

The CHAIRMAN asked if sheep known to be affected with fluke are removed to high and dry land where rot was never known to exist they would recover, if never taken back again. They had had discussions upon the matter at the Club, and there were various opinions upon it. Then again whether sheep were attacked by the fluke in passing swampy places by the roadside. And third, if they took some perfectly sound sheep and put them upon a newly-made pasture, such as ryegrass on a sewage farm, where it had been dry land, whether they would get the rot. As the sewage question was an important one to the town of Maidstone, they would be glad of information on the subject.

Mr. PLOMLEY said that generally the rot developed itself in badly drained fields, where the water had been stagnant for some time, and occurred not more than once in 15 or 16 years. He thought they would be liable to it this spring, in consequence of the wet season.

Mr. R. WATERMAN said that at Tenterden about twelve years ago, he saw many of the flukes, and many of the farmers in the district sold their sheep at low prices to the butcher. He kept his flock through, however, and bred lambs from them and he should advise anyone instead of having them killed to keep them, and feed them as well as they are able, for if they were killed they only fetched about ten shillings each, while others which brought up their lambs were worth 30s. or 40s.

Mr. FANCETT asked if the fluke could be taken up from the excrement of rabbits by the sheep when passing near the burrows?

Mr. STONHAM said having lost 16 calves by parasitic disease, he entirely endorsed the opinion of Professor Brown that preventive measures were nearly the only measures that

can be taken with any chance of success. When one was buying stock, he could not anticipate the evil, for very likely the germ might be laid, and the only way he could see was to buy at such a price as to make the living pay for the dead. He bought 68 Irish calves in two lots in the middle of the summer, one in July and the other in August. The first lot, numbering 36, was put on clean pasture, and he did not lose one, and of the next lot he bought he lost 16. He called in a veterinary surgeon, and discovered that they were infected with round worm, a number of the creatures as large round as a pipe being taken out of the bronchial tubes. He thought he could see his way to prevent that occurring for the future, for if he bought another lot of calves like that, he should begin with oilcake directly he got them home. Those he had saved were doing as well as they could do, taking down seven pounds of cake per day. One question arising out of the lecture he considered very important—Are those old pastures so valuable as it is generally thought they are? and he hoped that question would come on for discussion at some future meeting. The question is whether they are not a nuisance, whether they should not introduce a system of alternative farming and do away with these pastures.

Professor BROWN replied. The result of his observation was that when sheep affected with the rot were removed to high and dry ground, they had every chance of recovery, especially if they were obliged, in consequence of the scarcity of food, to take plenty of exercise. The result of this plan of management was that a large number of the flukes die off naturally, and the animal being placed in a position where it gets no new supply, the quantity diminished week by week, and at last the whole of them, or nearly the whole of them, are entirely removed. The whole question, however, depended upon the duration of the disease, but if as soon as they found the disease out they had them thus removed, he had no doubt the larger proportion of them would recover, and might be used again. With reference to the probability of animals picking up the disease by the roadside—he meant in those green lanes which frequently connected two parts of the farm—when the greater part of the farm was dry land, in some of the low parts of the green lanes running to the homestead the sheep were frequently driven, and it was there that the disease was caught. The question referring to sewage land was rather a difficult one to deal with. His own impression was there would be no risk whatever in feeding sheep on rye-grass on sewage farms as far as the rot is concerned, but it would be hazardous on another account—that of splenic apoplexy, which occurred in all those lands where there was an abundant quantity of manure, either liquid or solid spread. The question as to danger of rabbits running over ground and depositing their excrement, he could answer distinctly in the negative, for unless the dogs in the neighbourhood actually kill and eat the rabbits, there is not the slightest chance of the sheep taking the rot or hydatid on the brain. There was no question rabbits were subject to a species of worm, but not that which caused either of those diseases. With regard to the worm in the throat of calves, he said they must first get infected animals, or their land could never be rendered dangerous; and, in conclusion, he referred to the question of the old moist pastures, advocating their abolition, as they tend more than anything to spread the disease, and the inferior quality of the herbage tends to weaken the sheep.

The CHAIRMAN then proposed a vote of thanks to Professor Brown, who, in reply, suggested that the farmers should keep a book in which to note down facts which came under their notice, which would materially assist scientific men in pursuing their inquiries.

The following is the programme of the Maidstone Club for the year: Feb. 8—Professor Brown, M.R.C.V.S., on Parasitic Diseases, Worm in the Throat of Lambs, Flukes in the Liver, Hydatids in the Brain; Feb. 29—Dr. Monckton on The Labourer and his Relation to Agriculture; March 28—Mr. J. Bailey Denton, C.E., on Under Drainage, and the Steps to be Taken to Develop and Maintain its Effects; April 25—Mr. Henry Corbet on A Model Agreement; May 30—Mr. R. L. Everett on Suffolk Farming; June 26—Excursion to the Sewage Farm at Bishop Stortford; July 25—The Utilization of Sewage, and Mr. J. Rock on the A. B. C. System; Oct. 3—Professor Buckman on Results of Seven Years' Practical Farming of a Man of Science; Nov. 7—Mr. Henry Woods on Sheep Farming.

A "FAST AND LOOSE" COMMITTEE.—At Wigton County Court, before T. H. Ingham, Esq., judge, an action was brought by Mr. Henry Railton, of Snittlegarth, against Mr. John Brown, of Wiggonby, farmer, and Mr. Thomas McMechan, of Wigton, bookseller, late secretaries of the Wigton Agricultural Society; Mr. John Gate, of Wigton, spirit merchant; and Mr. John Jackson Mitchell, of Wigton, guano merchant, two of the committee of the said society; to recover £5 5s., the value of a second prize given by Mr. George Moore, for the best mare or gelding, four years old or upwards, exhibited at the show of the Wigton Agricultural Society, held at Wigton on the 13th September, 1871. The first prize was awarded to Mr. Fearon's Romeo, which had been purchased at Liverpool by the exhibitor. According to the rules of the Wigton Society, entries were to be made before the 5th September. Romeo was still unpurchased at 5:50 p.m. on the 5th, and the entry was not sent until the 6th. On the day of the show Mr. Railton protested against Romeo, and the committee considered the protest on the 3rd October, when a motion was carried by 7 to 6 to the effect "that Mr. Fearon do not receive the prize." Subsequently, however, Mr. Fearon threatened the committee with proceedings to recover the money, and the former resolution was rescinded. Mr. Railton, whose horse was placed third (Mr. Percy's being second), now claimed the second prize, upon the ground that Mr. Fearon's horse being disqualified the next in order of merit would take his place, and Mr. Railton would be raised from third to second. The plaintiff, in cross-examination by Mr. Hough (who appeared for the defendants), said that he had been a member of the committee, and that it had been the practice to receive entries after the advertised date.—Mr. Hough said the rule fixing a date for receiving entries was made for the benefit and convenience of the committee to make arrangements for the show. It was a rule they could dispense with at any time.—His Honour: It is a pity they should play fast and loose with it. Strictly speaking, no entry should have been taken after the 5th; but this rule has been invariably set aside with Mr. Railton's knowledge.—To Mr. G. Carrick (who appeared for the plaintiff): How do you come to claim the second prize?—Mr. Carrick: Mr. Fearon being debarred, then Mr. Percy takes the first prize, and we take the second.—His Honour: Does it follow that if A B C gets first, second, and third prizes, that if A is ousted, B steps into A's place, and C into B's? Mr. Railton never had the second prize awarded.—Mr. Carrick: He will, as a matter of course, if—His Honour: Where is the matter of course? I very much doubt it.—Mr. Carrick: I must contend that the rule must be adhered to.—His Honour: You have no power to vary it. It is a most important rule.—His Honour: Yes, it is a very important rule; but then you see it has been set aside over and over again. Mr. Railton must try to settle it with the committee.—You have got all wrong, now get all right. There was a great desire, he knew, to have as large an entry as possible, and they had had the benefit of seeing as fine a horse as ever he saw in his life, he thought. Now try to settle it with the committee.—Plaintiff: They won't settle it with me properly.—His Honour: I dare say they'll admit they have not done right.—Mr. Hough: I quite admit that Mr. Railton and the other members of the committee have acted badly in varying the rule.—His Honour: If Mr. Fearon had brought an action the committee could not have resisted paying after accepting the nomination. They would have had no defence.—Mr. Hough: Certainly not. He might have sued Mr. Railton as one of the committee.—Mr. Carrick asked his Honour to grant a case.—His Honour: I'll adjourn it for these gentlemen to settle.

THE ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—At the monthly meeting of the Council on Tuesday, February 6th, present, the Marquis of Huntly, in the chair, Mr. Baldwin, Mr. Battcock, Mr. Brown, Mr. Cantrell, Mr. Collins, Mr. Garrett, Mr. Naish, and Mr. Shaw, it was agreed that at the forthcoming election 33 names be added to the present list of pensioners, viz., 8 male, 15 female, and 10 married candidates, thus raising the total number of pensioners to nearly 300.

THE ROYAL SHOW AT CARDIFF.—Mr. Jacob Wilson will again act as a steward of stock in the place of the President, Sir Watkin Wynn; and Mr. Robert Leeds, the new stock steward, will be in the horse ring, a section to which he has already given his assistance at Oxford and Wolverhampton.

THE FARM LABOURERS' MOVEMENT.

If we remember aright one of the speakers at a recent meeting of a Chamber of Agriculture objected to any discussion over the condition of the labourer as especially inopportune; the protest being emphasised by the fact of this being made in a district where the men are "moving." To us, on the contrary, nothing would seem more politic than the consideration of the claims advanced should be taken at the outset, or, perhaps, more particularly at a comparatively idle time. We have seen men half-mad with drink "strike" on the rick in the very middle of harvest, when every hour or minute was a matter of anxious reckoning to the farmer, while the difficulties attendant on the last in-gathering must be fresh in the recollections of all. Let master and man then, if possible, adjust their differences at once, or at any rate let us not imagine that we can stifle such an agitation by affecting not to give it any attention.

So far as the Agricultural Labourer be concerned the question at issue is by no means confined to an increase of wages; but there are a number of collateral points to which the employer might with advantage give some study. A working man publicly stated in Shropshire the other day that he received eleven shillings a week, and that he paid five pounds a year for his cottage. A labourer in Leicestershire said the other day, that he had seen milk thrown to the pigs, a little of which he would have been glad to take home to his family. Others continually complain that if they are suffered to cultivate a bit of garden ground they have to pay a much higher rent than the farmer does for his land. Further than this, it is contended that there is little or no incentive for a good capable craftsman doing his best, but that he must be content to abide by the "regular" pay of those parts. Now, surely it would be well if such grievances as these were made the subject, not so much of general, as of individual inquiry; let, in a word, every employer make them "personal" to himself. On the common run of a labourer's wages is it fair that he should be called upon to pay as much as five pounds a year for the common run of cottage placed at his disposal? It may be said, in answer, that this, on the face of it, is an exorbitant rate; but still this has been spoken to without contradiction in certain districts, and in these districts the people are "rising." Again, though nothing can have a worse effect than giving a man a bit of allotment ground, it is manifestly unjust that he should have to pay more for this than the rent at which it is let to richer men. Nothing could, on the face of it, have a greater tendency to make men dissatisfied with the terms upon which they are treated; and it is alike the duty of landowners and occupiers to ascertain, each one for himself, the rents which the working man has to pay for his house and his garden ground. It is, moreover, occasionally stated at these labourers' meetings that the bit of ground is often denied a man, whereas there is no better aid than this or no better employment for his leisure hour.

In his excellent paper in the Royal Agricultural Society's *Journal* Mr. Dent brings the strongest testimony to the advantage of insuring to the labourer and his family a plentiful supply of milk, either by setting him up with a cow, or by the farmer providing this from his own dairy. Nearly all this evidence, however, comes from the North. "Excepting at the annual hiring," says Mr. Cully, speaking of the comparative prosperity of the Northumberland labourer, "he hardly knows what a beer-shop means, and his children suck at the milk-bowl instead of himself at the beer-jug." Here is another home question for the farmers of the Southern and Western counties. Would it not be as cheap in the end to supply labourers with milk

at the very lowest price, as throwing it all to the pigs, or sending it up, still at the lowest possible rate, to some London contractor? We doubt much whether the plan of each cottager keeping his own cow could be generally carried out, but we have no doubt whatever as to the mutual advantage of a regular supply of good fresh milk for the family, as this with bread is, for rich or poor, the companion staff of life. And here the labourer himself is not altogether without blame. Strongly as he may speak of his hardships, of the little his family has to live upon, he is manifestly reluctant to forego his "privileges," or his so many quarts of cider a day. If he will have wages in kind it would be less selfish and more profitable were he to exchange the cider for milk. And, again, the farmer must inquire of himself as to how this would suit his case? If cutting off the small cider would be at any temporary sacrifice to himself? In any ease he must be prepared to make it, as milk is almost the only payment in kind we would admit of, and then at little more than a nominal rate.

At the last labourers' meeting in Shropshire Mr. Strange, the Secretary and lever of the Society, quoted the admirable remarks made some years back by Mr. Charles Howard, at the Farmers' Club, on the advantage to everybody concerned of piecework. Mr. Howard, beyond showing how much such a system does for the farmer, said that "regulating wages by the quantity and quality of the work performed, is an incentive to industry, and affords greater scope for the exercise of skill, thereby giving the industrious and skilful man his legitimate advantage over the lazy and indifferent." And here, no question, is one of the weak places in the case of the "industrious and skilful" agricultural labourer. Once a ploughman always a ploughman, at precisely the same rate of wages; whereas in a manufactory the same man would have the opportunity of gradually rising from one rank to another in the establishment. In fact, almost the only opportunity of the rural labourer is piecework; and yet Mr. Sewell Read told the members of the Farmers' Club in only November last that "task-work is not gaining ground, but is rather losing it in agriculture." Not because the men dislike it, but because the farmers do not like to incur the trouble, or are, more positively, unequal to or uneducated in this branch of their business. Another home question arises here, and one which on the labourer's own pleading, must be answered.

There is hardly a man of any experience who writes upon Emigration but who couples what he has to say with a caution against people in any class of life hastily engaging in such a speculation. A suggestive incident, however, occurred at the recent gathering of the labourers in Shropshire, which we give in the words of the report: "We learn that before the meeting dispersed several labourers were engaged to go into Staffordshire and elsewhere, at considerably higher wages than they have hitherto received." And at Branton, in Lincolnshire, one of the speakers said in reply to a suggestion that each man should make an appeal to his employer: "I'd no chance to ask my mester, for he came to me on Saturday and said he shouldn't want me any more, so I thank'd him and went about my business. He thowt he was going to starve me, but I begun work this morning at another place at three shillings a day, instead of half-a-crown." It is but right to say that the movement is by no means confined to the "poorer districts," as they may be termed, but that the meetings appear to be more general and the tone more determined in Lincolnshire than elsewhere.

LAND TENURE.

At a meeting of the Warwickshire Chamber of Agriculture, at Warwick, Mr. T. HORLEY, jun., of The Fosse, read the following paper:

I have undertaken to introduce this subject from the conviction that it is of national importance, and a feeling has been increasing in my mind for years that many of the restrictions and remains of feudalism that exist in the shape of farm agreements and customs in many parts of this kingdom are not only a sure hindrance to the progress of British agriculture, and prevent the proper cultivation of the soil, but are also contrary to the spirit of the age in which we live, and will be looked upon in after years with astonishment that they could have held their sway so long, when it had been generally admitted that they were a great clog upon agriculture, and one main cause which has prevented that free flow of capital to the cultivation of the soil, which in a thickly populated country like this is so desirable. I say it is nothing but the necessity for the consideration of this subject, and the hope that we may (from the calm and deliberate discussion which I trust will take place to-day) set people to think on these matters, and, if so, I do not doubt great good will result, prejudice will be wiped away, and both landlords and tenants will see the desirability of some general system which, while it protects the owner of the soil, will secure for the capital invested in its cultivation and improvement greater liberty, and make it a safe investment. There will, I know, be great diversity of opinion as to how this can be best secured, but I think it will be generally admitted that the rapid changes and progress of British agriculture—from the days when, comparatively, only a small portion, and that the best of the soil, was occupied as tillage, and when at most the capital of the occupier consisted of a few rude implements and a little stock which was seldom housed or protected from the weather—have not secured to this branch of our national industry a thorough security for the capital employed. No doubt all advanced minds will favour leases; others, considering the difficulties in many cases, advocate yearly tenancy with compensation for unexhausted improvements. I will not enter into their comparative merits; but I believe one opinion has been universally growing of late years among all classes connected with the land of this country, landlords, agents, and occupiers, namely, that nothing less than twelve months' notice to quit could fairly exist. I cannot but think that a system of compensation for unexhausted improvements must greatly extend, and I trust become universal, whether land be held upon lease or from year to year, because it must ultimately tend to materially improve, and consequently raise the value of the land, offer a premium on good farming and high cultivation, and prevent landlords from being called upon, whenever a change of tenancy takes place, to make a large outlay to put the farm into a fair state or condition for entry. I know some persons think it better to spend their own money than to pay a sum to their predecessors for what they have left behind; but the majority of people capable of judging know well that it is better to be able to obtain a good harvest and keep a good amount of stock on a farm the first year of entry than to spend two or three years in bringing the occupation up to a fair standard of cultivation. I will not plead either for leases or yearly tenancies; my object is rather to seek for greater liberty in cultivation, whether the hiring be for a term of years or from year to year. We want to break the spell and charm of these old stereotyped covenants and conditions, which have placed innumerable hindrances in the way of agricultural progress, and we shall thus be conferring a boon alike upon owners and occupiers, and upon the country at large. The great amount of capital that is now necessary for the thorough cultivation of the soil and the production of the greatest amount of crop that can be raised from it without any exhaustion of its fertility, renders it necessary that there should be a removal of all useless restrictions and a thorough revision of existing agreements between landlords and tenants. The attention that is being given to this subject by thinking minds

from one end of the kingdom to the other, from the first nobles and legislators to the tenant-farmers, cannot have escaped your observation. I may adduce, amongst a few examples, Lord Derby's speech at Liverpool, where he said, "After making allowance for the picturesque and other tastes, which all desire to see more and more extended; the fact still remains, that we do not get, as yet, out of English earth, one half what we probably might do with advantage, if all our present resources were brought to bear on the soil; and I will add, if this work of agricultural improvement is to be carried on as it should be, it is the landlord quite as much as the tenant who must put his shoulder to the wheel. I believe what is wanted from the landlord is much less that he should put a large amount of capital of his own on the soil than that he should offer no obstacle to its being put on by the tenant. Security is the first requisite, and I hold that any tenant good enough to be kept permanently on the land ought to have a lease if he wants one, and the conditions of letting should be few and simple." The Earl of Leicester (whose estate generally may be looked upon as an example of high farming), speaking at Dorking, the other day, said: "I will ask you, have we in a favourable season on this description of soil obtained the greatest possible return at the least possible cost? Since I last met you, I have travelled much through England and Scotland, and taking into consideration the whole of the land I have seen under cultivation I think I may safely state that the produce of it might be nearly doubled under a perfect system of agriculture. I have observed a want of skill and capital on the part of the occupier, and an apparent want of assistance and encouragement on the part of the owner. The buildings were bad and inconvenient; the fields too small and ill arranged, and too often covered with useless timber. I do not believe agriculture will ever attract that capital, that skill, and that energy, which are requisite to bring it to perfection, until ample security is given in the form of a lease to the occupier, and from that lease many unnecessary restrictions (which exist in 99 cases out of 100) are omitted. I found in a lease in use on my estate there were many restrictions such as I should not like to be bound by were I a tenant. I have, therefore, with the assistance of my agents and my tenants, deviated from the beaten track, and endeavoured to form a lease more in accordance with the spirit of the age, avoiding all interference with the capital of the tenant, removing all clauses that dictate as to the cropping of the land, or the sale of the produce, and, as far as I can, giving him security for his capital invested. I have endeavoured to place my tenants in that position which I should like to hold as an occupier of land, and in doing so I am satisfied I have studied my own interest as well." Sir J. Trelawney, M.P., speaking in Cornwall on the subject, said: "A tenant wanted something to make him look upon the land as that in which he was permanently interested." Col. Corbett, M.P., at Ludlow, said: "The question of the tenure of land was a difficult one, but had been solved in some parts of England by an arrangement in the lease or agreement, by which allowances were made on either side, on the part of the out-going and in-coming tenants for crops and unexhausted improvements. There were other means of solving the problem; and he quite agreed that under any circumstances a man could not be expected to lay out his capital without a fair prospect of obtaining a return for his money." At Stowmarket, Col. Wilson said, in reference to the growth of beet-root for the purposes of distillation: "It stood to reason that whatever was for the interest of the tenant, so long as it did not injure the land, must in the long run be profitable to the landlord." Mr. C. S. Read, M.P., at Yarmouth, after referring to the Land Tenure Reform Association, of which Mr. J. S. Mill is the President, said: "It is of no use saying to us that when things are wild, revolutionary, and visionary, you must remember that things which were considered wild and visionary forty years ago have been adopted by the strongest Government the country ever had. Every institution of the country has to be tried on its own merits, I may say its

theoretic merits. One grievance I pointed out to you a year ago, as an occupier of land that in a great agricultural country like this the occupier of the soil has no right whatever to any of the improvements he makes; there is no custom; unless he makes a private agreement, all those things are by law the property of the landlord. The custom of the country you talk about, viz., Lincolnshire, and its Tenant-Right, may be very well for Lincolnshire, but why in the world should it not be right for Norfolk, and, I say, for all other counties? Under this system of payment for unexhausted improvements, the agriculture of Lincolnshire has wonderfully advanced. I will ask you, as practical men, whether, if you were to receive notice to quit next Lady-day, and had to leave your farms at Michaelmas, you would not leave in the land at least £1 per acre of your property, which, I contend, ought to be as much your property as the balance you may happen to have at your banker's? Now, I say, with increased appliances of science, we farm better, and we farm more extensively, every day. Landlords say they do not like long leases. There is a great deal to be said for and against them, but I cannot see what there is to be said against compensation for unexhausted improvements. There is a great deal of floating capital in the land that is at the mercy of the landlord, but of which it is said, to the honour of the landlords in Norfolk, they have not taken advantage. But, I say, whenever there comes to be a discussion on the land this will be one of the things pointed out to show the bad relation which exists between the owner and occupier. For goodness, gracious' sake, then, let us try to remove the evil before that day comes." To quote all the allusions that have been made to this subject within the last six months would detain you here much too long, as their number is legion, but I trust those which have been given will have the effect of setting thoughtful minds to work in endeavouring to find the fairest way (and that very speedily) for some general system which shall protect the owner from damage, allow the occupier greater liberty of action, and recomp him, what he is fairly entitled to. With a view to show more fully how impossible it is in the present day to farm the land so as to produce from the soil the amount of beef, mutton, and corn it is capable of producing, under the agreements that are now in force, and with a six months' notice to quit, I may refer to the reports on the farms that have been inspected during the last two years, and the prizes offered in connection with the Royal Agricultural Society of England. Some idea may be formed from those reports (which, no doubt, most of you have read, and all would profit by reading) of the amount of capital employed in the cultivation per acre, and also what position a tenant would be in were he compelled to leave with a six months' notice, and without any claim for what he has left behind. I notice that the expenditure per acre on the farms inspected this year is from about 35s. to over £3, per annum in artificial food and manures alone. I would also refer to an excellent paper written in 1863 by Mr. Thompson, a few years since President of the Royal Agricultural Society of England. After referring to the benefits of leases and compensation for unexhausted improvements, he says: "As these causes will probably long continue to operate, it is worth considering whether there are any practicable means of at once mitigating the evils arising from the prevalent custom of letting farms at will, or an agreement terminable at six months' notice. These evils, though apparently of very different kinds, such as injury to the public by the inadequate cultivation of the land, and injury to the tenant, who, without sufficient cause, is suddenly dispossessed of his holding, are all referable alike to the same cause, viz., want of sufficient security for the capital of an improving tenant." He then recommends nothing less than 18 months' notice being allowed to take a crop of corn from the whole of the arable land as some compensation. In a discussion some years ago at the Midland Farmers' Club on this subject, Mr. Randall, of Chadbury, who is agent to several large estates, and one of the best strong-land farmers in England, alluded to the absence in almost all agreements of stipulations for clean farming; he adverted to the agreement he had in use, which is a very great improvement on those generally adopted, and compensates the outgoing tenant for land that is clean and fit to plant, on the one hand, and, on the other, charges him for what is not in a good state, with compensation for purchased food and manures; and he tritely remarked, "Under the present system the first thing a man has

to do on taking a farm is to get it into a good state of cultivation; the last thing he does on leaving it is to bring it to as poor a state as possible. This was unquestionably the ordinary practice, and a very improper and ruinous practice it was, which had been forced upon the agricultural community by the fact that, if a farm be entered upon in a bad state of cultivation, there will be no compensation made for leaving it in a better state. Some means were needed to make it the interest of a man to farm well to the end of his tenancy, and to do this there must be compensation for good farming, and a penalty for bad." I will next refer to the Agricultural Customs' Committee which sat in 1848, and took evidence from about 50 of the leading land agents and farmers residing in about 40 counties. This, like most other "blue books," is rather wearisome to read through and comprehend, but a very good digest has been arranged and printed by the late Mr. Shaw and Mr. Corbet (second editor of the *Mark Lane Express*) entitled "Agricultural Customs in England and Wales." From this any one may gain a great deal of information on the subject we are now considering, and I think all who read the evidence that was brought to bear upon the question of "compensation for unexhausted improvements," will see that although they did not recommend legislation, it was very strongly advocated, and the following extracts show how beneficial they considered something of the kind would be. Clause 13, alluding to compensation for improvements, runs thus: "That the improvements above mentioned, which are generally required throughout the country in order to develop the full powers of the soil, are greatly promoted by this system of compensation; and, therefore, it is highly important that all difficulties should be removed which stand in the way of its extension, by the voluntary act of landlord and tenants." In another clause they say that this wider system of compensation to the out-going tenant seems to be highly beneficial to agriculture, to the landlord, and to the farmer, to lead to a great increase in the productiveness of the soil, and to the extended employment of the rural population. The 14th clause, to a certain extent, appears contradictory, but it is only so far as the desirableness of legislation is concerned. It runs thus: "That any attempt to make its general introduction compulsory would be met by great practical difficulties, and your Committee rely, for the general and successful adoption of the system, on mutual arrangements between landlord and tenant." Twenty-four years had passed away since that was written, and how far has the system extended? We find on reference to our own experience, if we have visited the districts, that in the limited area where it is the rule and custom of the country to pay for unexhausted improvements, and where security of tenure exists, the cultivation of the land is farther a head of other districts than it was at the time the Committee sat, and that the system has very slightly extended. Yet we find the good understanding between owners and occupiers which is so desirable (and which I trust will increase rather than diminish), stronger in Lincolnshire, where this system has long been a custom almost more binding in law than probably in any other county, the land in the highest state of cultivation, a thriving tenantry, and the labourers well cared for. In support of these customs I may say the opinion is gradually gaining ground in our own and neighbouring counties that the land will not be made to produce what it is capable of producing unless many restrictions are removed, and off-going tenants dealt with on a more liberal scale than has been the custom. I know that many landlords and agents are seeing the daily-increasing necessity for this. I cannot go further without referring to a paper on "The Duties and Privileges of Landlords, Occupiers, and Cultivators," read to the members of the Farringdon Club by Mr. John Beasley, of Chapel Broughton, a name well known in the agricultural world, more particularly as agent to Earl Spencer and other large territorial possessors; and I feel that, from the position he has occupied so many years, his remarks will be received with the attention they deserve. Speaking of the occupier he says: "There is nothing more important, perhaps nothing so important, as fixedness of tenure, and I believe it is the duty and interest of every landlord to secure this to his tenants in one shape or another. I do not mean to say that there will not (and ought not) to be exceptional cases, such as will of necessity arise; but I am convinced that under good management, they will be few and far between. I do not give any decided

opinion as to whether this security should be given by leases or other means. I think a landlord is perfectly free to choose whether he will adopt leases or not, and some tenants prefer to hold their farms without leases; but unless a tenant feels that he is secure of holding his farm so long as he farms it well, and maintains a respectable character, he is not placed in a position to do justice to his landlord, himself, or to the labourers of his parish." In alluding to agents, who exercise so much influence on the large estates of this country either for weal or woe, Mr. Beasley fully delineates what should be their capacities and character. Some persons may perhaps think this reference may be going rather away from the subject we are met to discuss—"Tenure of Land," but I feel that much more of the prosperity and happiness of the middle and lower classes connected with agriculture depends upon the thoroughly upright conduct and the intelligence of agents than the outside world generally believe; and in these days of rapid development and changes in agriculture, it is more than ever important for gentlemen thoroughly conversant with everything that is due to landlords and tenants, practical, experienced men, and with a high sense of honour, to occupy that position. All who have paid any attention to these matters must acknowledge the power and influence of gentlemen holding these appointments. You may see on one estate encouragement and facilities given to enterprising tenants; and, on others, nothing can be allowed out of the beaten track, or the least departure from the "red tape" rules that had perhaps not been altered for centuries. There are so many important matters connected with this subject, that I feel I cannot touch upon many of them. The question of the "repair and maintenance of buildings" is so important to both owner and occupiers, that I think it requires more attention than is often given to it. The old proverb, "A stitch in time saves nine," is too often forgotten in these matters. Owner and occupier must combine, if buildings are to be kept in a good state at the least expense; and this is very important, because landlords very properly only look at the income from their land after all deductions are made. This has led to great charges on large estates, where a regular staff of carpenters, painters, bricklayers, masons, and others connected with the craft have been kept and moved from place to place on the estate. A wonderful saving has been effected by dispensing with these establishments, which too often have to do repairs that would not have cost more than a tithe had they been done at the first, and by some one on the spot. This matter materially affects the occupier, because he often suffers loss and inconvenience, and is constantly reminded of the large amount spent in keeping his holding in repair. The agent of a large estate, where all the materials are found by the landlord, and the labour divided between landlord and tenant (the tenant having the control and supervision of workmen), tells me that that system answers exceedingly well, and is very much approved by the tenantry generally. There can be no doubt that a saving on this head may be generally effected by a proper combination on the part of owner and occupier, and the freehold be kept in a better state. This discussion will be very imperfect, if nothing is said at the present position and future prospect of the labour necessary for the proper cultivation of the soil. No doubt the extirpation that took place in many close parishes until the passing of the Union Chargeability Assessment Act, has and will exercise a very prejudicial effect upon agriculture. Good cottages and good gardens must become as necessary appurtenances to properties as good homesteads, if good labourers are to remain among us. I hope all who have not already done so, will read Mr. Dent Dent on the condition of the agricultural labourer, in the last number of the Royal Agricultural Society's *Journal*. The long distance often travelled to and from work is detrimental to the farmer, and when near a large town or in a manufacturing district, places him at a great disadvantage. It will, therefore, be necessary for owners and occupiers to unite in providing such accommodation and inducement as shall give the labourer more interest in his home and occupation. The education of the labouring classes in rural districts is also very closely connected with the land, but it will, I fear, have little tendency to raise them in the social scale, so long as they have not the power of living in their own houses, or bringing up their families with those ideas of modesty, decency, and self-respect, which are so desirable. The enormous amount of costly machinery now applied to agriculture requires steady

and intelligent men to superintend it; and I feel sure that nothing will tend so much to raise the social condition of the agricultural labourer as intelligence and self-respect, which we should all endeavour to encourage. The researches of clever men in connection with agriculture have removed much prejudice and ignorance as to the effects of continuous cropping of land. I could give many instances in confirmation of this statement. The experiments of Mr. Lawes, of Rothamstead (to whom agriculture is much indebted), prove that there is a natural fertility inherent in the soil, below which it cannot be reduced. Swift says the first cause of a kingdom thriving is the fruitfulness of the soil to produce the necessaries of life. We must, therefore, bear in mind that the more we produce in this country the less will be required from abroad, and the more wealth will there be to expend on other commodities. Railways, and the increase of the general wealth of the country has tended to advance the value of land more rapidly than formerly, and this must show the greater necessity which exists for more freedom of cultivation and security for capital employed in agriculture. The occupier is not in a fair position if he receives notice of a re-valuation or to quit his farm, unless he has a chance of being compensated for what he has expended and has had an opportunity of receiving benefit from it. I know many, very many, noble examples may be cited of good understanding between landlords and tenants, and long may they exist and be multiplied! I believe that these discussions, conducted in a proper spirit, will tend to cement them and place them on a firmer basis. We must, however, remember that life is uncertain; property may change hands, and fall into the possession of strangers; and, as is often the case, widows may be turned adrift, with large families almost unprovided for, their property having been invested in the improvement of the farm by their father, who may have been taken from them in the hey-day of life. I have now laid before you, although feebly I fear, the necessity which exists for some general relaxation of the covenants that usually exist between owners and occupiers, not altogether from my own experience, but from that of many eading men in the various stations of life connected with agriculture; and I think all who carefully, thoughtfully, and without prejudice, give to the subject the consideration it deserves must be forced to the conclusion that an absolute necessity exists for many alterations. Although time will not permit my reviewing many other interests involved in this question, we cannot shut our eyes to the fact that they must be considered; but I reserve for a future occasion my ideas on many important points in connection with these matters. I trust the discussion to-day will be of a character that will remove prejudice, tend to progress, and to cement more firmly the relations between the landlord, the tenant, and the labourer.

Mr. C. M. CALDECOTT proposed the first resolution, which was as follows: "That in the opinion of this Chamber the absence of any definite provision for securing to tenant farmers the capital and labour they invest in the land, prevents proper cultivation, is injurious to the true interests of landlords, is a grave disadvantage to tenants in preventing a prudent use of capital necessary for profitable farming, and is the cause of an immense loss to the nation in limiting the growth of food far below what the land is capable of producing." He referred to the conviction, which had for very many years forced itself upon his mind, that in this country the tenant farmer lacked security for his capital and labour put into the land, and that the needless, stereotyped restrictions in the ordinary contracts between landlord and tenant greatly interfered with the proper development of the productive power of the soil. Having mentioned several instances in which the existing system was detrimental to the interests of the proprietor and cultivator of the land, he expressed his cordial acquiescence in the resolution which he had proposed. Referring to the question of agreements, he observed that that which Mr. Newdegate, M.P., had introduced from Lincolnshire, contained as few restrictions as any he had ever seen, and it embraced a compensation clause; that clause was also inserted in Mr. Davenport's agreements, but the latter contained rather more restrictions than he liked, although they were comparatively few. What was generally required was the introduction of compensation clauses and the omission of the foolish and injurious restrictions which were not, as Mr. Horley said, remains of feudalism but of "lawyerism" If landlords acted

on these old stereotyped conditions, they would be food for all the lawyers of the country.

Mr. WAKEFIELD seconded the proposition.

Mr. C. N. NEWDEGATE, M.P., commenced by referring to the report of the Agricultural Customs Committee appointed in 1848, and of which he was a member. He explained that, at the solicitation of friends, he resigned his claim to take the chair in favour of the late Mr. Philip Pusey, an old advocate of agricultural reform, but who was a sort of enthusiast, and consequently all the witnesses called by the Chairman were those of most advanced opinions, but who in their cross examination gave the committee better material from which to make their deductions. The usefulness of the report and evidence generally was proved by the fact that the House of Commons had since ordered both to be reprinted, and had not appointed another committee on the subject. On the question of land tenure he (Mr. Newdegate) had long since made up his mind. About two or three years after the issue of the report of the above-mentioned committee, he, without venturing to recommend anything to his brother land-owners, adopted for his own estate an agreement containing a compensation clause, founded on the first series of clauses adopted in Lincolnshire, the latter being admitted to be the best Tenant-Right custom in England or Wales. His tenants, however, were so unwilling to accept it that before they would do so he had to give them notice to quit but they subsequently yielded, and presented his mother with his portrait as a mark of gratitude and respect. In the present meeting Mr. Wise, M.P., had placed in his hands a copy of Lord Leicester's lease. He (Mr. Newdegate) was not in favour of leases; and his opinion was confirmed in a very able article in the last number of the Edinburgh Review. The relations between landlord and tenant in England and Wales were different from those in Ireland and Scotland, the advantage being on the side of England. Any agreement between landlord and tenant, when stamped, was as binding on both as an Act of Parliament; and it appeared to the agricultural customs superior to laws, because of the great variety in the treatment of the soil and the general cultivation in different parts of the country. In some parts of the country under the form of Tenant-Right had grown up customs which utterly impoverished the incoming tenant. It was with a view of providing a limitation and safeguard against this abuse that he adopted a specific agreement. The notion proposed by Mr. Caldecott was very wide. He had opposed the Irish Land Bill as a direct invasion of freedom of contract. It might be necessary for Ireland, in her unhappy condition, to have various officials regulating the relations between landlords and tenants; but no such necessity existed in England, and it was an infraction of freedom which they would do well to curb. He thought the word should be "contract," instead of "provision," in the clause of the resolution as to "the absence of any definite provision for securing to tenant-farmers the capital and labour that they invest in the land." He believed that what was wanted was more definite contracts. Some irritation had sprung up, he did not know why, on these matters. He would call attention to an extract from a Coventry paper, in which the writer stated that a Warwickshire farmer was under notice to quit, because his son had accidentally shot a pheasant, and added, "In the legislation of freely-elected Parliaments, when members are not mere nominees of landowners, sitting for semi-rotten boroughs, but chosen in proportion to the population by an educated constituency—landowners will not be able to punish the nation as they have done in the past." There was written on the newspaper these words: "Can Warwickshire landowners and landagents after the Irish 'bumblings' stand by and see such a disgustingly hateful thing done?" This was a threatening letter, and it was essential to the happy relations existing between landlords and tenants, that now when larger capital was invested in agriculture than at any other period greater security should be given. He contended that if tenants had not that security it was in a great measure their own fault, because they did not have described in their agreement the exact terms of the relationship to the landowner which they wished. He would next refer to the question of limited ownerships, and suggest that in such cases the law might be amended so that under the supervision of the Court of Chancery security might be given to a tenant in the form of an agreement which would be binding against the estate

and its successors. Beyond this he did not see any means by which any real benefit could be conferred by legislation on the subject. It was a dangerous subject for Parliament to touch. Parliamentary interference had already gone too far in many directions, and a grave mistake might be made if Parliament unadvisedly interfered with the existing condition of agriculture in England, and with the tenure of land as it had done in Ireland. There was a different system, and on purely a commercial principle in Scotland, but it had resulted in a great increase of rent, which increase had been obtained by the landowners at a great loss to their own social condition, and much to the detriment of the country. In England the system was founded on the belief that the landlord and tenant were partners in one concern. The terms of the partnership ought to be definite and precise, specific and binding. He was not prepared to do anything to break up that partnership.

Mr. BROMLEY DAVENPORT, M.P., Alluded to his desire to see tenant farmers possessing proper security for the capital and labour they invested in the land. He read extracts from his agreements with his Cheshire tenants, by which his tenants enjoyed full security for capital, and proper compensation for unexhausted improvements. He agreed with the portion of Mr. Horley's paper as to the utter uselessness of many of the restrictions in leases. The resolution before the meeting talked about the land producing the greatest amount of food of which it was capable, but in order to do so they must remove all hedgerows, and render the country generally in a state in which he should not like to live in it. He was prepared to agree to any resolution to the effect that some sort of agreement should be the general custom for giving to the tenants security for capital put into the land. He vindicated the landowners from the sweeping charges brought against them, and urged that although there were rogues in all classes, the landlords as a body were worthy of implicit confidence. He did not approve of Parliamentary interference between landlord and tenant, because it would imply want of trust in the landlord, and want of common sense in the tenant.

Mr. PERKINS thought the hon. gentlemen who had just addressed the meeting were labouring under an erroneous impression in supposing that the Chamber desired legislative interference between landlord and tenant, instead of simply suggesting means by which to remove the hindrances placed in the way of the cultivation of the soil, and to obtain for the tenant farmer proper security for the labour and capital he invested in the land.

Mr. FINLAY DUNN (Shipston) depreciated any application for legislative intervention with landlord and tenant, believing that the landowners of this country and the educated tenant farmers knew their own business far too well to require the interference of a third party in making agreements for them. He expressed his concurrence in Mr. Horley's remarks with respect to the imperfect development of English agriculture. The agricultural produce of this country represented two hundred millions sterling per annum, and yet for something like forty years there had been but a comparatively small increase in this large return. It was estimated that there had only been something like 16½ per cent. increase in the agricultural returns of England, Ireland, and Scotland, during the last forty years. The increased application of machinery to agricultural purposes and the investigations which had been made by scientific men had attracted much capital to the land, and added to its productiveness, but its produce was far below the standard which should be obtained. An increase of one-tenth in the products of the land added twenty millions sterling of profit to landlords, tenants, and labourers. In the leases and agreements with which he was connected in Warwickshire, he had always recommended that there should be a certain amount of permanence in the arrangement between landlord and tenant. Mr. Newdegate had objected to leases as interfering with the partnership which ought to exist, and did exist between landlord and tenant; but he (the speaker) considered that a lease prolonged the partnership and rendered it stronger and more definite. Great injustice was often done to tenants who had laid out a great amount of capital on the understanding that the holding was to be permanent. He knew an instance in which a gentleman took a considerable tract of land, five or six years ago, on the assurance that he should not be disturbed. On this understanding he had laid out about £10 an acre in various improvements. Two years ago the property was sold, and

the tenant was now about to quit on six months' notice, leaving a very considerable amount of capital in the soil. He agreed with what had been said as to the extreme importance of unfettering the tenants as to the mode in which he cropped his land, believing that, with the advance of agricultural science, they might safely depart from the beaten track without deteriorating the permanent value of the land. In all the agreements with which he had to do he invariably allowed tenants to farm in any way they liked until within the last four years of the termination of their agreement. In order to induce the continued application of a proper amount of capital till the end of the term, it was important to introduce compensation clauses for improvements of various kinds. In this way a system of high farming would be maintained, which would be beneficial to the landlord, the tenant, and the public. One of the defects in the Earl of Leicester's new lease was that he did not recognise the necessity of allowing for manures purchased and buildings erected suitable to occupation, which might, with profit to the landlord, be included in covenants between landlord and tenant.

Mr. BERRY CONGREVE thought the Chamber had heard a little too much of the landlords' side of the question. Although not wishing to say a word against the feeling evinced by tenants towards landlords, he could not help thinking that they sometimes went too far in trusting to what was called good feeling and a sense of honour. Tenant-farmers wanted some security for their outlay, and to have their relations with their landlords not dependent on a good verbal understanding merely, but placed on a sound, business-like footing. Farming was a business, and, like other commercial transactions, it should rest on a firm basis so far as the terms of the occupancy were concerned. Every day they were witnessing the evils arising from the want of a proper system of Tenant-Right.

Mr. G. F. MUNTZ regretted that Mr. Berry Congreve should have spoken of there being different interests between landlords and tenants, because he believed that those interests were identical. Mr. Newdegate had complained of the wideness of the resolution, but the council intended it to be wide, in order that members might not be committed, and that the field might be left open to a free and full inquiry. As a landowner, he wished to have an agreement which, while protecting his property, would also give to the tenant security for every shilling he put into the land. Mr. Davenport had told the Chamber he gave compensation for bones. He (Mr. Muntz) wished to see a man paid for his brains. This was an important point for landlords. As the law and custom at present stood, wise and prudent men, who could get useful and profitable employment for their capital elsewhere, would not put it into the land; and if the same protection for capital existed in agriculture as in other branches of industry the flow of capital in that direction would be larger than it had ever been before. The landlords could not have high rents unless the tenants had large profits. Opportunities should be afforded the tenant of making the land more productive, but, under the present system, hardships were often inflicted on the tenant. He was not in favour of legislative interference, and he trusted that both landlords and tenants would give each other credit for the best intentions.

Mr. FOSTER said he was not opposed to legislative interference, and spoke strongly on the necessity for Tenant-Right.

Mr. NEWTON, chairman of the Hensley branch Chamber, deprecated legislative interference, and thought its operation impossible unless in England we lapsed into the state of things which existed in Ireland.

Mr. CALDECOTT briefly replied.

Mr. JOHN FORD, the Chairman, said: The subject we have been discussing is unquestionably one of national importance, and I think the council of this Chamber has exercised a discretion in bringing it to-day before its members. It is indeed a subject of great moment, for it affects not only the tenant-farmer but the landlord and the consumer, because if the tenant-farmer feels that he has a safe and tangible security for the profitable investment of his capital, he will be disposed to give a higher rent for his farm, which will be an immediate benefit to the landlord. He will also be induced to adopt a more spirited mode of cultivation, which will result in an increased production, and thus be beneficial alike to himself and the community. Mr. Horley's paper will I trust be instrumental in promoting the extension of the principle he has so ably ad-

vocated—a principle which men of great judgment and experience in these matters has affirmed to be not only most desirable, but actually necessary—this principle has at various times been called by various names, such a "Tenant-Right," and "Compensation for Unexhausted Improvements." Here we had it presented to us to-day under the more modified and less objectionable term of "Land Tenure," by which I think is understood the relations which exist, or should exist, between landlord and tenant, and which it is so desirable should be of such a nature as, while affording a complete system of preventing the deterioration of the landlord's property at each recurring change of tenancy, should also secure to the tenant the full benefit of his outlay, and of his unexhausted improvements, and thus do away with the pernicious and ridiculous system of annual tenure, which has seriously crippled, if not well nigh ruined, many an honest man and good tenant. I have listened with great attention, as well as satisfaction to the language and arguments which Mr. Horley adduced in support of his views, and I will do him the justice to say he has treated the subject with very great credit to himself. It is impossible in the short time at our disposal to go through the various points of the paper, but I have observed that while Mr. Horley lays down no dogmatical or infallible method of altering the existing state of things, he most emphatically urges the necessity of some change, and pleads especially for more extended liberty of action in the cultivation of the soil. This is unquestionably very desirable, and will follow in the wake of a more enlightened system of land tenure. Several other gentlemen have favoured us with their views, and it is literally impossible to reply to them all. I, myself, have long and deeply considered this subject, and I have come to the conclusion that we must look for a solution of our problem to those countries and places where we find the best principles and practices of farming prevail, and where they are attended with the most beneficial results. Mr. Horley has referred to the opinions of Lord Derby and Lord Leicester on the subject of leases, and he also said, at the commencement of his paper, that no doubt all advanced minds will favour leases. I cannot venture to include myself in this number, but I cannot help feeling that in Scotland, in Flanders, and in the Netherlands we shall see the benefit of this system of tenure. There are possibly and probably other ways of settling this question, such as a pre-arranged mode or rate of compensation for unexhausted improvements, or some well-defined system of agreement, by which mutual confidence is secured. That something must be done is beyond all question. No landlord can reasonably expect a tenant to lay out a large capital upon his farm without some kind of security, or bury his money in the soil without some chance of recouping himself, and I think while I may safely remark that long leases and good farming have generally gone together, and, *vice versa*, I may truthfully add that the landlord who in these days stands coolly aloof, declining to offer to his tenants any confidence or security in some form or other, is tolerably sure to find himself and his property left behind in the general rate of progress. I am very pleased to see so many landlords here. It is an angry of better times. I am equally rejoiced to see so many tenant-farmers. It is a proof they are at last become alive to their true position, and that the immobility with which they have been so long taunted is passing away; but I would just say a passing word to the latter, that they should have some consideration for their landlords; that, although the possession of landed property is very desirable as giving a social status, it is embittered by the recollection that it is the worst investment a man can make in a pecuniary point of view, and that with constantly recurring expenses in buildings, drainage, repairs, and other things, it pays a very poor rate of interest. I sincerely believe that landlords are anxiously and heartily desirous of doing justice to their tenants, but I fear they are not sufficiently acquainted with their wants, and leave too much to their agents, who as a rule are not better informed than themselves. But how can it be otherwise when we see perhaps a London solicitor deputed to manage an estate lying hundreds of miles away, and about the management of which he is thoroughly ignorant; or some head clerk or foreman promoted, or a broken-down old gentleman, or a poor relative or friend, or a retired officer who has spent all his life in India, suddenly chosen to manage a large property about which not one of them understand any more than a full private from a chosen regi-

ment of the Horse Marines? If noblemen and gentlemen would exercise a little more discretion in their selection of men for the management of their estates, we should not so often see or hear of those disagreements between landlord and tenant, which frequently bring—however unjustly—the former into disrepute. I know the position of the British farmer is neither one of satisfaction or repose. He sleeps in no more security than did Damocles of old; and the suspended sword, in the shape of a six months' notice to quit, is perpetually hanging over his head, threatening every moment to fall and pierce him through—to confiscate his property, to scatter to the four winds of heaven the endearments, the old associations, and loved and cherished hopes and memories of long and laborious years of anxious toil and active energy. I say these things cannot, they must not last any longer; the worn-out system of annual tenure, and the old stereotyped forms of agreement, must all be swept away; they are not consistent with any sound recognized principle of political economy, they are not in accordance with the spirit of the times, or the general advancement of the knowledge and intelligence which permeates all classes. Farming is no longer what it was—a primitive occupation, nor is it an antiquated traditional art capable of being transmitted from father to son, but it is now become a modern business, requiring much deep thought and scientific study to carry it on profitably and successfully. Agriculture, indeed, is now become the wisest of the sciences, for it embraces or touches up all problems from the constitution of soils to the laws of life.

Mr. Caldecott's resolution was carried.

Lord LEIGU (Lord-Lieutenant) proposed "That a committee be appointed to report on the best mode for removing the evils expressed in the first resolution, and that it consist of equal number of landlords and tenants, not exceeding twelve; four to form a quorum." After eulogising Mr.

Horley's paper and the speeches which had been made, his lordship expressed his cordial acquiescence in the sentiments enunciated in the paper, and in the resolution which had been adopted. He took it that the object which the meeting had in view, was to lay down some general rule or custom for the adoption of the country. Mr. Newdegate, Mr. Davenport, and many others, himself included, were quite ready, and had always been willing to give compensation for unexhausted improvements; but there must necessarily be many landlords who did not follow that rule. If the rule was generally followed throughout the district, it would be a very great gain to the community. The matter required grave consideration, and he thought the right course to be pursued would be to appoint a Committee to make enquiries, and report on the best means of removing the evils which were admitted to exist. He would not detain the meeting with any observations as to the importance of giving compensation for unexhausted improvements, as so much had been said on that point. He wished to make one remark respecting agreements, and that was that the simpler they were the better. The less a tenant was fettered by useless restrictions the better it would be for landlord and tenant; as a good tenant should have as much liberty as could possibly be afforded.

Mr. BERRY CONGREGUE seconded the proposition, which was carried unanimously.

The Committee was constructed as follows: Landlords—Lord Leigh, Mr. Newdegate, M.P., Mr. C. M. Caldecott, Mr. G. F. Muntz, Mr. G. Wise, and Mr. Mark Phillips. Tenants—Messrs. T. Horley, jun., Wakefield; J. H. Burberry, J. Hicken, S. B. Congreve, and Endall; the chairman, and vice-chairman, *ex-officio* members.

Thanks were voted to Mr. Horley for his paper, and to the chairman for presiding.

T E N A N T - R I G H T .

At a general meeting of the members of the Worcestershire Chamber of Agriculture, at Worcester, the subject discussed was Tenant-Right. Mr. G. Whitaker presided, and there was a large attendance.

Mr. RUSSON said, on the subject of Tenant-Right, he was perfectly aware of the difficulties surrounding the question, the delicate treatment it required, and his inability to do it that justice which its important nature demanded. He contended that the agriculturists, as a class, had an equal right to ask for a simple act of justice as any other class in the country, and if they asked for it in the manner recommended by Mr. Caird in the Scotch Chamber, no landlord need be offended. Referring to the present unsatisfactory position of the land question, he attributed it to the following causes: First, because many farmers invested their capital only so far as they saw the probability of recouping themselves within a given period; consequently the occupation was not so profitable as it otherwise might be, the resources of the land were not developed, and the people were deprived of that amount of food which they had a right to expect. Secondly, tenants had faith in their landlords, who were in the main honourable and just men, and would scorn to take advantage of them; but it occasionally happened that the landlord died, or the property passed into other hands. The new possessor, not feeling bound by the acts of his predecessor, had the farm revalued, and it generally ended in the rent being raised. Thirdly, such was the competition for land at the present time that, as soon as a farm became vacant, there were fifty applicants, who in their eagerness to obtain possession of it did not look very closely into the terms of the tenancy. To the question, "Why do farmers take their farms unless upon lease?" he answered that many landlords objected to grant leases, and that when they were granted they were very little good, excepting as letting the tenant know how long he would have his farm, and he made his arrangements accordingly. Another disadvantage arising from the absence of Tenant-Right was this—that, in consequence of the dependent position of the tenant farmer, he was unable, as an Englishman, to assert his right in the expression of his opinion with perfect freedom upon a subject in

which he was particularly interested, for fear of offending his landlord or the agent. When did the tenant farmers get from the Government that consideration which their wealth, their numbers, and the capital invested entitled them to receive? To show that tenants were sometimes victims to the caprice of the landlord, or to a dispute with the agent or gamekeeper, Mr. Russon quoted a case in which a tenant on the estate of a nobleman, who had conceded to his tenants the right to kill hares and rabbits, and was held up as a model liberal landlord, received notice to quit, or, in the elegant and figurative language of the agent, "liberty to remove himself and his capital to a more advantageous occupation," because a speech made by him at an agricultural meeting at Leamington had given offence. In his own neighbourhood a tenant applied for and received the refusal of a small farm contiguous to his own land, which farm had been in a most disgraceful state for years. On asking for a lease of the land, the agent replied that the landlord never granted leases, but that he was so well known as a good landlord, that no tenant, so long as he farmed properly, need fear being turned out, or having his rent raised. The tenant set to work to improve the land, and did everything to get it into a good state of cultivation, at an outlay of about £10 per acre. The old landlord subsequently died, the services of the agent were dispensed with, and, in the words of the Israelitish law-giver, "A king arose in the land who knew not Joseph." The tenant received notice to quit, and on writing to ask why he had been subjected to such treatment, as he was not aware of having done anything to deserve it, he received an evasive reply. On repeating his request, he had no reply at all. Some explanation of this might be found in the fact that the farm was let to the new agent's friend, who was the trustee of the agent's son-in-law, at a rental of 13s. per acre more than the previous tenant had paid. He (Mr. Russon) could vouch for the truth of this incident, as he himself was the unfortunate tenant. This landlord had since given all his tenants notice to quit, in order that a fresh agreement, a copy of which he read, might be entered into. One of its provisions was that the tenants should keep so many dogs for the landlord, and

another, that on the death of a tenant, the land should be given up on the 25th of March following. In return for this, the agreement provided that in case of notice to quit being given to a tenant, the latter should be entitled to receive from the landlord or the incoming tenant the full value of any unexhausted improvements. The Michaelmas tenants on the estate were also required to become Lady-day tenants. In consequence of what had been stated, however, there had been a little modification of the agreement in some instances. The landlord to whom he referred was a peer of the realm, and one of our hereditary legislators. His patent of nobility dated from 1442, and he evidently wished to revert to the usages and customs in vogue at that period. He (Mr. Russon) had no desire to make an attack upon landlords, but to expose injustice. These might be exceptional cases—he hoped they were—but robberies and murders were exceptional cases, and yet it was considered necessary to have laws for the protection of life and property. He contended that the landlord who exercised his power to appropriate that which belonged to the tenant, as the result of his capital and industry, was deserving of the epithet applied to it by the late Lord Clarendon, namely, “felonious.” In the first place, then, a system of Tenant-Right or compensation for unexhausted improvements, would be an advantage to the tenant, by giving him security for his capital, and compensation for improvements, he would be able to spend his capital freely, according to the modern and improved system of farming. In the next place, it would benefit the landlord, because more capital would be applied to the land, and greater fertility would be the result. But the greatest benefit arising from the establishment of Tenant-Right would be derived by the people, because, by the application of a vast amount of capital to the land, its resources would be developed, and a large additional food supply would be available for the population. The employment of the capital now paid for foreign corn upon the land would give increased employment to labour, obtain cheap and abundant food for the masses of the people, and tend to increase the wealth and prosperity of the country. What prevented the land from being brought into a high state of cultivation? And why should the millions required annually for the purchase of foreign food be paid to the foreigner instead of being kept in this country? Because there was no security for capital, no encouragement for the tenant to spend his capital on the land, and no Tenant-Right. He trusted the discussion upon this subject would cause the landlords, not only as an act of justice, but as a matter of policy, to combine with the tenants for the purpose of coming to a fair and speedy settlement of the question, thereby preventing the interference of those persons who, having little sympathy with the occupiers and owners of the soil, might claim to have some part in the arrangement in which the landlords might not receive that consideration to which they were entitled. He would conclude by moving the following resolution: “That, taking into consideration the non-development of the resources of the soil in this country, consequent upon the absence of sufficient security for the tenants’ capital invested therein, this Chamber is of opinion that a moderate and equitable system of Tenant-Right should be established, thereby benefiting the landlord, giving justice to the tenant, and increasing the supply of food for the people.”

Mr. PEARCE seconded the motion. Seeing that the landed interest was so insignificantly represented in that room, he thought there was a want of the feeling on the part of the landlord which the tenant very much needed at the present time. He regarded this as almost entirely a landlord’s question, and if it could have been approached under a designation other than that of “Tenant-Right” he should have seconded the resolution with greater pleasure. He himself had received compensation for unexhausted improvements, from three distinct landlords in that county; and therefore they must acknowledge that a great amount of consideration for the tenants was shown by a portion of the landed interest. At the same time they could not shut their eyes to the fact that some landowners were disposed to be overbearing, and were backward in giving their tenants that stimulus which they needed in the present day. He contended that the absence of security for a tenant’s capital excluded many intelligent and enterprising men, with great capacity for developing the resources of the soil, from the occupation of the land.

Mr. VARDEN said he agreed that the low cultivation of the land was an injury to the nation as well as to the owners and

cultivators of the soil, and it was their interest to seek out and remove the cause of the present state of things. English agriculture had grown from a simple art to a complicated science. Farming was now a commercial pursuit; the farmer was a manufacturer; and these changes rendered desirable a revision of the laws and customs regulating farm tenancy. All classes were interested in the result of the discussions upon this subject, for higher cultivation of the land would give the landlord more rent, the tenant-farmer more profit, the nation larger remuneration and more regular employment for its labourers, and the people a more abundant supply of food. The speaker, by pointing out that the amount of marketable produce considered by their grandfathers and great grandfathers as requisite for rent and taxes was about the same as that paid at the present time, showed that landowners had not been induced, by the great competition which existed for land, to extort a higher rent than the old custom proportion. He asked them to bear this in mind, for if some of the principles of Tenant-Right as now proposed should be carried into effect the system of rack rent must be substituted. As science advanced the large rates paid in some instances for land would increase, especially when greater experience was obtained, and higher cultivation took place. Thus, agriculture was not limited by what was possible or profitable. Extra cultivation would involve doubling the produce of the land, and to do that additional capital, larger than the present capital, was necessary, but how much larger was not known. It was estimated that probably £10 per acre would have to be provided by the landlords, making 460 millions, and the same amount by the tenants, making 460 millions more, or 920 millions in all—a sum which the nation could furnish in the next 20 years, without crippling its industries. If the security were good, immense as that sum was, the interest upon it would not equal the amount now paid for foreign food; and yet, by expending it in the country, they could raise three or four times the quantity of food obtained from abroad for the money. The security which the landlord could offer for raising this large sum of money would be the best, namely, the land itself, and the improvements to be effected upon it; consequently he could raise his share at a less rate of interest, thus showing that it was more advantageous for permanent improvements to be made by the landlord than by the tenant, because the latter, not having so good a security to offer, must pay a higher rate for his money. If, then, the landlords could raise the requisite money so easily, why did they not make the desired improvements? The decline of agriculture had been most marked since the one shilling import duty on corn was removed. That tax raised the price of wheat in the market 2s., and to that extent counterbalanced the local taxation then paid by the English grower. But those local payments had increased, and the import duties being now entirely removed, landlords were disinclined, in fact, they were unable and unwilling, to convert lightly-taxed movable capital into heavily-taxed fixed capital. This state of things was a great injury to the nation, for the nation required abundant food for its manufacturing prosperity, and to bring about that fiscal and intellectual improvement of its people by which pauperism and crime were to be diminished. Moreover, the greater prosperity of agriculture would react upon commerce and manufactures, and make them more prosperous also; but until this fiscal obstacle to the improvement of the land was removed, by reducing the taxation on fixed capital to a level with that on movable capital, landlords, as prudent men, dare not make the outlay; hence local taxation was the first requisite. The second requisite was to put the tenant farmers into a position to raise their share of the capital, and to apply it to that high cultivation by which alone they could obtain adequate remuneration for their capital and skill, and be able to pay the landlords sufficient rent for making an improvement of the freehold, and giving up the control of their property for long periods of time. He was in favour of long leases, which were viewed with great satisfaction in Scotland, as constituting the security upon which tenants could raise their part of the amount, and said he felt confident that long leases were the second power to which they must look for agricultural improvement. Whether long leases were adopted or not, a revised code of the laws and customs of farm tenancy was necessary for the interest of both landlord and tenant; and this, if made upon a broad and comprehensive principle, would be the third power of raising the condition of agricul-

ture. Wishing to cover the whole of the question, and not to fix their minds so entirely upon the wants of the tenant-farmers, but viewing them as the wants of the whole community, he proposed as an amendment: "That the want of security for the investment of capital in the improvement of the soil makes a revision of the laws and customs of farm tenancy desirable for all classes, and this Chamber hopes landowners and tenant farmers will cordially unite their efforts to obtain this principle on broad and equitable grounds."

Mr. WEBB (Fladbury) seconded the amendment, and said that what was most wanted in that county was a better custom. In some counties what they required was conceded by custom.

Sir JOHN PAKINGTON, Bart., M.P., said he deprecated the proposal of a motion and an amendment, because the tendency of such a course was to give the appearance of a difference of opinion. As one of the landlords of the county, he would at once say that he was perfectly ready to vote either for the original motion or the amendment, for it appeared to him that in spirit and intention they were nearly identical. Subject to a few words, which he would address to them, he took no exception to the term "Tenant-Right." He was perfectly prepared, in what he called a fair and legitimate sense, to accede to the principle of Tenant-Right. In his opinion the time had arrived when this important subject ought to be seriously entertained. Mr. Russon having referred to the case of Ireland, if he (Sir John) might venture to humbly offer his advice, he would say that the less they turned to Ireland for guidance in agricultural matters, the better. He did not think they would learn anything from Ireland. If they thought of adopting any part of the Irish system, there was one point on which he confessed he should feel great anxiety as a landlord, namely, that amongst the many liabilities to which a landlord was fairly open in this country, he should be sorry to add that of being shot—one of the most conspicuous liabilities to which an Irish landlord was subject. He hardly knew whether he would most consider this as a landlords' or a tenants' question; it was a question which deeply affected the interests of both. That was the deliberate judgment at which he had arrived, and he hoped the discussions upon the questions would be studiously conducted, with moderation and a just regard to what was due to the interests of all parties. Whether it was called compensation for unexhausted improvements or Tenant-Right, he thought they might sum it in one concise and expressive word, namely, security. He had had a very strong opinion upon this subject from the time of that great change in the position of the agricultural question dating from the Repeal of the Corn Laws. It must be admitted that that measure gave a great stimulus to agriculture, and an additional status to the British farmer. Their neighbours on the other side of the Tweed were in advance of them on farming, and he believed the cause of that superiority arose from the fact that

in Scotland there had always been a system of security. The consequence was capital had found its way to the cultivation of the soil. He cared not whether they called it Tenant-Right or compensation, the principle was security; for unless the tenant knew that the capital he put into the land was safe they would never have high farming, and without high farming they would never have that state of cultivation which was as profitable to the landlord as to the tenant, and equally to the interest of both. What, then, was the best form of security? Having on different occasions expressed himself in favour of giving tenant-farmers security by granting leases, he was bound to add that he had received very little encouragement either from the landlords or the tenants. He had generally found that the landlords were not fond of granting leases, and that in the majority of instances the tenants did not like to take them. He had offered leases to his own tenants, some of whom had taken them; and where they had been taken he, as a landlord, had no reason but to rejoice at the change. Men ought to be good farmers to embark in long leases, and in that case it was to the interest of landlord and tenant that leases should be entered into. A friend of his, who was a large landed proprietor in Scotland, and the owner of a fine estate in the well-farmed county of Lincoln, had his farms held under leases in the Lothians, and in Lincolnshire under what was there without guyness called a system of Tenant-Right, whereby a man giving up his tenancy made a claim for fair compensation for unexhausted improvements. Where a system of leases was adopted, it was found that a system of landlord-right must be introduced into the agreement, in order to protect the owner. It was only right that he should be protected from injury to the farm during the latter years of the lease; but though the Scotch system had led to a splendid method of farming on the estate of his friend, yet as an intelligent landlord he preferred the Lincolnshire mode of Tenant-Right with no leases. As a landlord and a landowner he (Sir John Pakington) had no decided feeling one way or the other, but he was strongly of opinion that, for the benefit of the landowner and for the benefit of the occupier, they ought to have some recognised system of security—a system under which the tenant should not be afraid to invest his capital in the soil. Whether that should be done in the shape of giving compensation for unexhausted improvements, or in the taking of long leases with proper covenants, was, he thought, a comparatively unimportant question.

Mr. SMITHEN said that, if tenants could be induced to farm as well at the end of the lease as at the beginning, the object would be met. Instead of being left in a state of exhaustion, farms would then be in a good state of cultivation at the termination of the occupancy.

Mr. VARDEN withdrew his amendment, and the original resolution was carried unanimously.

K I N C A R D I N E S H I R E F A R M E R S ' C L U B .

At a recent meeting Mr. G. J. WALKER, Portlethen, read the following paper on the breeding of Polled Cattle:

Cattle, always an important commodity in farming, have of late years become to the farmer in this country an object of even greater concern than formerly, inasmuch as, from the high price of butcher meat, it is more desirable than ever to put fat on them as quickly and cheaply as possible. To attain this end, I am sure you will all agree with me that there is more required than the mere food consumed, however nutritious. There is, I venture to say, a foundation required, in the shape of an animal, and good points, quality, and constitution. Without these, how often is the feeder disappointed and his money swallowed up, without any adequate return? I have not referred to breeding or blood, as I hold that good quality and easy feeding are unmistakable evidences of high breeding. If therefore comes to this, that we should always endeavour to feed well-bred animals, and to get a larger supply of these. I think the farmers of this county ought to breed more cattle than they do. They would then be more independent in such times as the present, with pleuro and murrain raging over the country. Supposing you make

up your minds to do so, the significant question you ask is "What breed shall we start with?" You will naturally suppose that I will at once recommend the polled Aberdeen and Angus breed; and so I do, provided your tastes induce you to breed a pure breed, because for this part of the country I know of no breed to equal them, all things considered. But if you are not so disposed, and wish to keep a cross or mixed stock, to rear bullocks for the butcher alone, then let it be of black polled cows, well selected, and a Shorthorn bull. The produce is as good a butcher's beast as exists. Or, what may be worth a trial, the opposite cross—Shorthorned or cross cows and a black polled bull. This is now being tried, I understand, by a gentleman in Aberdeenshire, and the success of the experiment may be watched: I am not so hopeful of it. But with all these crossings with different breeds, you should not go much further than the first cross, or else you will be disappointed. There is, beyond that, a tendency to long legs and coarse bone, and less of good feeding properties. It is a remarkable fact, in breeding high-bred cattle of the polled Aberdeen and Angus breed—and I doubt not the same may be said of all pure breeds—that the breeder can almost invariably

identify the offspring of any well-known bull or cow by the general outline and gait, and especially by the likeness of the head and ears to those of the sire or dam. I find that the females take generally after the dam, and the males generally after the sire, unless there exists any very striking feature peculiar to one or other, which will show in a more or less marked degree. But, as a general rule, my belief is that of the two—the male and female—the animal of the purest blood always has the greatest effect on the form and character of the progeny. I do not believe in farmers keeping and breeding two pure breeds of cattle at one homestead, however carefully they may do so. Black polled cattle were known first, I believe, in the counties of Aberdeen and Forfar, as the Buchan and Angus “doddies.” I am not aware of their origin; I believe it is very remote. I have heard the admirers of the Galloway breed claim for the Galloways that high privilege, but I do not think their claim is good—we have no proof of it; and with all due deference and respect for that excellent breed, I think, if from it has sprung the present Polled Aberdeen and Angus cattle, the parent has sadly degenerated in quality and form. No doubt the Galloways were at an early period better known in England and in the south of Scotland than in Aberdeen and Angus, as from their proximity to the Borders they were largely bought by the graziers of several English counties in the lean state, and taken over the Borders to be fed. But I am inclined to think that the Galloways and Aberdeen and Angus are two distinct breeds. At no very recent date, it was said that some of the breeders of Polled Aberdeen and Angus cattle, thinking to improve their stock by a dash of Galloway blood, did introduce such into their herds, with the desired results to appearance in the first offspring, but the succeeding generations did not, I believe, encourage any more experiments in that direction. Aberdeen and Angus cattle are now bred principally in the counties of Aberdeen, Forfar, Banff, Moray, and Kincardine. The old Angus and Buchan “doddies,” although in their general character very much alike, still possess different features in several instances, especially in the quality of the hair and skin, and the size of the ears. The Angus and Aberdeen cattle, from the mixing of the blood of the various herds, have now become one and the same. The foremost amongst the early breeders of polled cattle, and one who in his day did very great service in improving the breed, was the late Mr. Watson, of Keillar. Next to him I may mention Mr. Fullerton, Ardovie, now at Ardestie, from whose stock, dispersed some twenty years ago, not a few of the “cracks” trace their descent. Of late years the breeders of improved polled stock have largely increased in number. Several, no doubt, have given up the breed, but others have taken their places. I regret the withdrawal of Lord Southesk’s name from amongst the list of breeders of polled cattle, in consequence of the cattle plague unfortunately carrying off his lordship’s fine and valuable herd. The plague made sad havoc in several other herds at the same time, but notwithstanding all this the breed is gaining ground. Lord Southesk did a great deal for it, and not the least in my opinion, was the support and encouragement given by his Lordship in starting the Polled Herd Book. I suppose my father is now the oldest breeder of polled Aberdeen and Angus cattle alive. The first notable bull I find he had was Porty, by Colonel, from the tribe of Rosy, a Downie cow. Porty, before the days of the Aberdeen Show, won the first prize at Inverurie as an aged bull in a class open to Scotland, and his sire, Colonel, was born in 1818. Since that time, fifty-four years ago, the polled Aberdeen and Angus have been the only breed bred or kept at Portletten, and the aim has always been, so far as human forethought could do so, to improve the breed, but by all means to keep it pure. Of the leading breeders and most successful exhibitors of the present day I would name Sir George Macpherson Grant, Mr. McCombie, M.P.; Mr. Taylor of Glenbarrie, Mr. Morrison of Bogue, Mr. McCombie of Easter Skeue, Mr. Fordyce, M.P.; Mr. Bowie, Mains of Kelly; the Earl of Fife; the Earl of Airlie; Mr. Brown, Westertown; Mr. Paterson, Mulben; Mr. Walker, Montbleton; Sir Thomas Gladstone; Mr. Scott of Tulloch; Mr. Skinner, Drumin; Mr. Barelay, Anchlossan; Dr. Robertson of Hopewell; Mr. Leslie, The Thorn; and Mr. Ferguson, Kinlochtry, not to forget our respected Convener of the County, Colonel M’Inroy, who all take a deep interest in the breed. The points of a good polled Aberdeen and Angus bull may be described as follows: Colour, black;

head neatly put on; clean throat and sweet muzzle; not over long ‘twixt the eye and nose; eye bright and prominent; ear moderately sized; good breadth betwixt the eyes, and poll high; neck a good length, and clean—a little, but not over full on top; chest full and deep; legs short, but not so as to give the animal a dumpy appearance; bone clean, and free from coarseness; shoulders not too full, and top free from sharpness, but not over broad; back level and straight; ribs well sprung; deep barrel; well-ribbed down towards hook; full behind shoulder; hooks level, but not too broad for other proportions; and well and evenly-fleshed to tail; twist, full and long and well-fleshed down, but not protruding behind; tail of moderate thickness, and hanging straight; hair soft and plentiful; skin of moderate thickness, and mellow to the touch; body fully developed, and the animal, when in motion, to have a blood-like look and style about him. A cow should differ from a bull in the head, in having, instead of a broad, masculine looking head, a neat feminine looking one. The ear should also be of good size, with plenty of hair in it; the neck well put on, clean and straight, and without any prominence on the top, or abrupt hollow where it joins the shoulder; the top of shoulder sharper than the bull’s, and the shoulders themselves thinner. In both seurs are objectionable. It is the breeder’s study to get his stock to flesh evenly, and in feeding, to fill up in the most valuable parts. Freeness from any tendency to be bumpy or patchy is also desirable; but I do not believe, as some evidently think, judging from the criticisms one hears in show-yards, that such a tendency is a sure sign of impurity in the polled breed. In fact, we know from experience and observation that such is far from the case, and is often the effect of in-and-in breeding, and want of attention to the proper selection of the sires and dams, and should not therefore be recognized as any rule or guide in this matter. The polled breed, for their bulk, weigh heavier than Shorthorns or Crosses, and command the top prices of the leading markets. They are hardier and therefore better suited for our open and exposed country, and where Shorthorns would not thrive. We should consider these questions—what class of animals breeds most surely, stands the climate best, is hardiest, least liable to disease, is most easily kept, gives the best milk and in greatest quantity, grows and fattens soonest for the amount of food consumed, weighs heaviest for bulk, and, when ripe, realizes most per ewt. My answer is that the Aberdeen and Angus polled breed comes nearer to this standard than any other breed I know. Of course it will be admitted that to ensure success, care and judicious management are necessary. But these are requisite in all undertakings. There is a great mistake made, I am convinced, by farmers and graziers paying so little attention generally to the shelter of their stock over-night in the fields. One bad, cold, wet night will take more flesh off an animal’s bones than two good, dry, warm ones will put on, besides the injury to their constitution. Comparing the black polled animal with the Shorthorn or Cross, the Shorthorn and Cross grow faster, but eat about a quarter more food. This was tested by my father and the late Mr. Williamson, then the principal butcher in Aberdeen, at an out-farm of my father’s, by a careful selection of four polled and four Shorthorn Cross heifers. Each was weighed and valued, put on the same kind of keep, and all got as much turnips and straw as they could eat. The result showed what I say, that the Shorthorn Crosses required a fourth more food, and when all were sold off together at the end of April, the polled brought a couple of pound a-head more money. The animals were visited by Deacon Williamson every month. The first three months the Shorthorn Crosses appeared to gain considerably on the polled, but when spring set in the polled shot fast a-head, with the result above mentioned. Pedigreed stock should be paid more attention to by farmers than they are. What are pedigrees doing in England, and America, and elsewhere, for the breeders and owners of Shorthorn stock? Why, giving them in some cases from one thousand to two thousand guineas for animals worth to the butcher only £30 to £40, and even less. I think that the Highland Society, and all the local agricultural societies in the country, should make a distinct rule that the test of an animal being a pure Shorthorn or polled should be the Herd Book of these breeds, and make it impossible for any animal to be exhibited in these classes at any show whose pedigree cannot be traced through the Herd Book. I hope this will be taken up and brought to a successful issue. In reference to the pedigrees of

polled cattle, I am very glad to see that the second volume of the Polled Herd Book is now in course of publication, by Mr. Ramsay, of the *Staffshire Journal*, and Mr. Adamson, of Balquharn, formerly a pupil of the honourable member for West Aberdeenshire—gentlemen who, I am sure, will do justice to the volume. But it is to be regretted that some of the breeders have not taken that interest which the breed deserves, in getting the pedigrees of their stock completed and connected with the first volume, as, if the Herd Book is to be of value to the herd, this must be eventually of the utmost concern; in fact, so much so, that I hope to see the day very soon when breeders will decline to purchase any animal, however good-looking for breeding purposes, that cannot trace descent through the Herd Book in one unbroken line. The breeders of pure polled stock must also never breed from a cow, although herself pure bred, that has at any time been served with a Shorthorn or other than a polled bull, as I am convinced, from experiments with dogs, that such will affect the purity of the breed. As an example of the great care required in breeding pure breed of one colour, I beg to state a circumstance that came under my own notice a few years ago. My father had two heifers, two years old, which is the age at which they are first served. They were great favourites, and had been picked out to go together. They came in season, and were both served in one day. Shortly after, a strange black and white dog passing got amongst and frightened them, and the consequence was that they produced at the proper time a calf each, marked as like as possible, and almost spot for spot, with the dog. They happened to be both bulls, and they were soon castrated. Although the fashionable and proper colour of polled cattle is black, yet it sometimes happens that one appears with a brownish tinge, and I have seen others quite red. I think a good many of the old Buchanan "doddies" were red, and a good many of them brindled. These are generally of a good quality, and excel in milking qualities. To keep up the strength, character, and quality of a breeding stock, a judicious blending of the tribes and introduction of strange blood is occasionally necessary. But care should always be taken to get such of undoubted purity, and not to use any bull in the herd but of good blood and pedigree. The question of breeding in-and-in has been the subject of some discussion lately. I think it may be, and has often been, done to advantage; indeed, in several instances quality and neatness have been obtained, and an inclination to coarse, rough bone prevented, to my knowledge, by in-and-in breeding. But it should only be the exception and not the rule, and may as often be attended with bad as with good results. It is impossible, I think, to give any guide to go by as

to when it should be or should not be adopted, as it is purely experimental. I think the tendency amongst farmers is to confine young stock in winter too much. The great bulk are tied up; but I think they will grow and thrive better at all times if kept in loose boxes or warm straw yards with plenty of warmth and ventilation. Especially will this be apparent after they are put to the grass; and I think landlords should, in building new steadings, see that some part of the cattle accommodation is devoted to loose boxes, capable of holding a limited number of animals in each. I shall now make a few observations on the treatment of breeding stock. Bulls should not be kept fat, but in good fresh condition, and cows the same. The rule in my father's herd is to pay particular attention to keeping the blood of the cows in good order, and with this object, for a week before calving, she gets a dose of nitre each day—say about two ounces dissolved in a bottle of cold water. The third day after calving a purge is given, composed of 12 oz. of Glauber salts, 4 oz. cream of tartar, 2 oz. nitre, and 2 drachms ginger in powder, dissolved in boiling water, and this administered milk-warm in the morning, two hours before food, which should only be up till mid-day—or a little hay, with water *ad libitum*. This dose is followed by a similar on the seventh day after calving. These doses purify the blood, and greatly assist the cleansing of the cow. The same dose can be given along with bleeding, with good effect to cows or heifers, to induce them the more readily to conceive after copulation. If possible, all calves should be suckled, and when weaned are taken not to allow the calf beef to disappear. Cake, or other artificial food, ought to be given for some time for this purpose. In conclusion, I may be allowed to mention here, what may not be generally known, a wonderful cure for red water in cattle. I got the particulars of it from the late Mr. Thomson, of Banchoory, and it has been in our district of very great use, never failing when properly applied. Mr. Thomson, when travelling in Italy, got the particulars of the cure from a shepherd of that country, and on his return home he handed them to Mr. Charles Davidson, druggist, Aberdeen, who can supply all and sundry with the cure. I believe Mr. Thomson was anxious to try it on some of his own stock before offering it to anyone else, and said he was very much delighted one morning to be told that a young cow of his had got the red water. This animal was successfully treated, and was cured in a few hours. I think, in districts where this disease is prevalent, no owner of stock should be without the remedy. Before I sit down, I beg to thank you for your kindness and attention in hearing these few imperfect remarks so patiently.

SHEEP BREEDING IN NEW SOUTH WALES.

The following lecture was delivered by the Hon. G. H. Cox, M.L.C., before the members of the Agricultural Society of New South Wales:

The animal on which I am about to lecture, although insignificant as compared with those previously discussed, the horse or the ox, is nevertheless, of far greater importance to this community than both the other classes combined. I do not intend to enter into a dissertation upon the introduction of the merino sheep into this colony, nor trace step by step the increase in numbers and corresponding increase in wealth which its introduction into Australia produced. This may be learnt from the able article that appeared in the official report of the late Intercolonial Exhibition, written by Dr. Garran. My aim will be to show, as far as I am able, the extraordinary results which would be obtained by a more careful attention to the true principles of breeding, and the carrying out in a common-sense manner the dictates of Nature. I believe that much more attention was paid to the production of fine wool some twenty or thirty years ago than at present, or at any rate up to within the last three or four years. After the discovery of gold in Australia, meat became an article of so much value that wool was comparatively neglected for the sake of mutton. Hence the culling that was invariably made hitherto year by year was abandoned, and nearly all the flockmasters throughout the colony bred indiscriminately from anything in the shape of a

ewe, with the idea of increasing their number, and used any large framed ram he could get for the purpose of adding size and weight to the increase, regardless of the quality or quantity of the wool which grew upon their skins. What still further aggravated the evil was the fact that, even this inferior wool thus produced continued to realise high rates, owing, I presume, to the great impetus given to trade consequent upon the numerous influx of the precious metal into the manufacturing centres of the old world, from California and Australia. The large fortunes made by squatters (and wool-growers especially) induced a number of young men to embark in so apparently profitable an undertaking, and as many of them were utterly wanting in experience, they bought indiscriminately any sheep that were thrown into the market, and still further helped to bring about that rapid decline which was taking place in our staple production. The most disastrous results quickly followed. Wool declined in value, the price of meat fell, and sheep were depreciated in value to such an extent that, in many instances, squatters could not give them away, after having cost their owners, with the expense of forming new stations, some 20s. or 30s. per head. I have thus endeavoured to trace the causes which led to the decline of the article now under discussion, and I shall now attempt to show how the defects of previous years may be remedied. The first step then to be taken is for flockmasters to class their flocks, and to resolutely

throw out all animals that are unfit to breed a good fleece of wool, and fatten them off at once. For, on the old adage, that like begets like, so surely will these half-covered worthless animals perpetuate their own bad qualities. It would take generations, even with the help of first-class rams, before the flockmaster could turn such unprofitable sheep into good wool-producing animals. There is one thing that must have struck even the most unobservant person in these colonies, and that is that in our vast extent of territory, comprising almost every description of soil as well as climate, people should be found endeavouring to breed the same class of sheep on the cold and table lands of the great dividing range as on the hot and arid plains of the interior. In the comparatively limited area of Great Britain how many distinct kinds of sheep do we observe, and the farmer there would no more think of breeding or grazing the large framed Lincolns on the Yorkshire wolds or the Welsh mountains, or *vice versa*, the mountain sheep in the Lincolnshire or Cambridgeshire fens than he would think of growing tobacco or sugar cane; while here our flockmasters think they can produce the finest merino wool on lands and in climates which are totally unsuitable for that beautiful material, in spite of common sense and the inexorable laws of Nature, hitherto, we must admit, with but little success. For the production of the finest merino wool (combing or clothing) sheep require a moderate elevation and a temperate climate; an excess of heat or cold, or even an excess of wet, are all equally detrimental to the production of this description of wool. Combing wool has, I believe, a more limited range than fine clothing wool. Like wheat, it will not grow to perfection without good sharp frosts in the winter, when Nature provides a suitable covering. Excess of cold, on the other hand, makes this coarse, approaching the character of hair, while heat makes it light and frizzy like a negro's head. The area in New South Wales suitable for the production of this wool is undoubtedly that lying immediately to the westward of the Great Dividing Range, with some few exceptions, notably the country drained by the upper tributaries of the Clarence, Hunter, and Hawkesbury rivers. On the eastern fall in these regions I believe the most profitable wool to grow is what we call first and second combing, and to show the profit to be derived from this description of wool, I will state what I believe to be an average return of our Mudgee flocks, where this wool is chiefly grown. I take the average weight of fleece at from 2½ to 3lbs., and by last account sales the prices of the various brands averaged from 24d. to 31d. per pound; this will show a gross return of from 5s. to 7s. 6d. per sheep, say £325 per 1,000; deduct cost of shepherding, washing, shearing, &c., £120, leaving a net profit of £205 per 1,000 sheep. Of course, to have obtained these results a large outlay has been made, and years of attention to breeding have been given; but where these have been judiciously and carefully made, the results are even more marked, as the amounts realised by the sale of stud sheep considerably exceed the above handsome returns. The Mudgee wool has a character peculiar to itself. Its great characteristics are softness, strength, and extraordinary elasticity. Instead of the wave or curve which all wool possesses in a greater or lesser degree, our Mudgee wools have a curl almost like a lady's ringlet, and hence its great elasticity. It is not a favourite wool with English manufacturers; they call it a bastard wool, neither one thing nor the other, neither combing nor clothing; but on the Continent, and particularly in France, it is held in high estimation, and eagerly competed for. I would condemn very severely the practice of many sheep-breeders in continuously importing foreign blood into their flocks. Our climate tends to promote a softness in the wool—a quality which is almost wholly wanting in the German or Spanish merino; and by crossing with foreign blood you are fighting against Nature instead of assisting her, and the consequence is a mongrel type of wool, wanting in many of the elements of the pure Australian merino. Mr. Thomas Shaw observes: "The climate of the Australian colonies is as much superior to that of all others for the growth of fine wool, possessing every manufacturing quality, as that of England for the production of coarse wool. It gives the milling quality equal to Spain, and the softness equal to Germany. The wool grown by sheep properly acclimatised, and which have become truly Australian in character, possesses the good qualities of wool grown in both those countries, without the defects of either. It makes cloth as substantial

and useful as the Spanish, and as rich and ornamental as the Saxon. This is a great advantage, and I believe I am right in asserting that the Australian combing wool is the most valuable in the world. Although stuff goods were *first* made from German wool, Australian combing wool has been proved so far superior, that, could a sufficient quantity be obtained to suit the requirements of the trade, not a single pound of German wool would be used for that purpose. But these combing qualities must be bred for. It has here been shown what influence climate, unaided, has upon some qualities of wool, and the necessity of producing other qualities by artificial means. It is the nature of the Australian climate to produce fine wool to great perfection, communicating a superior degree of milling quality and softness; but length and soundness of staple, fulness and freeness of fibre, an essential in combing wool, we must breed for. If I am wrong in any of the above remarks, I shall be most happy to be corrected; if right, the absurdity of a continual importation of foreign staple is sufficiently apparent. The climate of Australia, as I have before stated, is superior to that of all others. Wool grown by sheep judiciously bred under its influence possesses all the essential qualities in a far superior degree to all other wools. What good can be obtained from foreign sheep I cannot conceive; but the evil effect produced is, in my mind, beyond all question. If we introduce German sheep, we injure the milling quality; if Spanish, we destroy softness, and it will take at least two or three generations to redeem these qualities. If the sheep imported are English, we destroy all these good qualities at once, and the only redemption is the butcher; it is like engrafting a crab on an apple to improve its flavour. We hear a great deal said about breeding in and in—every defect is attributed to this. I think, without any close investigation, it will be found that the evil lies in breeding out and out. There may have been cases where family blood has not been sufficiently renewed; but the great bulk of the mischief done, and the cause of the numerous defects in flocks, are bad selection, the importation of sheep not suited to the country, and injudicious crosses. I believe that in sheep, as in cattle breeding, the only scientific and certain method of accomplishing the end which the breeder may have in view is by in and in breeding. This, with a system of small paddocks, to be used at tupping time, where a limited number of ewes of a certain class may be placed with a single ram, also of a particular character, the capability of the ram for transmitting his good qualities to his offspring may be fairly tested. The practice now so generally followed of putting say a score of rams, to half as many hundred ewes, is invariably disappointing in its results, because all breeders know that, however good an animal may be, it does not necessarily follow that his progeny will be good. Sometimes an inferior looking ram will beget very superior woolled lambs. I hold that results similar to those I have stated as prevailing in the Mudgee district, may be obtained over a large portion of New South Wales. I am aware that in stating this I am looked upon as guilty of holding heretical opinions, and have been taken to task for giving expression to such heterodox ideas, but notwithstanding, I contend that on the whole of the "western slopes," extending from Queensland to Victoria, as coloured on the map (and from which the so-called "Mudgee and merino districts" have been very improperly excluded), sheep as good as ever were bred in Mudgee may be produced. Of the "coast and mountainous districts" I need say but little, as on the former the merino will not thrive, and in some places not even live, as on the swampy plains and moist atmosphere of the Clarence and Richmond rivers; while on other parts, as the Lower Hunter and Illawarra districts, the coarse English sheep only appear to do any good. On parts of the high table lands of the coast range sheep cannot live through the winter, while in other portions a coarser description of the merino appears best adapted to find sustenance on the sour grasses, and to withstand the inclement weather of those inhospitable regions. On the country marked "intermediate" a somewhat similar description of wool may be grown as on the "western slopes," wanting, perhaps, in softness, and, in many instances, not capable of being so well got up, owing to a want of water and the prevalence of dust; while on the great salt bush plains of the interior a combing, or even a fine clothing, wool cannot be grown. For the production of fine combing wool you require a mild climate, without extremes of heat or cold; you do not require rich pasture, but you must have abundance in all

seasons. Now, are these requirements to be found, as a rule, in the saltbush country? There you will experience, at any rate, extremes of heat; at one time sheep will be surfeited with a superabundance of exceedingly rich pasture, at another they must subsist upon dry withered grass, or even shrubs, and at the same time be living in a cloud of dust. Now all these phases through which the sheep pass, tend to the destruction of the characteristics of combing wool. A superabundance of rich feed at one time, and utter absence of all such at others, tend to the uneven growth of the fibre, and causes stricture. Again, the excessive heat, together with the dust, dries up the yolk, and for want of nourishment the wool perishes; dust accumulating on the skin prevents the rising of the yolk, and precisely as a barked tree dies for want of sap, so does the wool perish for want of its natural support, and hence becomes unsound, and, of course as such, unfit for combing purposes. When the great saltbush plains shall be irrigated, and when the sheep that roam over them shall be protected from the ferocious summer sun by thatched sheds, then, and not till then, shall we see combing wool grown in the great fattening country of Australia. To prove my assertion, I would ask in what country in the world, where the thermometer may range in the sun to 150 deg., is combing wool grown? Do we find it in India, Egypt, or South America? No. We may find clothing wool (though not fine combing wool) in the other extremes, as in Iceland; but I challenge my friend Mr. Bruce to show me where combing wools are grown in tropical or semi-tropical countries. Of course, I admit in isolated instances, or under peculiar circumstances, such may be the case—you may grow

pinapples at the North Pole, and you may grow combing wool on the Darling river. I may be asked, what then are sheep breeders in this great area to do? I answer, let them intelligently consider the capabilities of the country in which they reside; endeavour to find out what Nature tends to produce, and then assist her by striving to grow the best that the peculiar circumstances of the case will admit; precisely as the intelligent inhabitants of the mountains in Wales, or the Highlands of Scotland, endeavour to develop to the utmost the best qualities of the animals they find most suitable to the localities in which they reside. If the sheep farmers of New South Wales cannot all grow a Mudgee wool, they can, at any rate, produce a good, profitable article, and cover the wretched, scantily-clothed animals they now possess with double the quantity of wool they have at present. Were the fleeces of New South Wales increased in weight only to the extent of half a pound, and in value to the amount of 3d. per pound—and I presume that no one will deny this may be obtained without a very extravagant estimate of the capabilities of the country—we should have the astounding result of an increase of wealth to this colony of three-quarters of a million per annum; while the increased capabilities of the country which might be developed from fencing and ring-barking, especially in the mountainous parts of the country, are incalculable. It would be beyond the limits of my lecture to enter upon these matters, or the getting up and classing of wool; in fact upon this last thing alone a long lecture might be delivered, for it is a question of vital importance to the wool-grower, not only to grow good wool, but to send it to market in the best possible condition.

THE LABOURER'S HEALTH AND DIET.

At the dinner of the Romsey Labourers' Encouragement Association, at which the successful candidates were present, the Honourable W. F. COWPER-TEMPLE, M.P., the President, said:

There was no better drink than water, although it might not be quite so popular as beer. Some people could not get on without beer, but some found that water was the most congenial and refreshing drink a man could possibly have. Still, whether they took water by itself, or mixed with other things, it was quite as necessary that it should be pure and uncontaminated. Some things—such as Bass' pale ale—owed its good qualities to the water, for this ale was brewed with water which was very pure and soft. The necessity of looking after their water in the wells and other places was therefore of the utmost importance. Then with regard to the things consumed next to water came milk, which contained all the elements necessary for the nourishment of the body, especially those of young children, and to them it was absolutely necessary. It was a very great advantage to children in a district where they could have a supply of milk. It had often been remarked that the children in the rural districts did not look so well as those in provincial towns, and he believed the reason of this was because in the former they were a long way off from the milk, or their parents could not afford to get it, while in the towns they were close to where it was retailed. Several of the farmers in the neighbourhood of Romsey, and who lived on his estate, had been kind enough to take the matter up, and had made arrangements by which milk in small quantities should be sold to the families of the labourers who were working on their estates. This was an example which would be more readily followed if people could see the great importance of children having a proper supply of milk. On the proper feeding of the young depended their condition in after life. He did not care so much about their wealth, their minerals, or the production of their textures and fabrics and machinery, for what was the wealth of the country when compared with the health, the strength, and the moral integrity of the young people? Therefore everything should be done to improve the health of the children while they were young; for while they did this they were not only benefiting them, but they were contributing to the general welfare of the country. He thought a great deal might be done with regard to the health of the people. With reference to the cottagers he did not observe that the wives did as much with the vegetables in the

garden as they might. He did not discover that the labouring man, after his hard day's labour, went home, sat down by his fireside, and had a basin of warm soup. He could assure them that this often sent a man to his bed warm and comfortable, instead of his merely having his bread, and in this respect the people in England did not quite come up to those in foreign countries. If they went across the Channel—to France—they would see that the vegetables were made into a most agreeable soup, and which proved a very great comfort to the whole of the family. If the wives only understood the cooking a little more it would conduce to better health. Then there was another thing which he noticed in cottages in this country, and it was that great pains were taken to keep out as much fresh air as they possibly could. People might say it was done to keep out the cold, but that might be done without excluding the fresh air. There were many people who really were not aware that fresh air was necessary in order to enjoy good health. They did not know that fresh air invigorated the system, set the blood in motion, and promoted health and strength quite as much as solid food. And then, when talking about health, their minds naturally reverted to the great quantity of illness and disease produced by the intemperate use of fermented liquors. If they went to Winchester gaol they would find that two-thirds of the people who came there had been brought by the intemperate use of fermented liquors. If they went to the workhouse he was afraid they would find a large number were there from the same cause. They found it the same in their lunatic asylums, and, go to whichever quarter they liked, they would find that the health of both body, mind, and soul had been more deteriorated by the injudicious and intemperate use of fermented liquors than anything else. In the remarks he had made about the wives he wished it to be understood that he did not in any way find fault with those in that district. He was only giving them a few ideas which crossed his mind, and he must say that the wives and mothers of the working classes round about them were deserving of great admiration for their industry and the self-sacrifices they made in order to rear up a large family, to send them to school, and to make their homes comfortable for them. But still at the same time it was well that they should know how some other people did things, and then try and see if they could not learn something from it. Among the friends of health he did not know of any who were more conspicuous than the little birds they saw flitting about in

the hedges and trees, and who were formerly considered such great enemies. At one time they were considered so bad that they used to be charged in the church rate for so many heads of sparrows which had been killed. But a little inquiry had brought out how very necessary they were for the health of man, because they kept away those noxious insects which would otherwise multiply so fast that they would eat up the crops round about them. In France there was an unfortunate mania to kill all the small birds with popguns and small pistols, and the result of this was that the vines were destroyed by the insects as soon as the birds were gone. Another year they had flies, gnats, and grasshoppers so numerous that the people began to inquire whether it would not be prudent to preserve the birds. In America they found the want of sparrows, and they saw France and Germany sent to England to be supplied with them in order that they might preserve their crops. In looking at the list he found there were a number of useful and

very deserving persons to whom they had given premiums. The President then alluded to each class separately, pointing out the value of good shepherds, teamsmen, ploughmen, and such like, and concluded by saying that in the bishop's present of a Bible they had a proof of the interest his lordship took in the society, and they had before them men who showed no ordinary amount of skill as farm labourers, and men whose moral qualities and religious bearing were such as to make them bright examples for younger ones to follow. He had only to say that farm labourers who really understood their business, who took pains to do that which was right, who were conscientious in the discharge of their duty, whether under the eyes of their master or not, who took a real and conscientious pleasure in doing the thing that was right, strove to discharge their duty in the station in life in which they were placed—such men as these were by no means common, and he sincerely wished they were more numerous.

THE WADEBRIDGE FARMERS' CLUB.

At the annual dinner, when there was one of the largest attendances ever known,

Mr. TREMAYNE, the chairman, said: The ballot will not abolish bribery and corruption, for we have the evidence of other countries to show that there are people foolish enough to give money, and people wicked enough to receive it even for votes that are to be given in the ballot-box. I think it will also lead in a great measure to the virtual disfranchisement of many places, because it will remove that interest which many people now take in politics, for a knowledge that the vote is to be given in an underhand way will induce people to be careless and indifferent about it. But at the same time I believe the ballot will remove that which is the great social blot of our electoral system—I mean that horrible system of intimidation and coercion—that system by which landlords, agents, and employers drive their tenants, their workmen, and those who are in any way connected with them, to the poll, and oblige them to vote probably in exact opposition to the dictates of their own consciences. To my mind there is something so humiliating, so infinitely dishonourable in it, that I think the ballot, objectionable as it is for many reasons, should be tried even if it only remedies that one abuse. Another matter to which I desire to refer is the way in which the landed interest is represented. I cannot but feel that in comparison with the towns the landed interest possesses a far inferior share in the representation. Take, for example, the statistics of this county. There are seven boroughs in it, returning nine members to Parliament, and they contain, roundly speaking, about fifty thousand inhabitants, while the county contains three hundred thousand inhabitants, and returns only four members. And if you take the rateable value of those boroughs and compare it with the rateable value of the county, the discrepancy is still more evident and remarkable, and I think it must be plainly visible to everybody that the county does not possess that full, proper, and proportionate share of representation that the towns do. I hope to see this question of electoral districts taken up early in the coming session by men on both sides of the House of Commons, for I cannot see why anything that will tend to promote fairness, equality, freedom, and purity of election should be treated as a party measure; and I trust that it will be taken up in a public spirit by men who will carry it through for the public welfare.

Sir JOHN TRELAWNY, M.P., said: We had the Irish Land Bill, and I was one of those who thought that the principles of political economy were outraged in that Bill. I was afraid that the consequences might be injurious, but you must recollect that man does not live by bread alone, and that the statesman who leaves out of consideration human feelings and emotions, and merely considers political economy, would not know his business, and would very likely bring the country, into perils and disasters. The Land Bill may not have been right with regard to taking away the power of the landlord to contract with his tenant, but the landlords of Ireland, after all, are not to be so very much pitied when it is found that

the poor fellows can only get in some instances just fifty years' purchase for their land. Things, no doubt, may be said respecting this measure which might make you disposed to receive it with disfavour; but, on the whole, you must remember that the Ulster Tenant-right had been long in existence, and that it was hardly possible it should exist in one part of Ireland and that there should be no desire to adopt it in the other part. For some considerable time previously the question of Tenant-Right had been constantly agitated; bills upon bills were introduced; it was perfectly clear that some measure on the subject must eventually be passed, and when this Bill came upon us for an ultimate decision I could not tell how, under a due sense of responsibility, I could do anything else than give my support to it. You must allow time for discussion, but, at the same time, I do not say that we ought to rest contented very much longer without a settlement of certain questions in which you are interested—I mean as regards the mode of levying and dealing with the rates, so that those who have to pay them may be satisfied that they are dealt with in a proper manner. We have to complain that a measure in that direction has not yet been sufficiently elaborated and passed, although a most painstaking Minister—Mr. Goschen—endeavoured to produce a comprehensive measure. It was not, however, altogether satisfactory to the agriculturists, but if you bring your criticisms to bear upon it I dare say it is quite possible that it may be made the basis of a measure in the next session of Parliament. Sir John then briefly referred to the Game-laws, expressing opinions similar to those which he propounded on the previous day at Liskeard.

The CHAIRMAN, in giving "Success to the Wadebridge Farmers' Club," referred to the usually small attendance of farmers at Chambers of Agriculture.

Mr. R. G. POLLARD said that the agriculturists were constantly charged with being grumblers; but if there were any other classes of the community whose interests were so little attended to as theirs, he had no hesitation in saying that they would grumble with much greater intensity. The agriculturists had to contend not only against grievances that might have been alleviated, but they had also a succession of four dry summers, and he believed that during the last four years the Wadebridge district had suffered more from drought than any other district even in the country. In Cornwall alone, since the year 1868, the loss sustained by farmers in sheep was no less than 38,000, and in Great Britain the entire loss amounted to 3,000,000; consequently things could not have been so favourable for agriculture as some people might suppose, simply because for some time past meat happened to be realizing high prices. Speaking of the best form of agreement between landlord and tenant, Mr. Pollard said the system of tender was most objectionable, inasmuch as it was the means of drawing out fictitious prices and not a fair value. He believed that the system adopted by the Earl of St. Germans and the Earl of Mount Edgcumbe was far preferable, for those noblemen had an estate valued; they put a price upon it, and then looked out for a good tenant to occupy it. A tenant

should have security, and compensation for unexhausted improvements; and much improvement was required with respect to the relations that existed between landlord and tenant. The landlord should encourage the tenant-farmer by the erection of suitable and necessary buildings if the latter laid out his money in the purchase of feeding stuffs, which must be beneficial to both of them. Sir John Trelawny had told them that while the Government had put on four millions in taxes they had taken off nine, but who were the parties that had been relieved? He also told them that nothing had been done for the farmers, but that was a mistake, for something had been done for them, but it was quite contrary to what they wished or desired. Instead of relieving them from taxation, more had been imposed. With regard to local taxation, that was a subject which had been discussed over and over again, and they would never cease discussing it until they had obtained redress. They were quite willing to bear their fair share of the taxation of the country, but when more than their share was imposed upon them it was no wonder that they grumbled.

Why should the agriculturists have to bear the whole burden of local taxation, while the merchants and manufacturers, who were amassing immense fortunes, and who were constantly manufacturing paupers, did not pay one iota for their maintenance? The Club was in a thriving and prosperous condition.

Mr. R. OLVER advocated security of tenure, and thought that their leases at present were drawn up in a most peculiar and unbusinesslike way. He was of opinion that beneficial results would follow the adoption of a plan by which on every farm containing one hundred acres of arable land there should be at least two cottages erected for the labourers who were employed upon it.

The CHAIRMAN had come to the conclusion that no lease was better than a bad one; but he thought that an annual agreement was even preferable to a lease. There was one element required, and that was mutual confidence and good understanding between landlord and tenant. It must be a give and take business.

BOTLEY AND SOUTH HANTS FARMERS' CLUB.

At the January meeting, at Botley, Mr. William Warner in the chair, the subject for discussion was "Root Cultivation, with reference to the best intervals or distances apart for various roots, so as to secure the heaviest acreage and the best quality."

Mr. JAMES WITHERS, said: I may first of all state that it was entirely owing to the prizes awarded for roots by this club and others of similar kind which first led me to think of and to afford me an opportunity of forming an opinion as to the right number of roots required to the rod to ensure the greatest acreage weight. And thus, by comparing one field with another, with their respective numbers of roots, and their weights during a course of years and through various seasons, it assisted me in coming to a conclusion as to the right number of roots per rod to make up the greatest weight per acre. This is evidently one of the best seasons for a plant of all kinds of roots we have had for many years past; and it was possible this season to secure any amount of plants to a given space of ground; in fact, I do not know a season when a good plant of all kinds was so easily obtained. And in taking a survey of the root crop while passing from field to field, and from farm to farm, we might fairly expect to have seen one uniform system carried out with regard to the numbers of various roots, and the respective distances of those roots. This, however, is not the case for great irregularity prevails throughout the whole district. This was occasioned by the hoe in thinning or setting out the plants. I do not, by these remarks, condemn the hoe for this purpose, but, as thinning is necessary, it is also necessary that we should know how far such thinning should be extended. It seems at first sight to be a subject of very little importance, but when we find that some tons per acre are entirely dependent on the right number of roots, it also being often in the power of the hoers to leave any stated quantity, it must be of some importance to know what that quantity should be, in order to produce the best possible crop. At all events, it seems at present a subject very imperfectly understood, or very badly attended to, as within the district of our root show facts prove that the number of swedes vary from 80 to 150 to the square rod, and mangold and other roots quite as much, and also that small or few numbers seldom gained prizes. We will, if you please, first of all fix our attention on the swede cultivation, it being, perhaps, the most valuable part of the root crop. At some early period of our club, says eighteen or twenty years ago, it was often remarked that the swedes drilled at 24 inches seldom gained prizes, their acreage weights being too small, while those with rows of 18 or 20 inches most frequently did so. Experience of late years has, however, proved to me that the reason was not simply because they were placed too wide from row to row, but because the plants were too thinly hoed in those rows, thus leaving about 80 or 90 roots to the rod, where at least 120 or 130 should have been. And as the 24-inch rows now most frequently take the first prizes it must, I think, show to

us that the crop does not so much depend on the width of rows as on the right number of roots to the rod or acre; and it also goes to prove that the 24-inch rows have in past years been too thinly hoed, and if drilled wide between the rows the swedes should be left more thickly planted in those rows to make up the deficiency, or a loss in acreage weight will be the result. The greatest weight found by the judges amongst all the competing fields for prizes within 15 miles of Botley for the last year's root show for ten acres of swedes was a field of my own, which was drilled at 24 inches and 127 roots to the rod. The manure used was 3 cwt. of bone superphosphate, purchased of Mr. Spooner, and 60 bushels of ashes per acre. We sometimes, however, find that excess in numbers will produce a very fair crop; and we also find some cases were few numbers have done the same, and in comparing field with field we seem at time puzzled to ascertain which is right—whether the thin or the thick planting. And although both extremes have at times produced very fair crops, there is a probability that had the medium been adopted there would have been some tons to the acre more in both cases. And neither of the two is in my opinion right, it being better to avoid the two extremes, and follow that which has done the best through a course of years. I have, therefore, come to a conclusion as to the right number of roots, which for early swedes, in my opinion, is from 120 to 130 roots to the square rod, and those of later sowing might be 140. The 24-inch rows, at 12 inches in the rows, would yield 136 roots to the rod, and each swede weighing the small weight of 2 lbs. only would yield 19 tons 8½ cwt. per acre, or root at 2½ lbs. each would be 24 tons 5 cwt. and it is but seldom that we produce that weight. With respect to the numbers of roots I have for the present in my own mind settled that part of the question; but as regards the right way of placing the roots—as to whether they should be 24 inches one way and 12 the other, or 18 inches each way (as both would yield the same number of roots)—I am not so well prepared to give an opinion, but I am inclined to believe the latter would be likely to produce the greatest weight provided the horse-hoe could be used; but as 24 inches is the nearest to ensure good horse hoe cultivation, and we cannot afford to sacrifice the use of that implement, I must as yet give the preference to the 24 inches rows. We will now leave the swede subject, and turn our attention to the mangold. The plant of mangold was, or should have been, a good one, but we find in it the same irregularity of planting, or even greater, than that of the swede, varying in numbers from 80 to 150 to the square rod, and, although the thin planting will produce very fine roots, which catch the eye and appear very beautiful when growing, yet I do not believe that the extra size or weight of such ever compensate for the deficiency in numbers, and, even if they do so, I believe that three roots of medium size would, if analyzed, be found to contain more nutriment than two of the same weight. Moderate thick planting renders the roots more shapely, and are more easily

cleansed and prepared for the cutter, and with much less waste, and the same would apply to swedes and other roots. And I believe that mangold should be grown in numbers very nearly approaching that of the swede. I, however, have not been so large a grower of this root as our chairman and a few other members of the Club, and cannot speak with so much positiveness on this part of the subject. I should recommend the rows at 24 inches and about 14 inches between the plants, or about 110 or 120 roots to the rod; but this root, like all others, should be regulated in numbers, according to the time of sowing—the late somewhat thicker than the early planting. The turnip plant for the early part of the season should, in my opinion, be about the same in number as the swede, or about 130 roots to the square rod. But as the sowing of turnips is extended over a long period, the right number of roots must depend very much on the time of sowing, taking care to increase the number as the season advances, varying from 130 to 200, or even more; and stubble turnips, if hoed, should be from 260 to 300 to the rod, or at the least one to every square foot. I have more than once observed that where only part of a field of stubble, or any late turnips, have been hoed, those left unhoed have produced by far the greatest amount of sheep food, which was the effect of too thinly hoeing. Carrots, if drilled at 16 inch intervals, and from four to six inches between the plants, four inches would yield about 600 roots to the rod, and six inches would be about 400, and I believe 500 roots of carrots to the rod to be about the right number to produce the greatest bulk per acre in most cases. Cabbages and kohl rabi I will leave to others more experienced than myself. We find within 10 miles of Botley the range of our root show for the last season, that the swedes vary in numbers from 79 to 156 roots to the rod, and that 127 was the heaviest of all, and 121 the next heaviest acreage weights. The mangolds vary in numbers from 77 to 151 roots to the square rod, and 89 and 151 were the heaviest. The carrots vary from 400 to 800 roots to the rod, and 575 proved the heaviest. Thus we find there is a very wide scope in practice with regard to the numbers of roots and the distances of those roots; and as the few numbers, or thin hoeing, predominate, and seldom gain prizes, I believe that many or all of us have more or less been guilty of too thinly hoeing for some years past, and this affords me a place to say a word or two on this part of the subject. The hoeing business has very much to do with the root crop irrespective of numbers and distances. The work of both horse and hand hoe should be pushed forward as early as possible, and even in bad wet seasons it will not do to wait. Weeds will grow, and most in wet weather, and are much easier destroyed while in a state of infancy. Too much waiting for fine weather proved the bane of the swede crop in many cases last year which came under my notice; and many a field which promised well in their early stages became choked with weeds and stunted in their after growth, and the hoeing business was also rendered much more expensive from the want of earlier attention. Leaving the largest plants is another thing worthy of our notice. The difference in two men's work in the same field is sometimes very striking; one of whom, leaving the largest plants while thinning or setting out, and the other, regardless of such, more frequently leaving the small ones. This is another evil for which there is no after remedy. It is, therefore, evident that our practice with regard to numbers and distances embrace a very wide scope, and consequently afford a wide field for observation. I have very briefly introduced this subject, and have stated my views on it, and we as men of business should be able at all times to give, if required, some reason for what we practice. That much depends on the right number of roots on the land to produce heavy crops I feel certain, and as there must be among all the various numbers which I have stated some right one, I hope that the members present will freely give us the benefit of their ideas on the subject, in order that we may come to some conclusion as to what that number should be to produce the best results.

Mr. J. BLUNDELL said: Some people outside the Club had said, "Why the subject is very well understood; everyone knows what will be brought forward." Granting that was the fact, he must appeal to them whether, as members of that club, they would exclude the rising generation of young men, who were coming forward day after day as agriculturists, from a knowledge which some of those gentlemen claimed to possess. But they were living in an era when there was always some-

thing new to be learnt, and that was why the subject under discussion was of immense importance. When he considered there were something like 400,000 occupying tenants, he computed that during the last twenty-one years they had had about 20,000 new farmers added to the number of agriculturists every year. Then, if this was the case, why should they wish to deprive these young men of the knowledge which they possessed twenty or twenty-five years ago by shutting out such a subject as the one that day from discussion? Therefore Mr. Withers was to be commended for having introduced it, and he was a man of practical experience, as he had been a judge for several years at their root shows, and in that position they could always learn something. They had a chance of comparing the roots grown, the various methods of cultivation adopted, and learn things which it was always difficult to get hold of without one had practical observation. Coming more closely to the subject, he thought the points they had to look to with regard to the root crop were the distance apart they should have them in order to secure the greatest weight and of most feeding value, and also the hardihood of the crops, in order that they might withstand the great changes of our fickle climate. The all-important point which they desired in the cultivation of root crops, and it was a difficult one, was to learn the number of roots they should save per rod to give them the advantages he had named. Another point was they had not hoers in the present day who would take such pains as those did who were formerly employed. This was a matter of immense importance. With animals so it was with the roots. If they wished to have good animals they would select the best, in order to produce a good stock, and it was just as necessary in the hoeing out of turnips that pains should be taken to leave the best and finest in the rows, so that they might be able to produce a better crop. Therefore it was of immense importance that they should have the right number per rod, and that they should also press on the labourers who hoed the turnips to leave the healthiest in the rows. One question was whether they might not manure the land too highly, and, although they could drive the roots up to 20 or 30 tons by these means, still they might be less capable of withstanding the changes of the climate than others which were not forced by an extra quantity of manure. Mr. Withers had very properly observed that some few years ago they were satisfied with twenty inches between the rows and about 108 to 110 roots to the rod. But if they took twenty inches between the rows he thought they lost the advantage of interculture. Therefore he thought that if twenty-four inches were allowed it would leave 120 or 130 roots per rod. With regard to the turnip crop he would, generally speaking, follow suit with the swedes, and he believed they would have them thick enough if they had the rows two feet apart. Then with reference to the mangold crop they found that the heaviest weighted ones were those which were grown at the greatest distance apart, but he believed the same argument he had used with regard to the swedes would hold good with the mangold. If they had the larger size mangold they would find that they grew very rooty and lanky, and it made it difficult to prepare them for the cutter. He thought if the roots were grown in greater numbers they would be of better quality, although not so large, and thus the same rule would apply to the mangold as the swede. And there was another question with regard to mangold. Some twenty years ago it was proposed to give a prize for mangold sown late, and it was decided that they should not sow until after the 6th of July. That for a number of years was adhered to, and with very great success. He remembered taking a prize with some which weighed twenty-six tons to the acre, and they were of very good quality. The question was whether they could not have a good crop by sowing late as well as early. He had been told by a gentleman in the neighbourhood that he had been feeding his sheep off mangold which had not been injured by the very severe frost we had at the latter part of the year. Thus it struck him very forcibly whether they could not grow mangold of sufficient hardihood to withstand the changes of the season. There was a system by which he thought they might be able to do this. With sugar-beet they had to cover up the roots in order to preserve them, and as it was well known that the part of the root which was under the ground was of more feeding value than that which was above it he saw no reason why the mangolds should not be covered with earth. If they followed this and earthed them up he thought mangold might be left in the field with impunity to stand the chances of

the winter. He did not say they could do the same with swedes, but the mangold had a far higher value. They knew very well if the swede was frozen in the bulb it lost in quality. He did not think the same rule would hold good with the mangold, and he thought if they were earthed up they might leave them in the land with comparative impunity. The distance apart for the cultivation of cabbage was an important point. He thought they should allow a sufficient space between the rows to admit of inter-culture; for all sorts he should say two feet between the rows, while the smaller ones could be varied in the rows. They could be placed eighteen inches apart, and yet they would have a valuable crop. With regard to carrots they could grow them even if the soil was out of chalk. Then there was the distance, and a most important thing was to keep them clean, which was very expensive. He would take the same rule of two feet between the rows. He attached great importance to carrot cultivation, as he tried an experiment by excluding swedes on his farm for six years, and he grew carrots as the main food for his stock. And he would tell them that the earlier period for sowing them was wrong. He maintained that the 1st of May was the best time, and was much better than the last week in March or the first in April. And it was for this simple reason—that carrots would not vegetate and come forward unless the weather was sufficiently warm. Then, with reference to the number of roots per rod, Mr. Withers had spoken of 400 to 800. He remembered in Mr. Croskey's time, when he rented a farm of Mr. Gater, he not only had 900 roots per rod, but they were also of good average weight. Then came the question of cultivation, as they could not get the horse-hoe in between them, and then it also required a number of people to dig them up. He very well remembered that when he grew carrots his number generally used to be something like about 250, and then he had the advantage of inter-culture and a very heavy crop of large roots, while he did not have to throw away money by employing a lot of persons to dig them. He could not see a better plan than to grow them at wide intervals, and have about 250 roots per rod.

Mr. JOHN WITHERS had had much practical experience on the subject, having been one of the judges, and he agreed with what his brother had stated in his paper.

Mr. JAMES WARNER had also been one of the judges at their root show, and had therefore some practical experience in the matter. He thought it was of immense importance that they should endeavour to secure, not only as last year but continually, a succession of good root crops, whereby they might secure to the kingdom a large and good supply of meat, for according to the quality of the roots so in a great measure would the price of mutton and beef range. Speaking more in connection with the subject, Mr. Warner said he agreed in a great measure with what Mr. Withers had adduced, as two feet apart would secure a better cultivation of the land, but for his own part he thought that swedes sown eighteen inches apart in the drills and twelve inches in the rows would produce greater weight than if grown two feet apart and thicker in the rows. However, it was quite requisite that a man should use his own judgement in the matter, and act for the best according to the circumstances in which he was placed.

Mr. W. B. GATER said he at first thought the subject had been worn very thin and was become almost threadbare, but since he had heard the able paper of Mr. Withers, and the practical remarks of Mr. Blundell, he could find that there was some advantage in having the matter again brought to their notice, and that much new light had been thrown upon it. Much depended on the careful eye of their labourers in hoeing, and with regard to the distance he thought the medium was to be preferred rather than the extreme of either the width or the closeness between the rows and the plants. There were cases when the cultivation should vary, but this was the exception rather than the rule.

Mr. SPOONER said: With all due deference to the opinions expressed by those outside, he thought the question was a very practical and proper one to take up. His object in getting it brought forward was to see whether, by eliciting the opinions of those who were competent judges, they could not come to a conclusion on the extremely difficult point as to the proper number of roots per acre. It had been held that a smaller number should be left, but Mr. Withers was generally in favour of a larger, and he (Mr. Spooner) was never more struck with this idea than when he considered the large number of roots that were destroyed by means of the hoe. He could not give

them a better illustration of this than by relating what took place with regard to some plants of his own. He had a small piece of swedes of about two acres, and he certainly never saw a finer lot of plants, there not being a single foot of the drills but what contained a swede. He therefore thought that they would agree that here there certainly should not have been any deficiency. But this was not so, however, and they were diminished by a large number by the manner in which they were hoed. In going round the field he began to count, and there were intervals of eighteen inches, and in a number of places two feet, without a single plant. Now, he knew how this came about, as he had gone over the field himself, and he could say that there was not an interval of six inches without a plant, and therefore it was self-evident that a large number had been destroyed by means of the broad hand hoe so generally used. Nothing could be more convincing than this. The men thought they had left plenty of roots no doubt, but there were only enough to give twenty tons per acre. The deficiency was quite seven or eight tons, and this was caused by the reckless hand hoeing. With regard to mangold he tried a piece with half a dressing of dung under ridges, with some artificial thrown over broadcast, and men were furnished with a stick fifteen inches long so that the seed might be dibbled in at that distance. In the ordinary state of things he anticipated that it would have produced something like 100 roots per rod, as they were planted at intervals of twenty-seven inches between the rows. After the hoeing there were but about 80 roots per rod, and about 33 tons per acre, but he thought the judges would agree with him that if the proper number of roots had been left in there would have been five or six tons more per acre.

Mr. JOHN WITHERS: Quite as much as that.

Mr. SPOONER: With regard to carrots he thought they ought to have four times the number of roots per rod than mangold. He drilled in his carrots twice in a place. The rows were about a foot apart, and he believed produced upwards of 500 roots per rod, and 28 tons per acre. He thought hand weeding for carrots better than hoeing. At any rate his were not hoed. He believed about 110 roots of mangold per rod and about 450 of carrots would be something like a legitimate number. Of course there was an objection to placing carrots at close intervals, as there was the expense of weeding them and getting them up. He did not think, however, much of the expense of weeding as that of getting them up. He thought kohlrabi should be left thinner than swedes. He was talking last Saturday to a large root grower in Dorsetshire, and he was a strong advocate for having them thick. In Scotland he also observed that in very many fields the turnips were twenty-eight inches apart in the rows, yet there they grew quite as many roots per rod as in England, and he believed this accounted for their having such remarkably good roots, and especially swedes. He believed Mr. Withers was quite correct when he said that by having the roots thicker in the rows they could have a proper number per rod, and consequently a better weight per acre. He thought if more attention was paid to the cleaning of the crops and a more careful hoeing it would be very beneficial. Whether it would be better to employ women and children in the first instance he would not say, but he believed it would be more desirable to have the plants hand weeded rather than that thousands of plants should be destroyed through the negligence of the labourers in their desire to earn a little more money. They found that the past season had been favourable for large roots, but that these did not come from the places where there was a large acreage—only from the spots where there were a few roots. They seldom came from where the acreage prizes were won. He might mention that last year they had as much rain in the three months which were so conducive to the growth of roots as they had in any other six months. The rainfall had been about thirty inches—about six inches in the other quarters, and twelve inches during the months of August, September, and October. The last two months particularly it was excessive. He did not mean to say but that the root crop might have been better with less rain, but it showed the importance that there should not be a long interval with out rain. With reference to mangold he believed that the manure should not be close to the seed, but with the swede it was different. He believed the subject they had discussed was not only of interest to members of the Club, but it was also of importance to those who were outside and the community in general.

The CHAIRMAN thought the paper and the remarks which had followed it had shown that the subject was not so fully understood by all as it had been made out, and that when the roots had been left in the hands of the labourers it had often turned out unfortunate for them. The year before last he was very much dissatisfied with his root crops, and he determined not to allow his men the use of the broad hoe. He sent into Southampton, and had some made varying from five to seven inches, and he made his men use them. He had gone into a calculation, and he found it would be much more desirable that the roots should be left thicker. Some rows were left eighteen inches and others two feet apart, with less intervals between the plants. Probably the roots left at eighteen inches would produce the heaviest crop, but a great deal depended upon the cultivation, and he thought, as being a fallow crop, there was an advantage in the two feet distance. By this they had the advantage of cultivating the soil and of keeping the crop clean. He quite agreed with Mr. Withers that the planting of mangolds and swedes the distance apart he had named would produce the heaviest crop and also the best quality. They all knew mangold was a very greedy feeder, and therefore if they gave them too much manure and space they would deteriorate;

their object should be to distribute the manure so as to have not only an average weight of roots but also of good quality, as he thought that was the principal thing they desired with reference to the root crop. Mr. Blundell had alluded to the growing of mangold which should stand the winter. In sowing mangold to stand the winter they should take care that the plant should be able to retain its feeding qualities, and therefore they should be careful as to what manure they used.

Mr. JAMES WITHERS having replied, the following resolution was submitted and agreed to unanimously: "That in the opinion of this meeting, in order to secure the heaviest acreage of roots and of good quality, it is desirable to leave a larger number of roots per rod than is usually considered sufficient; that swedes may be recommended to be grown two feet from row to row with intervals of 12 to 14 inches between the plants; that mangold may be grown two or three inches wider in the rows, and turnips somewhat closer, according to time of sowing, whilst carrots should be left about four times as thick as mangolds."

Votes of thanks to Mr. James Withers for his paper, and to the Chairman, were passed.

STAINDROP FARMERS' CLUB.

At the annual dinner, Mr. T. F. Scarth, president, in the chair, Professor WRIGHTSON delivered an address on the Obstructions or Hindrances to the Development of Agriculture. He said:

I propose to treat this subject briefly, and at the same time, to touch upon the most important obstructions which retard the progress of agriculture. No one disputes that agriculture is developing rapidly in this country. Our knowledge, our appliances, our live stock are all improving and extending, and this is frequently made a matter of congratulation when landlords and tenants meet. It is not in these particulars that the shoe pinches. Agriculture is a growing child, rapidly becoming too large for his clothes—or, to use another simile, a vigorous duck which must break the snell which has hitherto cramped her. I am not in the least afraid for Agriculture, if fair play is allowed her; but so long as a dependent and trammelled tenantry exist, so long shall we have knowledge and appliances contending in vain with what may not too harshly be termed obsolete feudalism. Never will the agriculture of this country be fully developed until the same principle is adopted in the country as has already become the rule in towns. Towns are the centres of civilization. It is there that intelligence is sharpened by keen competition and the constant intercourse of men with men. It is from the towns that enlightened views find their way into the country. Let us, therefore, endeavour to secure the same liberty in the country which is already enjoyed by the townspeople. Landlord and tenant, master and servant, are words of old standing; but every year they are altering in precise meaning, and ideas of feudal superiority must eventually wane and vanish. Whether you approve, or whether I approve, of the change are small matters. The peculiar tendencies of the age, more or less democratic in their character, are progressing with irresistible force, impelled by causes over which we have no control, and I trust for the general well-being of the community, if not of every class viewed separately. Liberal ideas, with regard to every relation between landlords and tenants, have been gaining ground of late; but there are objections urged by the more Conservative section of the agricultural community, which are worthy of attention. First, there is the general and right feeling that the landlord's interest must be considered as well as the tenant's interest; and this is perfectly true. No system of tenure, or Tenant-Right, ought to interfere with the legitimate rights of property; but, at the same time, no laws of property should be tolerated which exert a decidedly injurious effect on the community at large. Nay, further, where the good of the public is involved it may, as in the case of railways, water companies, thoroughfares, nuisances, &c., be advisable to control and curtail the powers of property owners. To my mind, no doctrine is more dangerous and ungodly, than that a man has a right to do what he will with his own—independent of the consequences to others.

Happily we are becoming more enlightened, and we are learning that property has duties incumbent upon it as well as rights. With regard to the subject before us, let us take a rapid glance at our rural economy. England is the theatre of wonderful agricultural activity, and its landed economy, lying as it does at the foundation of all relations among agricultural classes, must be worthy of attention. First, then there are the landowners holding, in comparatively few hands, the greater part of the land of the country. Next, we have the tenant farmers occupying the land and supplying the capital necessary to work it. Lastly, the labourers, upon whom devolves the actual tillage of the fields. The estates of the landed aristocracy are so extensive, that the idea of their owners cultivating them is precluded; and unless legislative acts, directly interfering with the accumulation of large tracts of land under one owner, are passed, we must allow that the lands of England will continue to be farmed by tenants. Now I hold that the nation, as well as the farmers, have good right to demand that this inevitable division of capital and labour, represented by the relation of landlord and tenant, should be so arranged that the produce of the soil should not be thereby diminished. They have a right to ask whether, in the present state of the law, any serious obstructions exist in the way of good cultivation, and, if so, whether the difficulties in the way of removing such obstructions are insuperable? I unhesitatingly answer there are still in force antiquated laws and vexatious customs which tend to keep men of capital out of agriculture; to limit the amount of produce, and to depreciate the value of landed estates. Without, therefore interfering with the legitimate rights of owners, it would be well to take into consideration the rights of occupiers, since it is to them the nation must directly look for its supply of food. I have written down nine serious difficulties with which the British farmer, and with him the consumer, has to contend, and I think it is of especial importance that the sympathies of the consumer should be enlisted on our side. 1st, insecurity of tenure; 2nd, want of proper compensation for unexhausted improvements; 3rd, want of capital both among landlords and tenants; 4th, want of sufficient education on the part of farmers; 5th, game; 6th, entail, primogeniture, and, in general, the state of our land laws; 7th, the condition of the labourers; 8th, the relations with the landlord, political and otherwise; 9th, the law of distraint and hypothec.

INSECURITY OF TENURE.—Could anything be more unsatisfactory to a manufacturer than to work under a six month's notice to quit, and liable to the confiscation of a very principle portion of his capital? Such is, however the condition of the farmer. As a consequence, he takes care to so employ his capital that he can withdraw much the greater part of it within a very short time. This is one of the chief causes of so much bad farming, the occupiers not being so foolish as to undertake improvements requiring years in order

to realise them. This is why men of capital look coldly on agriculture as an investment of capital; why men of energy, with a sense of commercial freedom, seek town rather than country occupations. I am in favour of a lease, and I believe north countrymen as a rule are so. Still, we find many good agriculturists in the south of England opposed to leases as favouring an "up and down" system of farming, and as not being demanded by farmers; many farmers being, it is said, averse to taking a lease when offered to them. If you have not a lease you must have a longer notice. A six months' notice is too short, and a one, or even a two years' notice would be more in accordance with the length of time required to complete and realise farming operations.

TENANT-RIGHT.—Although you will find many experienced men opposed to long leases, you will find wonderful unanimity with regard to Tenant-Right, or the adjustment of claims between the landlord and the out-going tenant, whether in favour of the former or the latter. The principle of compensation is allowed on all hands, and we have only to glance at the customs of the various counties to see that a Tenant-Right is slowly making its way. Many counties, however, have no such customs, and in scarcely any is the system of compensation complete or consistent with scientific knowledge. What we want is a short Act of Parliament, legalising and compelling Tenant-Right, stating that when a tenant quits, he is entitled to receive a sum equivalent to the value of the capital he has sunk in improvements not yet realised by him, but which his successor, or the landlord will enjoy. The details of a Tenant-Right system need not detain us, but if the principle is acknowledged by Government, each district will be able to frame a code of rules for every contingency, and practical men will be found ready to act as valuers in adjusting the rival claims. Farmers are, however, too dead to their own interests to move in the matter. Can they not even get up a petition for a Tenant-Right Act, to show that they take some interest in the matter? Why should you not take the initiative in asking for the co-operation of Chambers of Agriculture throughout the country in forwarding so desirable an end?

WANT OF CAPITAL.—There is a sad deficiency of capital among the cultivators of the land in many parts of this and the adjoining counties. Perhaps I had better include the whole country. Capital is proverbially timid, and, this being the case, it is not to be wondered at that it should keep out of a business in which profits are not very large, and in which the restraints imposed by landlords are so stringent. Still, we find no lack of capital over large districts, and I believe we shall find it circulating freely in proportion as it is made secure to the capitalist. Want of capital is not only a tenant's, but also a landlord's weakness. Landlords are often spoken of as poor; their estates being burdened by liens of various kinds, and a policy of entails, settlements, and primogeniture, calculated to keep up the dignity rather than the money prosperity of the tenant-in-tail. The following anecdote has been related, in order to show the advantage of abundance of capital: A farmer, who was doing very badly both for himself and his landlord, was horrified by finding his rent raised and half of his land taken from him in one day. The story, however, proceeds that, in spite of the loss of land, the farmer became a prosperous man on the smaller occupation, thereby teaching all around him the advantage of plenty of capital per acre. Equally true would the same principle be with many landlords, who, were they to sell a portion of their estates and improve the remainder, would increase the value of their estates, and become benefactors to their country, instead of the opposite.

WANT OF SUFFICIENT EDUCATION.—Want of education is among the chief obstacles in the way of agricultural improvement. It is not in business knowledge that the want of good education is most evident among farmers. They are, as a rule, very shrewd in conducting their business; but, at the present day, when so much scientific knowledge is brought to bear upon agriculture, the farmer should be acquainted with the principles upon which his practices are founded. Agricultural literature is badly supported; and yet, I can only say that a single number of the *Agricultural Gazette*, *Mark-Lane Express*, or, in fact, any good agricultural paper, contains a mass of valuable information, which the money-making farmer cannot really afford to lose. Look also at the journals of the Royal Agricultural, the Bath and West of England, and the Highland Agricultural Societies. Their volumes are replete with calculations, estimates, results, opinions, and facts, written by

men whose names we all respect; and yet, from all I hear and observe, although these articles have been written with ability, they are passed over with indifference, and although embodying much labour, both in investigating and writing, they are not considered worth perusal. Then again, look at what a good agricultural library ought to contain at the present day. Books on the practice of agriculture; books on agricultural chemistry, botany, geology, entomology, and zoology; on live stock, buildings, and implements; on landlords and tenants; on agencies and law of the farm; on valuations; on foreign and colonial agriculture, &c., &c. I say that while, as at present, these works are dead, so far as farmers are concerned, there is every reason to wish for improvement. Still more disheartening is the want of education, when viewed from another aspect. It is the chief cause of the isolation which is so fatal to the agricultural community. Where is the farmer, I ask, who knows by name even the eminent men at present labouring in his own occupation? I do not believe they are known among farmers so well as they are among landlords, agents, and the public generally. In the same manner our progress in contiguous and remote counties is not watched with any interest. Struggles with unjust landlords, on account of game or politics, provoke but little remark, save in the newspapers, and their note is not re-echoed in farming circles; great movements, set a-going by our Farmers' Clubs and Agricultural Chambers, find but feeble response, even where they directly touch the farming pocket. Local-taxation, Tenant-Right, Malt-tax, regulations for preventing the spread of cattle diseases, all fall about equally flat, and fail to draw farmers together. This I have frequently noticed and deplored. Why, I have asked, do you not come to the Chamber of Agriculture meeting? The reply is generally that they do not see the use of it—that it can all be read in the newspapers. This, I need hardly say, is the height of folly, and points simply to the fact that education is wanted for the farmer. At this day agitation is everything. Game would not remain in the hands of the landlords a year if the farmers really felt about it as they appear to do, judging from the speeches of their leaders. Local taxation would be at once adjusted, were the county members confronted by an intelligent and earnest constituency. Tenant-Right and security of tenure could not be refused to an educated body of men with money in their pockets. Then, again, look at the advantage which a sufficient amount of education gives to a farmer in treating with his landlord or his agent. All these considerations point clearly to one conclusion, that were farmers educated, intelligent, alert, and more in harmony with the times they live in, all these other obstacles mentioned, or yet to mention, would speedily disappear.

GAME.—I do not think anything has really stirred farmers to the same extent as the game question. More crowded meetings, and more vociferous declamation has been held respecting it than any other topic of agricultural interest. The game grievance is often a heavy yoke upon the farmer's neck, and under existing relations it is always liable to be so, should the landlord become a game-preserve. The law takes it for granted (and here I speak under correction) that the game is the tenants unless it is especially reserved, and it is difficult to see what more could have been done to secure fair play. The tenant, however, first allows the reservation to be made, and afterwards bemoans the hardness of his lot, as the occupier of a game preserve. This, at first sight, seems unreasonable, but when we consider the whole case, we may come to a different conclusion. There is the element of competition for farms on the one side, and the monopoly of land upon the other. The result is, many applicants for one farm, and agreements are accordingly drawn up, which although apparently expressing the wishes of both parties may, and often are, really in favour of the landlord. This being granted, we are next told that such a state of things is natural, and that you cannot interfere in the matter of private contracts by means of legal enactments. It must, however, be evident that this assertion does not close the question; for if the tenants, as a body, are so injured by the over-preservation of game that their functions as food growers are interfered with, then the nation may properly interpose, and rule that the tenants should be freed from the liability of annoyance from Game-laws. This is a very grave question, and demands settlement. Could the requisite public spirit, or public opinion, be raised among farmers regarding the game question, I feel convinced that it would lead to a much more satisfactory solution of it than

any Act of Parliament can effect. It is, however, so difficult to obtain this expression of opinion that, if dealt with at all, it will probably be by law, and that at no remote period.

ENTAIL AND PRIMOGENITURE.—The first of these results in nominal ownership. The life-tenant not being an allodial or free owner, he is, therefore, unable to sell his land, and is fettered with regard to the privileges belonging to full proprietorship. Entail also encourages the accumulation of property in few hands, which needs no encouragement, but rather regulation. Primogeniture will probably be legally abjured shortly. Not that it is likely that a man will be obliged to divide his property, but rather that if he dies without a will the law will assume that he meant to make an equal division among all his children. At present the law assumes the father's wish to have been that the eldest son should have the land. This is a relic of feudal times, when, on the death of the Crown tenant, the fief reverted to the Crown, and was then usually conferred on the eldest son as successor to the last tenant. As the feudal system fell into disuse, the Crown ceased to exert any active power, and the estates were customarily handed down in the line of the eldest males. The effect of abrogating the law of primogeniture would be moral rather than legal. A father would be just as much empowered to leave the whole of his estates to his eldest son as ever; but, in doing so, he would have to execute a legal will, disinheriting his other sons. In other words, he would have to act more harshly to his youngest sons than the law would have done had he died without a will. The effect of primogeniture upon agriculture, must, on the whole, be prejudicial, because it is not likely that a father will be inclined to still further improve the already too large inheritance of his first born. He is more likely to try and save something as a settlement for his younger sons and daughters. The whole subject of our land laws requires reviewing, and the nearer we return to free allodial ownership the better, so that land may be purchased as easily and with as little cost as railway shares, and cease to be a singular property, the complications of which seem chiefly useful in maintaining lawyers.

THE CONDITION OF THE LABOURER.—This is, no doubt, a difficulty in the way of agricultural improvement. In the late Franco-Prussian war, education was found to exert a wonderful influence in making the German troops effective. I look upon this as a remarkable fact; for, if education is powerful in causing masses of men to act better, when under the thorough command so essential to success in the battlefield, and when discretionary power is certainly reduced to a minimum, how much more will it be effective in making men better shepherds and carters? I believe in education, but also in good wages and good cottages, as the very principal means of improving the condition of the labourer, as well as the cultivation of the ground. The actual condition of the agricultural labourer, although improving, calls loudly for amelioration. Were landlords and farmers as careful to provide proper sleeping and living accommodation for their farm servants as they are for their horses, we should soon see a wonderful improvement both in moral and physical development. The landlords, under present relations, are responsible to a much greater extent than the tenants for cottage accommodation. If farmers were more alive to the importance of a well-conditioned peasantry, they would put more pressure upon the landlords, or offer to do the work of building, provided they received a proper compensation upon quitting. This is an urgent matter, since it is every day directly affecting the well-being of millions of our fellow-countrymen; and since there is no prospect of either landlords or tenants setting to work generally to provide sufficient cottages for labourers, we shall probably have interference from head quarters.

POLITICAL AND SOCIAL RELATIONS WITH THE LANDLORD.—These are too feudal in their character. They assume inferiority on the part of the tenant, and benevolence on that of the landlord. Here, again, the isolated tenant must bend to circumstances, but the general body of tenant farmers should rise to a higher sense of their position in the country. It is difficult at present to see how a tenant can safely vote against his landlord in a general election; but I believe that coercion will cease so soon as farmers assert their right to independent action. You may perhaps ask what this political aspect of the tenants' relations has to do with agriculture? I can only reply that the more dependent the position of a tenant farmer is, the less eager will men of culture, of capital,

and of intelligence, be to enter farming as a business. It must be a grievous thing for a gentleman who wishes to farm rather than to enter the army, the church, or some other profession, to be confronted with the fact that, as a tenant, he will be liable to the depredations of game and game tenants, bound to certain political opinions, and oppressed with a sense of feudal inferiority.

THE LAW OF DISTRRAINT (HYPOTHEC).—This law, which gives the landlord a decided preference above other creditors, is blamed for injuring the credit of tenants among the tradesmen among whom they deal. It also is said to encourage a class of tenants without capital, who are only tolerated by the landlord because he knows that, however other creditors may be paid, he at least is safe to get twenty shillings in the pound. On the other side, it is held that the abolition of these laws would be ruinous to many farmers who are now struggling with adverse circumstances, and are yet, owing to the operation of the law, able to hold their farms. I have now laid before you some of the chief drawbacks to agricultural development. I have attempted to treat the subject in a truly liberal spirit, and to advocate a policy calculated to encourage the flow of capital into agriculture. My views may be thought too advanced for the present class of tenants, and I grant that there are large districts in which more freedom to tenants than they already possess is not desirable. I, however, hold that it is the place of those who speak on such subjects to advocate views rather in advance than behind the times in which they live, and to look upon the able and intelligent tenants of good agricultural districts as representing the farmers of the country, rather than poor and ignorant occupiers in benighted districts, who are yet years behind in their practice, and comparatively ignorant as to theory.

Major COCHRANE said they all admitted that the tenant had not security for the outlay of capital, and if that society had to be useful, they would exert themselves to make such changes as were called for. It would be a benefit to the landlord as well as to the tenant. It was not to be supposed that men would risk their capital until they had better security. He thought the questions affecting the farmers might be divided under three heads; that they should have a proper knowledge how to invest capital; that proper security should be afforded to tenant farmers—leases had been named, but he was not an advocate for them; and the question of game. This latter question, he thought, should be a matter of arrangement between landlord and tenant. With reference to the law of primogeniture, he thought it had better be left alone. They would prefer being under large landed proprietors than small ones.

The Rev. H. C. LIFSCOMB demurred as to the want of education amongst the farmers and labourers of this district.

Mr. WATSON said it was the result of persons introducing complications into their business that they had to call in legal aid to get out of their difficulty.

Mr. GRAHAM said compensation to tenants would be very valuable if it could be brought into working order; but he was afraid it would operate so that the good tenants would get nothing, and the bad tenants a great deal. Education was not so low as represented, and all agricultural periodicals were well supported by the farmers. With reference to the game question, without entering into it, he might remark that the game eat a deal more food than it supplied.

Mr. MIDDLETON supported Mr. Wrightson's views.

Mr. D. NEESHAM urged the necessity of security, which would be beneficial to both tenants and landlords.

Mr. HAWDON said if compensation were given for drainage, hedging, and road-making, he did not know that they would have much to complain of, especially if notice to quit were extended to one or two years. They, as a rule, had no objection to their landlords killing game; but they had an objection to their letting it to hucksters and gentlemen, who killed the game and sold it to dealers, taking what had been fed on their lands for their own profit.

Mr. ABBES supported Professor Wrightson, as did Mr. Broady.

Mr. BELL objected to leases, and thought landlords and tenants ought to be sufficient to make a bargain.

Mr. W. F. SCARTH thought there was great need of education amongst farmers as pointed out by Mr. Wrightson. He thought that the question of security would be best dealt with by simple agreement at the present time.

THE HEXHAM FARMERS' CLUB.

THE LAND QUESTION.

At another adjourned meeting for the purpose of resuming the discussion on a paper read by Mr. Thos. Bell, of Hedley Hall, on the relative interests of landlord, tenant, and people in the soil, Captain Nicholson, in the absence of the president, Mr. C. G. Grey, presided.

Mr. MARSHALL, in opening the discussion, said that although he agreed with the principle of Mr. Bell's paper, he did not think that it could be carried out practically. He believed that something in the form of a lease and Tenant-Right could be much more easily managed. He knew that there were many objections made to this, and perhaps if these were more fully stated they would be more patent. So far as he could see he could not go the whole length Mr. Bell went in his paper, though he considered that the principle was right that the tenant should have some compensation for unexhausted improvements. They must not forget that the improvements a tenant made were very seldom permanent improvements; they might be so-called permanent improvements, but they must be followed up by good farming to make them permanent. Mr. Bell endorsed Mr. Gladstone's opinion that whatever increased the lettable value of the land was worthy of compensation. To some extent that might be true, but the landlord must have some say in that matter, and if he did not desire to have his land improved the tenants ought not to have compensation for it. He thought they could hardly follow out this principle to an extremity without reducing it to an absurdity. He reiterated that he agreed with the principle of compensation for improvements, but he could hardly follow it out to the extent it seemed to have been followed out in the paper.

Mr. THOS. DRYDEN remarked that the subject was such a wide and far-reaching one that he scarcely felt competent to grapple with it sufficiently, and it was hardly possible for anyone without deep thought to probe its bottom. In seconding the motion for the adjournment, it was not with the wish of having an opportunity of speaking upon the subject, but to give Mr. Bell an opportunity of replying to any arguments that might have been adduced in opposition to his paper. The question was as to the relative interests of landlord, tenants, and people in the soil. Taking the people's interest first, he held that the people had a right to have the soil properly cultivated, a matter which he thought was admitted on all hands. The landlord, as owner of the soil, had many duties to perform, more than perhaps any man could perform as he would wish to do. It was a wrong idea, and one which was often used, to suppose that a landlord had the right to use his land for pleasure and sport and not for the good of the community at large. It was a weak point to say that owners would not live on their estates but would spend their time elsewhere unless their pleasure and sport were provided for, but he was sorry if landlords used that argument for the preservation of any of their privileges. He would like to see the landlord have a large opinion of his duties and seek to perform them accordingly; to see that the land was properly farmed and produced all that it could, not only for his own interest, but for the interest of those beneath him. He would then keep the confidence of the country, and the respect would be paid to him that he would like to see paid to him. This was a question which would be more looked into in these days of education, when everything would be sifted to the bottom, and if found wanting objections would be taken to it. Then as to the game question, referred to by their president at a previous meeting, who said he would make game property, but they were here to-day and gone to-morrow, and to make them property would savour of communism, and he could not see the justice of that at all. It was probable that there would soon be an alteration in the Game-laws, but it was his opinion that if the landlords would agree to the abolition of ground game it would put the question at rest for a considerable time. If landlords would only agree to that, it would shelve the question for a time if not altogether. He liked moderate views, and when things

were carried out with moderation it was best for all parties. In order to have as much food produced as possible there ought to be a lease and also compensation, for land would never be properly kept up to a high state of cultivation; in fact, it would be unwise for a man to farm heavily without proper security. A lease without Tenant-Right naturally resulted in an "up and down" system of farming, unless the farm was re-taken some few years before the lease ran out. A lease combined with compensation he regarded as the only means for securing the proper cultivation of the soil, so as to produce the most food for the community. They must not look upon this matter as simply a landlord and tenant business—they must take a more enlarged view of it as food producers for the community at large. As to the labourers, they should see that they had good cottages so that they might live in comfort, and as to the transfer of land he thought it might be simplified a great deal. On the general question of Tenant-Right and compensation, he believed that it would lead to improved cultivation, to increased production on every land, and to greater contentment of the community, when they saw that everything was done that could be done or ought to be done, and it would be the means of preventing anything of a revolutionary character. If, on the other hand, the community saw that the soil was not used to the best advantage, and was used for other purposes, it might lead them to desire a state of things which they might now consider visionary and even foolish. Objections had been taken during the discussion to their entertaining these theories on the land question. In Parliament many things were talked which might not seem very practical, but something practical was brought out of them. These theories were the germs of thought, the thinkings of men, and might result in something practical, and ought not to be speedily condemned as they were by some. Any innovation, whether in politics or mechanics, that had gone forth, had at first sight been laughed at, but in the end something had been produced for the good of mankind. He thought they ought to weigh matters carefully. There seemed to be some difficulty as to what was proper compensation to a tenant for his interest in the soil, and perhaps there might be some difficulty in getting a scheme that would fairly meet the claims of all parties. However, if they approved of the principle, he had no fear but that a proper scheme would be worked out. He should like to propose some resolution, so as to draw forth the opinion of the Club on the matter. His resolution would be to the effect that this club, recognizing the right of the people to have the soil properly cultivated, is of opinion that in order to effect this a lease and Tenant-Right for the farmer seemed indispensable. He thought that this would benefit all classes; for, if the people of the community were contented and prosperous, then, of course, all classes must of necessity be so. The president thought that the importing of food did not impoverish the country. It was true they could bear the strain; but if they grew the food without importing it they would be more wealthy. Being so rich in manufactures and commerce, they were able to bear that strain, but it would be wise to farm as well as possible, and to produce as much good as possible, for things might change, and it was right in principle that a country should produce in its own soil all that it possibly could. They heard a great deal about the increase in the value of land, and in return for this increase, obtained without any industry on the part of the owners, land ought to bear the heaviest portion of the taxation. As he had already said, land increased in value without any industrial efforts on the part of its owners, and the industrial classes, whose labours increased the value of the soil, ought not to bear that taxation, but the landowners. It was very unfair, if there was a change in the taxation during the tenancy of a farm on a lease, that the tenant should be called upon to pay the additional taxation. His opinion was that the taxation should fall upon the owner, and not upon the tenant. He could not but see that land should bear the

greatest share of taxation, and also local rates; trade might fail, it was not real, but the land was always there.

Mr. J. W. WILKINSON thought that they would all agree that Mr. Bell had laid before them a paper which had attracted a great deal of attention and opened up a wide field for discussion, and all the more so as it aimed at creating such a tenure of the soil as would attract to it that capital which would fully develop its resources. But what changes were necessary? Had they to have a system of Tenant-Right, and what kind of Tenant-Right ought it to be? The Irish system of Tenant-Right had been referred to, and some were in favour of having such a Tenant-Right in this country, but he thought the Irish system of tenure was different to theirs. At any rate, the Tenant-Right had not made the Irish tenantry more loyal, if it had made them more prosperous. In Ireland, there were many instances of farms being in a miserable state of decay, and the landlord seeing no chance of any increase in rent had no interest in laying money out upon it. If they had a stern law to take the property out of the hands of the landlords, he did not think they would be placed in a much better position, although he could not but agree with the remarks that had been made as to the present tenure not being of such a kind as to attract capital to it. If proper security was given for capital invested in the soil, farms would be better cultivated and there would be a larger production of animal food. These ideas had got abroad among the lower classes, and it would require something to be done, or the matter might be taken in hand in a mere radical manner. Suppose a tenant increased the value of his farm £100 a year, what portion of such increase would be the tenant's and what portion of it the landlord's? Another system of Tenant-Right was that the tenant should be paid for unexhausted manures, cakes, &c., at the end of the lease. Which system was the best, that in which they received payment for manures, &c., or that in which they received the capitalised value of the farm? Giving payment for manures, cakes, &c., at the end of the lease, might tend to the improvement of the farm, but in a general system of good farming from the beginning to the end of the lease the small amount that the tenant would receive for manures, cakes, &c., it would scarcely pay him. He wished to remind them, however, that in discussing this subject, they should endeavour as much as possible to keep up the good relations that existed between landlord and tenant. They were apt to condemn communistic views in others, but in dealing with the land question they should not carry them out themselves. They should approach this question in a way that might lead to some satisfactory settlement by mutual arrangement rather than by Act of Parliament. He had no doubt but that the whole of the game and land laws would come before Parliament in a bundle together, but they could not deny the rights of the owner of the soil to a certain extent, and if he chose he might farm game or anything else. What they wished for was the tenant to have some guarantee that he would reap the reward at the hands of his industry, and to make the tenure of land such as would attract capital into the soil and bring it into a higher state of cultivation. He thought it was to the interest of the landlord to have his farm left in a proper state of cultivation. If the Club formed any resolution calling for a more satisfactory settlement of the land question, he would be in favour of recommending it to the notice of the landlords, but he was not in favour of Parliamentary interference, which he considered would not be altogether satisfactory to either of the parties. He believed that the difficulty in the land question was the over-preservation of game; in many instances men had no heart to farm well, when so much of their produce was eaten by game. He thought that they should point out to the landowners that over-preservation was not protective of the tenant's or anyone else's prosperity, and the result would be much better if they would give the tenant a proper guarantee, so that he might cultivate the land as it ought to be. A lease was considered the most satisfactory tenure of land, and at the end of it there ought to be some kind of compensation, mutually arranged between landlord and tenant, and without Parliamentary interference. One of the results of the Irish Land Act had been to drive some of the best landlords out of that country, although the tenants petitioned that they had nothing to complain of. He would like to see the Club form its opinions on the subject, and lay them before the landlords of the country, which could be done in a proper way.

The CHAIRMAN said that Mr. Marshall very properly asked,

"What is improvement?" and if that was answered it would clear the question for discussion. This was perhaps a more difficult question than it appeared at first sight; a man might suppose that he improved the land very much because he ploughed it. They ought to remember that land produced its crop each year at the expense of itself, and every crop taken off took out of the soil so much of that which positively constituted it, and which constituted the elements on which its value depended. According to Liebig, if they took a square yard of land—a foot deep, for that was something like the depth land was supposed to go as far as its important constituents were concerned, and they had in that square yard of land a certain quantity of elements positively necessary for every crop grown—the first year's crop would go with so much, the second year's with so much more, and so on, till, if they waited long enough, nothing would be left; and the farmer who merely ploughed the land and did not put anything back necessarily impoverished it instead of improving it. They should first settle the question "What was positively an improvement?" Mr. Bell's paper was on the relative interests of landlord, tenant, and people in the soil, and as he looked at it the interests had to be considered correlatively, and it was not to be made a question between landlord and tenant. The people had a right to expect the proper cultivation of the soil, but the agriculturist had also a right to expect something from the people. At the present moment all consideration was given to the sanitary arrangements of towns; there was no consideration for the waste of the material on which the land was entirely dependent for its good condition and improvement. The only thought of the people was how to get cheaply fed and comfortably placed without any reference to the condition of the land hereafter.

Mr. BELL, in replying to the discussion upon his paper, said he was very much obliged to them for the kind and temperate way in which they had discussed the paper, especially as it was full of subjects on which men held the most widely different opinions, yet there had been a disposition shown to discuss them fairly, and to find out, if possible, where the truth lay. He asked them to extend to him that indulgence and forbearance they had shown to him at their past meetings, as he felt much in need of it in having to reply to what had gone before. In the first day's discussion no serious objection was raised to the principle of the paper. Mr. Joseph Lee professed to differ with his views on the tenant's interest, but he thought that what he said went materially to confirm his argument that some mutual security was requisite for both landlord and tenant for the interest they had individually held in the soil. Mr. Christopher Gray went off on another tack; it might perhaps soothe that gentleman's disappointment in regard to his paper by his stating that he thought the relations of the labourer to the tenant scarcely came within the scope of his paper, and should be treated as a separate subject. Mr. John Hope's remarks came from the people's point of view, dealing with the subject in its broadest bearing, and he thought, as such, deserved consideration. In dealing with the president's remarks, he must confess to some difficulty, as it seemed to him that several of them were made under some misapprehension of what he (Mr. Bell) had stated. Mr. Grey, in commencing his speech, made him to say that the country which imported its food must necessarily be impoverished, but the most important part of the sentence was omitted, namely, if able to produce it. No one could deny that our country could materially increase its productions, and when they recollected and sufficiently realised the fact that an increase of only one-tenth would add twenty millions to their annual income as a country, he thought that the agricultural interest would not be so coolly ignored by the country. He would almost have preferred not to have had to make an allusion to the game question. However, he must confess he had not seen that it had been shown that it was not a people's question. Granting—according to the President's views—that game ought to be made property, who was to make it so? Landlords and tenants could not make it so, if they were ever so wishful, for it was only the people through Parliament who could make it property. Then, if it was made property, there would be a difficulty in the fencing of such a large stock and in the liability of tenants and landlords for the damages caused to their neighbours' produce. The laws of primogeniture and entail might have their advantages, but it seemed to him that there was a difference in the way of treating land from other sorts of property, in continuing this system of

tying up land, which, as a result, prevented the land from being available in assets to creditors. It also perpetuated a system of life interest which effectually prevented any improvements being effected in the land at the expense of such landowners. That part of the paper which referred to the tenant's interests seemed to have called forth the greatest differences of opinion. Before entering upon the subject they would perhaps allow him to disclaim the most remote connection of anything which savoured of division of property, or, in short, any breaches of the tenth commandment. He should feel very sorry indeed if anything that he had said should cast the faintest breath of aspersion on their landlords; he considered them, as a class, a body of men of whose honour, ability, and generosity they might justly feel proud. Farmers were generally looked upon as grumblers; that was part of their vested rights, that he thought no one was disposed to dispossess them of. They were told to state their grievances plainly and cease grumbling. What they complained of in this respect was that tenants were able and wishful to improve their farms, in many cases double their present produce, which many of them could do very well, but they had no security or guarantee that such improvements should not immediately or six months after pass into the hands of the landlords without any compensation given to tenants for such improvements. The remedy they proposed was this, if farmers did improve their holdings, that they should receive compensation—legal compensation, a legal guarantee should be given to them that they should receive a fair portion of the value of such improvements on quitting their occupancy. He must say that in asking for this he did not see that farmers were asking for anything that belonged to any other person—they were simply asking for what they had created themselves. Let them look after the future of farming. Suppose that in the next twenty-one years the farmers of Great Britain should increase the value of their holdings to the amount of several millions sterling—this they could do, and he believed would do, if such compensation was given to them. But where did this capital exist at the present time that the farmers were going to put into the soil to create this improvement? Clearly not a fraction belonged to the landlord at the present time if the tenants were going to create this proportion themselves. If the tenants shifted their capital out of one place—the place in which it was at present—and put it into the soil to make permanent improvements, all they asked for was simply that it should not be confiscated to the landlord. The great objection to legal security being given to the tenant, so far as he could see, was that landlords and tenants must make their own bargains, and no interference would be allowed. The question arose, “What will they bargain for—what has the landlord to dispose of?” Clearly, the farm in its present condition. They did not want to make the least interference with that, and the landlord had a perfect liberty to farm it, or let it, or to propose such conditions as he chose; but the landlord also claimed the power to confiscate the capital that the tenant might have put in the soil during his occupancy. The Government at present gave them that power; Government did not acknowledge that the tenantry of Great Britain had more, or could have more, than six months' interest in the soil. If they expected more, they must give security of tenure, but if they declined to give such security he would be glad to hear on what mercantile principles they expected the tenantry to increase their interest in the soil so as to materially increase the products of the land for the nation. The president said the tolls and many other things were farmed out on the same principle of a simple bargain, but “toll farmers” were not expected to improve old roads or to make new ones; they invested no capital, and, therefore, there was no parallel. The question in the paper which their President noticed, was “If a man got back his farm better than before whose was the increase?” Mr. Grey answered by asking another, “If a landlord lets a farm at £300 a-year and gets it back worth only £250 a-year whose is the loss?” He did not think that was a fair answer to the question. If one class of tenants wronged their landlords by wasting their farms he did not think that in the least justified the landlord in spoiling another class of tenants who had improved their farms, but the owners, in his opinion, had a sufficient guarantee against any serious deterioration in value in having the power of eviction at six months' notice. This brought him to the difficulty of combining a Tenant-Right with a lease, which he thought would

be unfair to the landlord; because if a landlord agreed to compensate a tenant for his improvement it was not fair to grant a lease, unless the tenant agreed to guarantee him against any deterioration. He considered that a landlord, holding the power of eviction at six months' notice, had a sufficient guarantee that his estate would not be very seriously interfered with; it gave him perfect liberty and choice of tenants, and freedom to do with his estate entirely as he chose. The only thing necessary to be done was to have mutual payment of compensation of all kinds between them, and when that was done they would be put upon an equal footing. He would not wish to interfere in the least with landlords granting leases to persons in whom they had every confidence, but he did not consider that strangers had any ground for asking for a lease under the circumstances. The creation of middlemen, which Mr. Grey spoke of, was not a necessary adjunct to Tenant-Right. He did not think the out-going tenant should have to recognize his successor in any way for Tenant-Right; the whole business lay between the owner and the tenant, and, therefore, middlemen were out of the question. They had heard a good deal about farmers deteriorating their farms, but during the past few years had not the agricultural produce of Great Britain been very largely increased? He was not able to show how much of this increase was due to the landlords and how much was due to the tenantry, but he spoke confidently when he asserted that a good deal of the capital that had effected this improvement had passed out of the hands of the tenantry. The interest on such capital might have ranged from positive loss to the tenantry to over 100 per cent. gain, but that did not affect the argument as to the capital passing out of the tenants' hands. He would appeal to them as to what was the general experience or general practice in regard to letting farms under a lease. The farms at the end of a lease were generally re-valued, and if the farm would bear a rise the tenant had to take it at such valuation, very little account being taken generally of who caused that increased value. There might be exceptions to this, but he believed such was the general practice. He remembered feeling very keenly on this subject himself when in treaty for a farm. An agent offered to a farmer a year-to-year tenancy, the tenant asked for a lease, when the agent told him he would just be as well off with a tenancy from year to year as with a short lease, for the chances were when the lease was out the farm would have to be re-valued and the tenant would have to pay a higher rent. This agent was holding a high position, and he believed he simply stated the truth, to which many experienced farmers would bear feeling testimony. He knew well that there would be difficulties in the way of carrying out the principle he proposed, but once grant the truth of the principle, and he was perfectly sure there would be some way of carrying it out—the difficulties were not insurmountable. Whatever mode of compensation was proposed they would require some local court of arbitration to settle differences of valuation. It appeared to him to be much more pleasant to pay for tangible results than for a primary cause which might have doubtful results and might have sprung from doubtful causes. What he was most anxious for was to have the principle of compensation acknowledged, and not to go into details. The value of the improvements might be allotted at the rate of one-third to the tenant and two-thirds to the landlord, or *vice versa*, or in whatever ratio in which it was thought justice was done to both parties. No local court of arbitration could go further wrong than the present state of affairs which allowed one party to sweep the table of everything. Something was said about the enclosure of commons, and that the surrounding owners were only owners of such commons. It always appeared to him that the rights of the public and the rights of the owners were in an extremely undefined state as to the division of commons. Wysesley Common, situate in the neighbourhood of London, comprising about 365 acres, in 1869 was proposed to be divided, and the Enclosure Commissioners went to Parliament with a bill to divide this common amongst the surrounding owners, and this was looked upon as the legal way of going to work. The bill was framed on this principle; went through the House of Commons into the Committee-room, and witnesses came before the committee stating that they thought the public should be considered in the matter, and instead of confirming the claims of the owners and Enclosure Commissioners, ten acres out of the 365 were set apart to the public. It appeared to him that

the owners claims and the claims of the public had never been clearly defined. Coming to that day's discussion, Mr. Marshall acknowledged the correctness of the principle, yet he seemed to say that there were practical difficulties in the way of carrying it out which prevented it being adopted. He had never heard yet of anything being thoroughly right in principle, but that there was some way of putting it in practice. If the principle was right there must be some way of carrying it into effect, or else the principle was wrong. Mr. Wilkinson talked of taking the property out of the hands of the landlords altogether. He showed as clearly as he could that it was no intention of his to interfere with property as it at present existed, and they could not say that what he proposed would in the least interfere with vested rights. As to the security of tenure in Ireland, it had come out in a marked way lately. It was said when the Irish Land Bill was passing through the House of Commons that property would depreciate in value. In the sale of the Waterford estate lately, instead of property going from 18 to 20 years' purchase as formerly, it had gone from 30 to 50 years' purchase, showing that the security of tenure did not affect the interest of the tenant alone, but also materially affected the interests of landlord and people.

Mr. DRYDEN proposed the following resolution: "That the Club, recognising the right of the people to good cultivation, is of opinion that if security was given to the capital of tenants it would promote the interests of landowners, tenants, and consumers, and that nothing would tend more to the advancement of agriculture than some legislative enactments, giving compensation for unexhausted improvements, and facilities to landlords for obtaining damages for depreciation of property."

Mr. LEE seconded the resolution.

Mr. T. P. DODS said that, not having been present at the previous meetings at which this question had been discussed, and having only come in to hear Mr. Bell's reply, he did not intend to take any part in the discussion, but, as a member of the Club, he rose to express his dissent from the resolution proposed by Mr. Dryden. He held that the public, if they had an interest, it was so remote that it was not an interest in the cultivation of the soil that they could recognise in the terms of the resolution. If they were living under protection, he could see some sense in it, but not as they were. He dissented from the resolution. He was not in favour of having legislative enactments passed, giving compensation to tenants for improvement in the land, because they had already

an Act of Parliament by which whatever buildings were erected by the tenant, with the consent of the landlord, he could either remove or claim payment for at the end of his holding. He could not see that any tenant should be compensated for making improvements at his own discretion on the farm, and without the leave of his landlord. He might go and build a village on his landlord's property, and claim payment for it.

Mr. BELL: That would not come under an agricultural improvement.

Mr. DODS said he did not rise to enter into any discussion, but simply to express his dissent from the resolution.

Mr. BELL remarked that there seemed to be some difficulty in arriving at the knowledge of what was permanent improvement, or what could be called permanent improvement. As he had already stated, Mr. Gladstone, in the House of Commons, when the Irish Land Bill was under discussion, gave one of the best definitions of it when he said it was "whatever increased the lettable value of the holdings." Mr. Dods made an observation about a village being built upon a farm, but that would not increase its lettable value. The tenant, however, was justified in getting the increase if it really did benefit the holding.

The CHAIRMAN remarked that there was such a thing as tenant, who wanted a residence, building a larger house than the place was worth. Again, a man with no capital might build a large place.

Mr. BELL: There is a remedy in leaving the matter to a court of arbitration—if there was any disagreement as to the value of the improvements, if left to the local court of arbitration—to define really the improved value of the holding created by the tenant. If the landlord could show that there was any other thing that had created part of the increased value, that must be deducted from such increased value, but if the tenant showed that he had increased the value, and the landlord was unable to disprove it, then it would remain that the improvement had been created by the tenant. If the valuation was raised, notwithstanding that ploughing and those things were only a means to an end, and the land did take in a certain proportion of ingredients from year to year above that which was taken away, and if there remained when he left as much as when he entered upon the tenancy, and so much more, so as to increase the value of it materially, then it was this increase alone which they were asking for.

Mr. DODS: It would be a fine lot of work for the lawyers.

The resolution was then put to the meeting and carried.

THE FRAMLINGHAM FARMERS' CLUB.

THE DOUBLE-FURROW PLOUGH.

At the first meeting, Mr. Corrance, M.P., in the chair, Mr. J. E. RANSOME introduced the subject of double-furrow ploughing in the following paper:—

I propose this evening chiefly to confine my attention to the consideration of the questions: First, What are the advantages of double-furrow ploughs? Second, Can they be profitably employed on the majority of our farms? For there is no doubt that these are the points which directly interest the farmers of this country. In the first place, however, I think it will be interesting to inquire briefly into the history of double ploughs, to see how long ago they were invented, and how far they have been used prior to their revival in this country a few years ago. The first account of a double plough that I can find is in an old agricultural work (kindly lent me by Mr. Harland, Brompton, near Scarborough), entitled "England's Improvement," by Captain Walter Blith, who wrote in the time of Cromwell. A drawing of this plough is given, and also directions for its construction. In form it is like two ordinary ploughs, with the beams strongly secured together, the handles of the front plough being cut off as well as the fore part of the beam of the hind plough. In his description he says the plough may be set to a working gauge, by means of a foot or wheel placed in the foremost beam, and that upon ordinary arable land, and also upon fair clean lay turf, a double proportion may be ploughed with it, and con-

cludes by adding, "I for the present see not, but it may be of excellent use and expedition upon many lands in England." This plough must have been made more than 200 years ago. In another work, "Arthur Young's Tour to the North," published 1771, a drawing is given of a double plough fitted with two wheels, then in use in the county of Worcestershire. The following is his account of it: "But a new invention is coming in very fast, which is the use of double ploughs, which, with only the addition of the horse, do double the work by turning two furrows at once. It is no gimcrackery business, but so solid and strong a machine that the common farmers approve it, and accordingly some hundreds of them are made." The plough was afterwards improved by Mr. Berney, of Bracon Ash, Norfolk, who attached to it the Norfolk wheel gallops, and, when worked against the Norfolk wheeled ploughs, it did with two horses three acres in the time they did two. See "Farmer's Tour through the East of England, vol. ii. p. 121." Towards the close of the last century, and beginning of this, improvements were made in the double ploughs. Lord Somerville appears to have devoted great attention and energy to this subject, so much so, that by many he has been considered the original inventor; but, although this is not the case, he, undoubtedly, greatly improved the plough, and did much towards its introduction. His plough, patented in 1802, had but one beam curved in the middle to adapt it to take

the two ploughs. The mouldboards were made in two parts, and the tail end could be set out more or less to suit different sorts of work. A Leicestershire plough-wright, Mr. Mandford, of Iltham, made the first adjustable double-plough about the same period. The beams in this could be set wider or narrower, by means of screw stays, to plough different widths. Mr. Billingsley, of Slephton Mallet, used one of these Leicester ploughs worked by oxen, and it is recorded that six oxen ploughed 355 acres with it, in addition to other work, within eleven months, and that they generally turned two-and-a-half acres in eight hours. He says: "Some may doubt the possibility of making the double-plough so generally useful, but I can truly say I never yet found an instance where it could not be worked to advantage." To show what was actually accomplished at that early date with double-ploughs, I have extracted the following from an article on double-ploughs given in Rees's Encyclopædia. It is there stated that at a trial which took place on the Royal Farm at Windsor, 17½ acres of unstirred land were ploughed with four Devon oxen, one man and a boy in six days and a few hours, and that the oxen were in better condition after the trial than at the beginning. This is close upon three acres a-day, which you will allow was not bad work. In the same article mention is also made of a Mr. Tweed, of Sandon, Essex, who used the Someville double plough, and who gives the following account of the work in a letter to his lordship, dated Sandon, 1802: "I take the liberty of stating the experiments I have made with your two-furrow plough on strong land. I put my first plough to work with three horses and one man, against two of my own and four horses, held by two remarkably good ploughmen, who are very much averse to any new implements. After exerting themselves to the utmost every day for a month upon clover lays, bean and peaches, for wheat, they allowed, very much against their inclinations, that it performed the work best, which is entirely owing to the superior form of the breast, and the great advantage derived from the moveable plates. This trial having perfectly convinced me that there is an absolute saving of five shillings a-day every day they are used, I ordered a second, and soon after a third, and have ever since had all my work done with them, which before employed six ploughs, twelve horses, and six men, causing a reduction of one-fourth the horses and one-third of the men, and it is in my opinion one of the greatest improvements that ever was made in agriculture, for which I conceive the public and myself highly indebted to your lordship." It will thus be seen that double ploughs, even at a very early date, were found to be thoroughly serviceable and economical implements. Various trials of double ploughs were conducted by the Bath and West of England Agricultural Society at the beginning of this century, and so thoroughly did they then consider it a standard implement, that it was engraved at the head of their printed forms, used when giving diplomas in connection with the Society. We have in our possession one of these diplomas, given to Mr. Robert Ransome, my grandfather, in the year 1807, as an acknowledgment of the superior excellence of his new patent chilled cast-iron plough-shares. Since that time various improvements in the different parts of the plough have been introduced. Our own firm, upwards of 60 years ago, brought out a double plough, with wood beams, some of which have been in use to the present day. We have an entry in one of our old day-books of one supplied to the late Sir Wm. Middleton, of Shrlnobland Hall, dated February 12, 1818, "One new double plough. Repairing one old do." And they were worked on this estate for 40 years by two oxen to each plough, and doing their 1½ acres a-day. Subsequently this same plough was made entirely of iron. Later forms of double ploughs, in both iron and wood, have been made by ourselves and other manufacturers, and many thousands have been sold for use in this country and other parts of the world, though probably the greater number have been sent abroad. Now is it then, as it is clearly seen from the foregoing remarks that double ploughs have been made in considerable numbers, and have done their work satisfactorily and well, that they have not come into much more general use in this country? The reasons are several: 1st. Because there was not the same urgent necessity for their use that there is now, and it was not sufficient to overcome the prejudice in favour of the established usage. As an example of this we may take the now almost universal "wheel" plough, which had a hard

fight and a long one before it established its superiority over the old swing plough; and again, thrashing and reaping machines were some time in replacing the flail and the sickle. There is no doubt that the difficulty of obtaining skilled labour had a great influence in bringing about all these changes, and the daily increasing scarcity of labour has been a most powerful stimulus during the past few years to the introduction of the double plough. 2nd. Increased competition between this country and others in the produce of the soil makes it as necessary for the farmer as for the manufacturer to avail himself of any machine or implement which will lessen the cost of production. 3rd. The old form of double ploughs was not so convenient and easy for the ploughman to manage as those lately introduced. 4th. The old double ploughs did not draw so light as the new ones, especially on mixed and heavy soils, so that they were often too much work for three horses; consequently their use was confined almost entirely to light soils. When, however, the "Pirie" plough made its appearance in 1868, the time had come when farmers were well prepared to adopt any new implement that would help them in their labour department; and this, together with the fact that a considerable saving in draught was effected on many soils by the new implement, by the application of the friction wheel and also the greater ease with which the plough could be turned at the headland, are the principal reasons, in my opinion, why the double plough has revived at the present time and acquired such a deserved and well-merited popularity. To come now to the double-furrow plough of the present day, with all the improvements that have lately been made in it. To Mr. Thomas Pirie, Kinnundy, N.B., belongs the credit of bringing out the double plough in an entirely new form, and especially of fitting to it a friction wheel to run behind the plough in the angle of the furrow in place of the slide, in order to reduce the draught. For his invention he obtained a patent in July, 1867, but the plough was first brought to notice in this country at the Leicester meeting of the Royal Agricultural Society of England, 1868. From one cause or the other it did not figure very well at that meeting. It was not tried on the dynamometer, but one of his single ploughs, constructed on the same principle, was tried against the general purpose ploughs, and came out very heavy in draught. It had, however, been doing very well in Scotland, and Messrs. Fowler, of Leeds, took up its manufacture, and soon introduced a considerable number, having made several improvements in it, principally in the detail of its construction. The general form of the Pirie plough is so well known that I need not give you a detailed description; suffice it to say that it consists of two plough bodies carried on a wrought-iron frame work: this frame work is entirely supported on wheels, two of which run at an acute angle in the furrows, one in front, the other behind, and a third wheel runs a good distance on to the land, about midway between the other two, so that the plough is supported on three points at the corners of a triangle. The leading furrow wheel is steered by a handle leading to the back part of the plough, and handles are entirely dispensed with, but it is turned round at the headlands by depressing the land wheel and steering the leading furrow wheel. I shall not attempt to describe the various patterns of double-furrow ploughs made by the English and Scotch makers—our own firm, Howard, Horsby, Ball, Perkins, Pirie, Gray, Murray, Jack, Mitchell, and others, who have all been paying the greatest attention to the production of the best form of double ploughs. Some—and especially the Scotch makers—have more closely followed the general outlines of the Pirie plough; whilst most of the English makers—Messrs. Fowler excepted—have retained the handles and general form of the English double plough; but one and all have adopted the friction wheel for lightening the draught. The following are some of the chief points which should characterise a good double plough: 1st. It should not be heavier than is necessary for the land it is intended to work upon. 2nd. It should be strong and simple in construction. 3rd. It should have good clearance between the two plough bodies, to allow the second furrow to pass freely. 4th. It should have sufficient height under the beams to prevent any accumulation of rubbish. 5th. It should be so arranged that the width of the furrows can be easily altered. 6th. It should have a friction wheel to run at an angle in the furrow, to take the weight of the hind part of the plough, and the friction against the land side and sole caused by turning the furrow slice. This friction wheel should

be adjustable in depth and width to adapt the plough to a hard or soft bottom, and a slide should be interchangeable with it for special places—such as stony ground. 7th. It should be arranged to lift out of work, and turn easily at the headland without cutting up the ground. 8th. It should have a pair of handles of sufficient length for the ploughman to guide it, and assist it round at the headland. 9th. It may be furnished with a steering lever if desired, but when the plough is furnished with sufficiently long handles I do not consider it necessary, and it adds to the weight and complication. 10th. It should be fitted with the best breasts, shares, coulters, and skin coulters, to enable it to do its work efficiently and without waste of power. These points we have endeavoured to carry out in our double plough, but I especially wish to draw your attention to the principle, invented by my partner Mr. Jefferies, which we have adopted for lifting and turning them at the headland. Instead of depressing and locking the leading wheels, we lift the plough bodily off the ground in the centre of its length. This principle is carried out by us by adding an extra wheel on the off-side of the plough, and this wheel (which is simply carried idle when the plough is in work) is, together with the land wheel, brought down to the ground on reaching the headland. The ploughman pulls a lever connected with these two wheels, which, with the onward motion of the horses, lifts the plough bodily on to these two wheels three inches above the ground. On these two wheels it rides round as easily as on a cart, and, being made wide apart, the plough cannot be upset. We now come to the question of draught. Is a double-furrow plough lighter in draught, in proportion to the work it has to do, than a single plough? Or, in other words, can the same work be done with less power? This is, after all, the great point in connection with this subject; and without troubling you with all the figures and experiments which have led to my conclusions, I will endeavour to make clear to you the results at which, in my own mind, I have arrived. From the various dynamometrical experiments which I have made at various times on very different soils, and in various conditions as to moisture and draught, together with the reports of other draught trials, both public and private, I have come to the following conclusions: The comparisons are between ploughs exactly alike so far as their breasts, shares, and coulters are concerned, and taken at the same depth and width of furrow in each case. 1st. The old form of double-furrow ploughs, which had two slides, one on each plough body, took twice the power of a single plough fitted with slide. 2nd. A double plough of which the back part of the front body is cut away, and which has only one slide on the hind plough, does not take more than $1\frac{1}{2}$ times the draught of a single plough fitted with a slide. 3rd. A double plough of the new sort, with a friction wheel behind instead of a slide, does not take more than $1\frac{1}{2}$ times the power of a single plough with slide. 4th. A single plough with a friction wheel takes about three-quarters of the power of a single plough with slide. 5th. A double plough, with a friction wheel, takes just double the power of a single plough with a friction wheel. On dry, hard land the above proportions do not hold good, and it is very doubtful if any advantage is gained on land in this condition by the use of the friction wheel. A slide then goes almost equally light, but when the land is wet there is considerable suction between the slide and the furrow bottom and land side, especially when the soil at all inclines to a heavy or sticky nature, whereas the friction wheel runs almost equally lightly on such land, the friction in this case coming on to the axle and nave of the wheel. It is important that the axle should be true and smooth and fit the nave well, and that all dirt should be excluded, in order to reduce the friction to a minimum, and for this reason we bore out the naves of our plough wheels and turn the axles, providing them also with an oil-hole, and exclude the dirt by a leather collar and steel plate at the back of the axle. On land with a rough stony bottom I have understood that the wheel is not so good as the slide, as it rises and falls over all the stones and inequalities, but I have not tried any experiment on such land. Taking the above figures to be correct, and the average draught, on a mixed soil, of a good single plough with slide when ploughing six or seven inches deep, being taken at 24 stone, we should have the draught of a single plough with friction wheel, 18 stone; double plough with friction wheel, 36 stone; double plough with one slide, 42 stone; double plough with two slides, 48 stone. Of course, these draughts will vary on

different soils; and the advantage of the new double plough will be still greater when compared with many of the older patterns of single ploughs still in use, but it may safely be taken for granted that in almost all cases the double ploughs do not draw more than half as heavy again as the single ploughs, and the heavier and more sticky the soil the greater is the gain. The above statement is confirmed by the great trial of double ploughs held at Peterborough, October 4th and 5th, 1870, when the draught experiments were conducted by Mr. Amos, C.E., late consulting engineer to the Royal Agricultural Society of England. The proportion between the average draught of five double ploughs and the single plough of best construction was as 702 to 470, or half as heavy again. On the 15th November of last year another very careful experiment was carried out by the engineers to the Royal Agricultural Society of England, Messrs. Easton and Anderson, through one of their staff, Mr. Kiehe, at Caistor, the proportionate power to move 1lb of earth with a single plough was 14.9, against 10.6 with the double, showing a saving in draught in favour of the latter of 29 per cent. I could easily multiply proofs that there is a great saving in draught, but I think I have said enough. Let us now look at the advantages to be gained by the use of double ploughs. 1st. Double Work: They will do twice as much work as a single plough in almost all cases. Sometimes, when the horses are not fully up to the mark, it may better do rather less than this, but even then a very largely increased amount is accomplished. 2nd. Saving in horse power: As we have seen, the draught is only half as much again; therefore, three horses harnessed abreast will do double the work of two on a single, and not be any harder worked. When three horses are used on a single plough on very heavy land a four-horse team is sufficient for the double, but on very heavy work I should rather recommend two single friction wheel ploughs, worked by two horses each. On many light soils two horses are often employed on single ploughs, because one would hardly be sufficient, and in such cases the same two horses can readily manage the double plough, and not be distressed with the work. Many double ploughs are now being worked with two horses only on light lands. 3rd. Saving of labour: One man with a double can do the work of two men with single ploughs, as when three horses are required they are driven abreast and guided by reins. Working three horses abreast: In using three horses on a double plough, the most effective way is to yoke them abreast, two on the land and one in the furrow, as their power is not only more economically employed, but one man is sufficient with the plough. In this case they should have compensating three-horse whippetrees, so that each horse may have its fair share of work. When preferred, two horses may be driven at length in the furrow and one on the land; but it is very objectionable to work three horses at length, as too much strain is thrown on the last horse on coming out at the headland. 4th. Work done better: The work can at all times be done equally as well as with a single plough, and it entirely prevents a man carrying a plough on its back, and so cutting an uneven bottom, which can be done with a single plough even when fitted with flat cutting shares. As a rule, too, the furrows are more firmly closed and packed together, whilst the additional weight, and the very fact of having two plough bodies working together in the ground at one time, make the plough steadier and less liable to be thrown out of the ground by one of the bodies coming against a stone or other obstacle. 5th. Pan of furrow not so much trodden: As only one horse walks in the furrow, and two furrows are ploughed at one time, the horse walks in each alternate furrow, instead of every one, and the pan is consequently less trodden down. 6th. Furrow bottom not glazed: By the use of the friction wheel, instead of the slide, all glazing, both of the bottom of the furrow and of the land side, is avoided, but they are left just as the share and coulters leave them, so that both air and water can get more freely into the soil, and a better bottom is left for the roots of the plants. 7th. Ploughing hill sides: In hill-side ploughing they are very serviceable, as, by ploughing up and down the hill, two horses can carry two furrows down hill, and by slipping one furrow up hill, the two horses can take one furrow up hill; thus in each round ploughing three furrows against two furrows with the same team on a single plough. 8th. Subsoiling: They form one of the best implements for any ordinary subsoiling. By removing the front plough, and adding

a subsoil tine to follow the furrow horse and subsoil the previous furrow, the hind plough turns a furrow over the loosened earth. In this way all treading of the horses on the subsoiled work is prevented, and generally three horses can plough and subsoil effectively to the depth of ten or twelve inches. 9th. Potato planting: They are very useful for potato planting. By setting the ploughs to the widest width, say twelve inches each furrow, or more if desired, the two carry 2½ inches, and the potatoes are set in the furrow and covered the next round. This ensures the widths of the rows being exactly alike, and facilitates after operations. The boys who plant the sets have not to wait a round, as they would have to do with a single plough. 10th. Paring stubbles: They are very useful for paring stubbles. The ploughs being set to their greatest width, and furnished with broad shares, 12 inches wide, the surface, to a breadth of 24 inches, may be pared at one time with a pair of horses. The greater weight of a double plough keeps it more steadily at the shallow depth of say two inches than is possible with a single plough. 11th. Beginning and Finishing. The ridges, tops, or beginnings can be easily set with a double plough. By taking a small furrow with the front plough on the first half-bout and a full furrow with the hind plough which lies on the first furrow, then returning with two whole furrows to back up the top, three furrows are shown the first round against one with the single. The finishes can also be made, the only care necessary is to keep the ridges an equal width and the furrows parallel, so as to leave an even furrow at last. The best way to finish is to take the last or bank furrow and the mould or brow up at the same time. If two solid furrows should be left at the finish it is as well to plough one off first, letting the front plough slip empty up the open furrow. In beginning and finishing with the double plough, it is a very great advantage to be able to set the hind plough lower than the front one, and in our ploughs we make the front plough body moveable up and down, so that their relative positions may be altered. Although, as I have said, the ridges and finishes can be easily and well done with a double plough, many prefer to keep one single plough going with two or three doubles, in order to set the ridges and make the finishes, and I think at first, at any rate, it is a very good plan, and I am not sure it is not always the best when several doubles are at work together. In order to make the most of the advantages to be gained by the use of double ploughs, it is very desirable to have the lands or stetches as wide as possible, for although these ploughs may be worked, and are a great assistance, even where the lands are narrow, they are much more so when the distance between the ridges is sufficient to enable them to go a considerable number of rounds on each ridge. I have no doubt the adoption of these implements will tend to the practice of setting out a greater bulk of land in wider stetches than hitherto, and also to keeping them as level as possible, which is very desirable for the after operations of both reaping and mowing machines. 12th. All kinds of work: All kinds of work can be done with the double plough, with the exception, perhaps, of ridging or banking up land for the winter. They will do ley ploughing for wheat, stubble, or autumn work, and cross ploughing, and may be worked at any reasonable depth. They can be fitted with all sorts and widths of shares, and with different forms of breasts or mould-boards, to suit different practices and requirements. 13th. Work done at proper time: One of the greatest advantages of double ploughs, besides the saving of labour and horse power, about which I propose to make some further remarks, is undoubtedly the great facility they give for getting the work done at the proper time. That a farmer should be able to get his stubbles broken up quickly in autumn, and his land prepared for sowing when the weather is favourable, is too well appreciated to need any remarks from me. As the double plough gets over a double quantity of work with an increase of only fifty per cent. of horse power as compared with a single plough, the work with the same lot of horses is done much more speedily. Take the case of a farm where twelve horses go to plough with six men and six single ploughs, doing six acres a-day. The same horses, worked three abreast on four double ploughs would do eight acres a-day; consequently, in a week, they would do forty-eight acres, whereas the single ploughs would take eight days to do forty-eight acres. The doubles, therefore, do any given amount of work with the same horses in three-fourths of the time, and, in the above instance, two men would be spared for other work, and the

ploughing being finished sooner, the men and horses would be sooner ready to undertake any other work that might be required on the farm. 14th. Extra time and facility for other operations: As the double plough enables a farmer to get his ploughing done quicker, it greatly helps him in getting on with other work on the farm which would otherwise have to be delayed. This is one of the greatest advantages gained by the introduction of these implements, and one which every farmer will appreciate. 15th. Money saving: On the other hand, and especially on those farms where the staff of men and horses kept has been sufficient to do all the work at the right time, and in a proper manner, a considerable saving in expenditure can be effected by the use of double ploughs. To show this more clearly, I will first take the case of a farm having three hundred acres of arable land, and on which, as a fair average, twelve horses are kept. Assuming—and in some cases I believe the assumption is correct—that no larger number of horses need be kept than a sufficient to do the ploughing, the following calculation would hold good: Six men and twelve horses would be required on such a farm to work six single ploughs, whereas three men and nine horses would work three double ploughs, thus saving three men and three horses. The horses might be entirely dispensed with by careful management, and the men during the time they would have been engaged in using the single ploughs. These three hundred acres of wheat, clover, peas, beans, barley, oats, summerland, or root crops, would take at least two ploughings each per acre on an average, or say six hundred acres of ploughing. Taking one acre per day as the work of each single plough, or two acres per day as that of each double plough, the ploughing would occupy seventeen weeks. The following calculation will show the saving effected: Interest on the value of three horses at £30—£90 at 5 per cent., £4 10s.; annual decrease in value, at £2 each, £6; hazard of loss at £5 per cent., £4 10s.; annual value of food, three horses at 12s. a-week, £93 12s.; shoeing and farriery at £1 each, £3; wages of three men for seventeen weeks at 10s., £35 10s.; total, £137 2s.; deduct interest on value of three double ploughs at £10, at 5 per cent., £1 10s.; total, £135 12s. Say a net annual saving of £135, which is equal to 9s. per acre on the whole farm. This may perhaps be an extreme case, or at any rate not the most usual way in which the saving effected by double ploughs would be taken, though I shall give you presently one or two statements from practical men corroborative of the above calculation. If two horses out of the twelve could be dispensed with, it would save £100 a year, or 6s. 8d. per acre. If only one horse out of twelve could be sold, the saving would be £60 a year, or 4s. an acre. And if no horses are sold, we still have the item of wages £25 10s., which is saved, or equal to 1s. 8d. an acre. On some light land farms where a great deal of the work will be done with two horses on a double plough, I believe quite the above saving may be effected. Three-furrow ploughs: Indeed, on such farms there is no reason why three-furrow ploughs should not be used, drawn by three horses, or even four-furrow ploughs, but one objection to these is the wide headlands they make from one plough having to be fixed behind the other. Three-furrow ploughs have been made many years ago. I found a most interesting account and drawing of a three-furrow plough invented by the Rev. Edmund Cartwright, of Woburn, Bedfordshire, in the year 1804, which was regularly worked on light land with two horses and one man. If this could be accomplished then, why not in the present day with all our modern improvements, and means for lightening draught? In support of my statement that a considerable number of horses could often be dispensed with, I will give you an extract from some remarks made by Mr. Stein at a late meeting of the East Lothian Society. Referring to the saving from the use of double ploughs, Mr. Stein said: "He had reduced his stock from 4½ to 3½ pairs of horses (9 to 7), and he could quite as easily accomplish his work. He worked the plough with two horses in seed furrow, and three horses in stubble. He could work also on stubble with two horses, but he did not think it was economical to do so. With two horses he could turn over two English acres of seed land per day. On stubble land the horses did not go so fast." At a meeting of the Haddington Farmers' Club reported in the *Farmer* of December 25, 1871, Mr. James Wyllie read a most able paper on the double plough, and said: "On an ordinary sized farm the saving effected by them must be very

considerable, and I have no doubt that in some cases from their use a pair of horses might be altogether dispensed with, in which case a direct saving of about £100 a year would be at once effected." At the discussion which followed, Mr. Smith, of Stevenson Main, said since introducing this implement he had reduced the number of his horses and now worked 350 Scotch acres (which are equal to 444 English acres) with four-and-a-half pairs of horses. Another gentleman calculated the saving at 5s. a day for every double plough he used. That I might be able to speak with some degree of certainty of the practical use of double ploughs as they had really been proved in work, I addressed a series of questions to gentlemen in various parts of the country who had bought double-furrow ploughs from us, and I am glad to take this opportunity of thanking those gentlemen publicly for the very kind and courteous manner in which they acceded to my request, and feel that they have helped me in bringing this paper before you to-night, and I think also through the medium of your Club, it will not be without its effect on many who may have hesitated at present to avail themselves of the advantages of double ploughs. I cannot pretend to give you anything like a summary of those reports, which are almost all of the most favourable character, and in the few instances where double ploughs have not proved successful it has either been from a plough being sent which was not suitable to the land, or one of the earliest patterns, which were not so easy to manage as those we have more recently improved. They come from over 100 English farmers residing in 30 different counties, from several in Wales, and a not inconsiderable number (14) from Ireland. However, I will give you a short summary, and will lay the whole of the reports I have received on the table for any gentleman to look over, and also a book containing an analysis of the answers from each one. The reports in answer to the question, "How have you got on with your double plough?" are—"Well." "Very well." "First-rate." "Exceeded my expectations." "Perfectly satisfied." "Could not do without it," and so on. Quantity of work done, "generally double." Number of horses required: In answer to the question, "How many horses do you use on your double, and how many on your single ploughs?" there are 107 replies—

1 uses 2	horses on double to	1	on single.
8 use 2	ditto	2	ditto
77 use 3	ditto	2	ditto
1 uses 3	ditto	3 and 2	ditto
6 use 3 and 2	ditto	2	ditto
2 use 4	ditto	2	ditto
1 uses 4 and 3	ditto	3 and 2	ditto
1 uses 5	ditto	3	ditto
1 uses 5	ditto	4	ditto
1 uses 5 and 4	ditto	3	ditto
1 uses 6 and 5	ditto	4 and 3	ditto

Soil: Out of 111 replies as to nature of soil, 23 are heavy land; 10 are heavy and mixed; 27 are mixed; 11 are mixed and light; 18 are light; four are fen land; one is stony and rocky; and 17 are all kinds of soils. Parting with horses: In answer to the question, "Will the use of double ploughs enable you to part with any horses?" out of 116 reports, 58 say they will be able to part with one or more horses, 24 do not say what proportion; nine can part with one out of four; eight can part with one out of five; six can part with one out of six; one can part with one out of seven; five can part with one out of eight; one can part with one out of ten; one can part with one out of eleven; one can part with two out of four; one can part with two out of six; one can part with two out of nine. Proportion of work done with doubles: In answer to the question, "What proportion of work can you do with the double plough?" the answers vary from "half to three-quarter," "nearly all," and "all." Difficulty or not with doubles: To the question "Have your men found any difficulty with the doubles?" the answers are, "Very little or none." And now to those who may hereafter make trial of double-furrow ploughs, let me say—Don't be disheartened if the work is not so well done at first as you could wish. A little time, thought, and patience will soon enable you to conquer the little difficulties that will at first arise, but which you will find only small difficulties after all. The two furrows must be carefully watched to see that they are equal in breadth and

depth, and this point well attended to will be half the battle in producing good work with any well-made double plough. There is one short extract from the work of Walter Blith, already referred to, which I feel I must give here as too good to be lost, on "The Best Way for the Tryall of a New Plough." "And, secondly, having his plough and all its accoutrements completed, then to the tryall of it, and therein be sure to make the first tryall of your plough upon land, workable and regular lands, not upon lands above measure hard, rooty, rushey, twitehey, or any way infeasible, because upon such lands a true demonstration of the goodness and truth of the plough cannot be discovered, nor any rule can be observed. Because such lands will more easily and suddenly wrench, writh, or put a new plough out of its work before it be wrought into its work; a rough, new plough being somewhat like an unbroken horse, which may easily be spoyled in the hand of a violent madeap rider, but if the horse be kindly used, and taken off his untamedness by degrees, by ease, kindness, and patience, he is made a horse for ever; so after that, in ordinary land, your patient, discreet ploughman have well scoured your plough, brought it to a true furrow both for breadth and depth, and set your irons so it will go itself with the very bearing of the hand to keep it steady, then you may afterward be bold to put it to any service on any lands whatsoever the strength of it will abide, and it may be serviceable for many years." And to the ploughman he says: "I shall dismiss my ploughman with this exhortation—be as willing to learn as thou hast need; and abandon those poor, silly shifts men make to preserve themselves ignorant and unserviceable, as they have been ploughmen all their days, and are not now to learn; and men may as well be too precise, and better ploughs cannot be made than their country affords, and could better have been devised they would long since; with hundreds more so childish as are not worth an answer; but these exceedingly stifle and choak invention." I am afraid I have wearied you with so lengthy a paper; but I must not sit down without thanking you for having invited me to bring this subject before your Club, which I have had great pleasure in doing. Our firm has long been known in the manufacture and improvement of the plough (now nearly ninety years), and I, personally, have had much to do with the working and improvement of the plough for the last ten or twelve years, so that, beyond a matter of business, anything relating to the plough is a matter of interest to me.

Mr. GOODWYN said the difficulty he saw with regard to the introduction of the double-furrow plough was the question whether it could be used on heavy land as it could be on light or mixed soil. There was no doubt it would be a great boon to the light and mixed soil farmers; but he had considerable doubt whether in this heavy-land district they would be able to use it more than at certain seasons of the year. On the average of years he questioned whether in their district two breasts following each other so closely could do the work satisfactorily. If the double plough could be used only for a part of the year, it was questionable whether the saving of horse labour could be effected. The implement would be very valuable after harvest for stubble breaking, and probably it would be available for seed ploughing; but how would it be for ploughing beet land when soaked with water? He should be very glad if it would answer all the year round, and all would be glad to embrace such a system; but there must be great hesitation before they reduced the number of their horses or men, unless they were certain that they could use it all through the year. If he was on a light-land farm he should not hesitate to go in for double ploughs, and discard the single plough; but in this heavy-land district there were times when it was difficult to get the single plough through.

Mr. CHARLES CAPON said there was no difficulty in using the double ploughs from the breasts following too closely, there being plenty of width between them. The friction wheel was a great improvement on the slide, there being nothing for the earth to ball on. He had bought a double plough and had tried it, and did not doubt it was to be made to do all the year round. He confessed that he did not give his fair trial, for he put it on a piece of beet land on a drizzly day, and the beet tops being very bad, they got round the wheels. The plough, however, did its work as well if not better than the single ploughs, and his man liked it.

Mr. GOODWYN said the double plough necessitated wider stretches, and this would require better drainage.

Mr. CAPON said, whether the stetches were wide or narrow, the land wanted to be thoroughly drained.

Mr. GOODWIN said no doubt, but wide stetches required it more than narrow.

Mr. ROBERT GARRARD said he had had a double plough of a Scotch make since Michaelmas, and it had worked uncommonly well. Three horses made two furrows with it more easily than two horses made one furrow.

Mr. CAPON bore testimony to the ease with which Ramsomes' double plough turned. It turned as easily as if in a cart.

Mr. WOLTON said fifteen years ago he saw a double plough very much like the primitive one which Mr. Ransome had shown them in the old book at work at Shotley. It was drawn by two cart-horses and a riding-horse, and was worked successfully for years.

Mr. CAPON, in answer to Mr. Jeaffreson, said he thought he should set up another double-furrow plough.

Mr. RANSOME, in answer to the President, said that cost of ploughing by the double-plough system would be about 6s. 3d. per acre.

Mr. CAPON said the single-plough system cost about 9s. an acre.

Mr. RANSOME said that fellows might be very well ploughed by the double-furrow plough if a deeper breast were used; it would be a good plan to keep breasts on purpose for such work. The breasts would not occupy much time in changing. The double-furrow ploughs could be used on any farm where three, or even where two horses were kept—in fact, where there was a plough used at all.

The PRESIDENT said they would find that Mr. Ransome had given them something that they could sympathize with when he told them that the introduction of machinery rested much on the scarcity of manual labour. Did they not see some signs that they were about to experience a scarcity of labour such as might lead them to try a new invention? He relied more upon the testimony of practical men in the information given to Mr. Ransome than upon the dynamometrical trials, because that information had been gained under different sets of conditions. He quoted Lord Western's saying that he would plough with racehorses if he could, to show that the speed gained by the double system was valuable. He would suggest a modification of the tires of the wheels to prevent clogging in bad weather.

Mr. JEAFFRESON proposed and Mr. GARRARD seconded a vote of thanks to Mr. Ransome.

FREE TRADE IN BEER.

At the meeting of the Norfolk Chamber of Agriculture, the Reverend JOHN GUNN read the following paper, On the Advantages of Free Trade in Beer, subject to Police Regulations and Inspection:

I gladly avail myself of this opportunity to submit to the consideration of the members of the Norfolk Chamber of Agriculture the best practicable means of supplying the labourer with good and cheap beer. You will agree with me that the Malt-tax is a most cruel and disgraceful impost, which deprives the labourer, who toils to raise the barley, of the beer which is requisite to recruit his strength. Hence, with the imposition of the Malt-tax, commenced a system of demoralization by which that which ought to be a portion of the labourer's daily meals is reduced to become an article of occasional merriment, and the abuse of malt liquor was substituted for the use of it. Under parching thirst, moreover, the labourer is tempted to buy beer at a higher price than in justice to his wife and family he can honestly afford to give. This exorbitant price is mainly, but not entirely, caused by the Malt-tax. Hence we see its demoralising tendency, inasmuch as it tempts him to break the first laws and the dearest ties of nature; which is worse than the vice of drunkenness. I do not mention the injury done by the discontinuance of the practice of cottage brewing, great as it undoubtedly was, because it may be questioned whether, if the duty on malt were entirely repealed, the labourer would again return to it. And for this reason—we all remember the slopping there was in making ginger-beer at home, but now that we can buy ginger-beer cheaper and better than our wives can make it, we have given it up. Just so I believe it would be with home brewing. It would be to a great extent superseded by the excellent beer which the public brewer would furnish us with under a system of freetrade and competition. Great as the evils are which are caused by the duty on malt, they are greatly aggravated by restrictions upon the sale of beer, which create a monopoly, and tend to open the door to the sale of an inferior and perhaps an adulterated article. The injurious effects produced by the use of intoxicating drugs are too well known to be described. The beverage—I will not call it beer—is calculated rather to stimulate than allay thirst, and, by inducing the thirsty soul to drink to excess, causes not only violent and immediate outbreaks, but leads to lasting habits of intemperance. I am happy to say that such injurious effects are much less frequent than they used to be since an extension of licences has taken place, notwithstanding that the sale of beer is greatly increased. But still there are some well-meaning but ill-judging persons who are endeavouring to meet the evil by shutting up as many public-houses as possible, and resisting the opening of others. The consequence of this is that the monopoly is increased, the value and rent of the favoured places are

raised, and the publican is tempted to have recourse to unfair practices in order to recoup himself. Such would have been the working and the result of the proposed Government Bill, by which the number of houses for the sale of beer would have been reduced, and some would have been put up to public competition. Large sums would no doubt have been given for them, and the consumers of beer would have been ultimately mulcted for the payment. Probably such an infringement of the laws of Free Trade and interference with the supply and demand are unexampled. The injustice of the restrictive system was brought to my apprehension very vividly some years ago in a case in which I was personally interested. On the retirement of a near relative from the business of a brewer several public-houses were put up to sale, and they fetched from £500 to £1,200 each, while their intrinsic value as dwelling-houses would not have exceeded £100 on an average. Who, let me ask, paid for this excessive price, which was due to monopoly? It was, no doubt, the consumers of beer, and principally labourers. The independent brewer, who relies solely upon the merit of his beer for its sale, would be shut out and injured by such a monopoly. I have often inquired at public-houses where inferior beer is sold whether they are free or tied, and the invariable reply is, "I wish it were free." "Why so?" I asked again; and the rejoinder is, "Why, then I could go for my beer when I liked." I humbly submit that beer ought to be sold as bread or any other commodity, without any impost or restriction, except a nominal payment for a licence for the purpose of giving notice to the police and the excise. Competition would insure a genuine and wholesome beverage; and if the duty on malt were reduced, for instance, one-third, the benefit would reach the consumer, and would not be retained in the pockets of the brewer. A cheap article would then be produced at an easy distance from the labourers' homes, so as not to become flat and stale by its being carried from the distance of the present range of public-houses. It would thus become an item of the daily sustenance of the labourer, and the use would be substituted for the abuse of malt liquor. It may safely be assumed now that not one out of twenty labourers drinks as much beer as he ought to do for his bodily support and refreshment, and therefore there is a wide margin left for the increase of consumption, which would far more than compensate the revenue for the proposed reduction of the present duty on malt. The Chancellor of the Exchequer ought not to grudge the trifling sacrifice of the licence duty, for to insist upon that, as well as the malt-tax, resembles the Irishman's mode of lengthening his blanket by cutting off a piece at one end to add to the other. With respect to the moral effects produced respectively by the free and by the restrictive systems, they appear to

me to be decidedly in favour of the free. In the parish of which I was forty years incumbent, some well-meaning persons succeeded for a time in closing all places for the sale of beer, and I can truly affirm that the measure was morally injurious. Some of the people clubbed together to purchase gin, and met on the Sunday at each other's houses to drink and play cards. Again, when the labourer has to walk about two miles to a public-house, situate in another parish, he does not think it worth while to walk so far for a single pint. He indulges in more, and returns reeling home. He is under less restraint in a more distant place, being less known, and, if young, not unfrequently amuses himself by pulling gates off their hinges, and sundry such freaks, which he would not venture upon if the public-house were nearer his own home. I may safely affirm that there are more confirmed sots generally in places where there are no beer-shops than where there are, owing to the facts that they drink more at a sitting and are less under restraint. Such is the case in country parishes, but how would it be in towns where public-houses are about 100 yards about? Suppose half of them to be closed, and the consumers to have to walk 200 instead of 100 yards. What real difference would it make to them so far as regards the distance? None whatever; but competition would be less, inferior beer would probably be sold, and a larger number of drinkers would be congregated in consequence of the diminution of the number of places of retail. Viewing the subject in every point, it is my conviction that the advantages, both physical and moral, are in favour of an unrestricted trade in beer—*i. e.*, the leaving the number of houses to be regulated by the ordinary relations of supply and demand; provided always that the sale be subjected to the strict surveillance of the police, and to inspection in order to prevent the use of deleterious drugs. I rely, however, upon free competition mainly to insure a good, wholesome, and cheap article, and to increase the consumption to such an extent as to compensate for loss that would otherwise be sustained by the revenue from the reduction of the malt-tax. That such an increase would arise may be assumed from the fact that, under present arrangements not a tenth, I might say twentieth part of beer is consumed in agricultural districts that ought to be at the labourers' daily meals. In consequence of the duty on malt and its high price, the master no longer or very rarely gives home-brewed or any description of beer to his men. The labourer himself cannot afford to buy malt and brew, except at harvest or harvest time, when his pay is higher and his work more severe than usual. There is therefore a vast field open for an increased consumption of beer in agricultural districts, and to some extent also in manufacturing. There is, moreover, room for a very considerable reduction of the receipts or profits of the retailer per barrel, which would be lowered by competition at the same time that a larger draught would compensate him. Competition also would prevent the brewer from appropriating the amount of the reduction of the Malt-tax. Without an open and unrestricted trade, both in brewing and retailing, such a reduction would be ineffectual; and it may be questioned whether the total repeal of the Malt-tax would greatly diminish the price of beer, if the sale were much restricted. Private brewing would, however, to a certain extent operate as a check upon overcharge by the wholesale brewer, and if he failed to supply good and cheap beer, the advantage of brewing for himself would be open to the agricultural labourer; but it is in vain to propose or to rely upon the repeal of the Malt-tax, for if the labourer was to wait for his cheap beer till the duty on malt is repealed, it is very doubtful whether the man is now living who will enjoy it. If the consumption of beer were to be as general and extensive as I suppose, it may be asked, Whence can the requisite supply of barley be derived? If inferior barleys could be malted with advantage, the quantity of barley might be doubled in England. I reply that inferior barley (which I am informed would double the quantity) would be malted and become productive of duty, and then there would be different prices of malt according to its quality; and if that be insufficient, a supply of malt must be obtained from foreign countries subject to duty. The result of Free Trade in beer concurrently with a partial reduction of the Malt-tax, would be that the revenue would sustain no loss; the brewers, who rely upon the quality of their beer and not upon the possession of public-houses, would have the advantage of fair play and no

favour; the labourer would be supplied with good beer at such a price as would be within his means to buy, as an item of his daily food and without injury to his family; a profitable employment would be open to many as retailers in every parish; and the beer would no longer become flat by its being carried a considerable distance as at present. Temperance on principle would take the place of compulsory abstinence, which must not be mistaken for sobriety; and, thus, what I am desirous to promote would be accomplished—the use of malt liquor would be substituted for the abuse.

Mr. SEWELL READ, the chairman, reiterated what had been stated about the farmers not being at one on this question. If they were uniformly to demand it throughout England, they would soon get rid of the tax. But even in Norfolk there were differences of opinion amongst farmers. Three gentlemen in Norwich Corn Hall on the previous Saturday, and two at Lynn on Tuesday, said to him exactly the same thing—namely, "We have got a pound for our barley. Let the Malt-tax alone." Now, he protested against this style of argument, because it was based on ignorance. Let those gentlemen be asked, how they should like a similar tax upon flour, and how that would affect the price of wheat. It would depress the value of all wheat, and in all probability make ordinary wheats unsaleable. A great many farmers had this year, to his knowledge, grown decent malting barley; and where it was sold as malting barley, the malt duty paid upon it exceeded considerably the rent paid to the landlord. Last year, 195,000 acres were grown with barley in Norfolk; and he believed there was not a single coomb of barley grown in the county but what would have made very good beer. Supposing that was all used for malting purposes, they would pay in Norfolk alone upwards of £900,000 to the Malt-tax. Thus it was seen that the tax pressed so unfairly upon one portion of the country. Why should their particular and best produce be taxed in this manner, while almost all other agricultural produce was free? Mr. Gann, in one portion of his excellent paper, had suggested where the barley should come from. That would undoubtedly be wanted in case the Malt-tax were abolished. In Great Britain was grown 3,500,000 acres of wheat, and only 2,300,000 acres of barley. He was positive that they might, if there were a uniform good price for barley, grow just as many acres of the latter as of the former. What Mr. England had said about the steam plough and clayey lands was decidedly true. The occupier of strong lands would now be able to grow a larger portion of barley with the aid of artificial fertilizers on their wheat stubbles. There had been perhaps too many public-houses even in Norwich as well as in Liverpool. He did not exactly know what restrictions were put upon their number; but there was quite a different thing in selling beer like bread and butter over the counter to selling it at a public-house. There need not be any restrictions placed upon that sale except good police regulations, and they, as a Chamber of Agriculture, ought to go more for the free sale of beer over the counter for the labourer, than say many words about the public-houses.

PARTY POLITICS AT AGRICULTURAL MEETINGS.

—At the annual meeting for the revision of the rules and prize lists of the Bedfordshire Agricultural Society, at Bedford, the president, Mr. James Howard, M.P., in the chair, the subject of politics being discussed at the annual dinner of the society was warmly debated, and the meeting unanimously resolved that in future party politics should be rigorously excluded. It was urged that if the county members wished to address their constituents, they should follow the example of borough members, and hold a special meeting for that purpose. The chairman and others held that, although the practice had become common throughout England for county members to avail themselves of the meetings of the agricultural societies for addressing their constituents, it was nevertheless a prostitution of such meetings, and altogether foreign to the objects for which they were founded—*viz.*, the promotion of agricultural improvements. The Earl Cowper, K.G., has accepted the presidency of the society for the present year.—[This appears to be a very sound conclusion; but of course a strong line must be drawn between the politics of Party and the politics of Agriculture.—*EDITOR F.J.H.*]

INDIVIDUAL PROVIDENCE FOR OLD AGE.

At a weekly meeting of the Society of Arts, a paper on "Individual Providence for Old Age as a National Question" was read by Mr. George C. T. Bartley, Treasurer of the Society. The Earl of Derby in the chair. The theatre was crowded.

Mr. BARTLEY read his paper, the heads of which are as follows: 1. On the means which now are in active operation, and are understood more or less by the industrial classes, for encouraging habits of providence, and how they are made use of; 2. How they fail to provide for old age; 3. On the means which do exist for enabling a man to put by, in small weekly sums, for old age; and 4. On the means which it seems desirable should be taken to encourage providence for old age, and to make known among all classes the facilities which exist for this purpose. To secure the ends he was aiming at, he thought that these arrangements would be desirable: 1. That an association of large firms, employers of labour, and the leading members of the industrial classes, be formed, to extend information amongst all persons as to the facilities afforded by the Post-office, and other means which exist for encouraging individual providence, and the benefits to be derived therefrom. 2. That firms and houses of business be urged and assisted by this association in forming on their premises offices for the receipt of proposals for annuities, &c., and the receipt of premiums. That persons be encouraged to allow the premiums to be deducted regularly from their wages, and that arrangements be made for systematically carrying this out. 3. That the association adopt the idea, and try to promulgate it, of regarding a man's policy of insurance, annuity documents, or any proof of providence, as part of his character in seeking employment, and endeavouring gradually to spread the system of considering some such provision as a regular condition of employment in new appointments.

Dr. STALLARD recommended house to house visitation by the middle to the working classes.

Mr. DUDLEY BAXTER said that the scheme brought before them was a system of making provision for old age by a very elaborate machinery. Was that elaborate machinery—the system of week-to-week continuity through life—the best system for the working classes? He for one did not think it was. The system advocated was one of life assurance or annuities, either through benefit societies, savings' banks, or that involuntary voluntary organization of which they had heard so much. But all that required continuous effort from the age of say 20 to 55 or 60; and the working man was not likely to be able to make such an effort. He did not, indeed, wonder that only 339 persons out of 30 millions had availed themselves of it. Another reason why a system good in theory was not available in practice for the working classes was that investments in Government securities produced a very low rate of interest. There should be immediate return to attract the poorer classes. The practical solution of the difficulty appeared to him to be not so much the encouragement of an elaborate system of annuities as of a habit of laying up small savings with a view to their being invested in good securities—houses or lands. He regarded building societies as a great advantage to the working classes, because by their means they obtained good security for their money, either by living in the houses, letting them, or dealing in plots of land. The suggestion, he thought, deserved consideration, and he hoped that by every possible means the working classes would be advised and urged to make small weekly savings and profitably to invest them, as being a way of making provision for old age.

Mr. E. W. HOLLOND advocated the extension of the hours during which Post-office Savings' Banks were open for the receipt of deposits, the present hours of 10 a.m. to 4 p.m. being most inconvenient for the working classes.

Mr. GEORGE HOWELL said that the working classes were accused of not making provision for old age through ignorance and indifference. He maintained that inability to do so was the true cause. How, he asked, could the labourer in towns, or the agricultural labourer lay by any amount of money for old age? If they had anything to spare they put it aside for a time of sickness or enforced idleness. The skilled workman

had reasonably good wages, but not sufficient to make the continuous effort advocated. During 13 years he had had himself wages ranging from 36s. to 40s. a-week, but when he made allowance for loss of time, want of work, and sickness, the average was only £1 0s. 9d. What was required was some organization whereby savings could be readily invested at interest and be available for a time of sickness and want of work. He hoped the day would come when it would enter the mind of some practical statesman to apply the building society system to the Post-office Savings' Banks. What the working classes required was the ability to save, and not the will.

Sir CHARLES TREVELYAN feared that the habit of providence had disappeared from amongst us, if indeed it ever existed in this country. He had within the last few weeks gone through with committees of poor-law guardians and officers, clergy, district visitors, and sisters of charity, entire lists of the poor of one parish and the greater part of another, and he found it was hardly possible to trace any appearance whatever of savings. If it did exist at all it was almost confined to former domestic servants. The increase of wages went rather for harm than good, the sums spent in drink amounting to the revenues of many kingdoms. In truth, for many years we had been living contrary to the first law of God, which was that we should earn our bread by the sweat of our brow, and from this law the poor-law system exempted the people (No, no). The administration of many charities was such as to pauperise the poorer classes, and the entire system needed reform. Instead of giving legal private charity, with both hands open, there should be previous and full investigation to ascertain whether the person applying had done the best for himself or herself ("Question"). The existence of great national improvidence was not caused by any want of ability on the part of the working classes to make provision for old age, and this fact, he thought, would be ascertained by all who thoroughly investigated the subject.

Mr. JOHNSON feared that to inculcate the principle of self-providence would eventually lead to selfishness.

Sir JAMES SHUTTLEWORTH said his experience lay on the two sides of the question. Nearly forty years ago he was engaged in introducing the poor-law system into districts where wages were at the lowest rate, and he lived in Lancashire, where wages were at the highest. He could not say that many labourers in the North were not distinguished by their providence. Within twelve miles of his house £750,000 had been invested by the working classes in co-operative mills, besides a vast sum in co-operative stores. But there was a vast proportion of the labourers of the county who could not make provision for old age. Much might be done by lessening improvidence, much by the saving of £70,000,000 at least out of the £100,000,000 spent annually in drink, much by a reform of charity administration. But it was not to any of these, but to all, they should look, and not to a simple economic problem, to remove the great evil which admittedly existed.

Lord DERBY said: Probably you will expect that, as chairman, I should say a word or two. I confess I do so with some difficulty. The subjects which have been touched on are so vast that, with thought and preparation, one could talk about them for five hours; but without, it is really very difficult to talk about them for five minutes. I think there is no resisting the conclusion to which different speakers have come—that in this matter of economy and prudence we stand rather low in the scale among European nations. The French are undoubtedly before us. There are no persons in the world who are more thrifty than the peasant farmers and small proprietors and the small traders in the towns of France, who together make up so large a proportion of the French population. The Swiss, too, are before us; so also are the Dutch; so undoubtedly are the Northern Italians; and, but for the very sincere respect which I entertain for whatever falls from Mr. Dudley Baxter, I should be inclined to think that the North Germans are in the same ease. If any one asked me what is the cause, or rather what are the causes, of this state of things, I

should be very much perplexed to give him a solution of them. Perhaps there is something in the fact that from our colonising and commercial habits, from our wide-spread commercial relations with all parts of the world, we have been in the habit as a nation of making money faster than our neighbours, and that there is always a tendency to spend rapidly that which has been easily obtained. Well, again you have a not inconsiderable class amongst us—artisans who combine a very high development of skill in their special industry with very low general culture. That is the class of man who spends all he gets. He does not save, not from any particular objection to saving, but because the idea of doing so has never got into his head. He has, perhaps, maintained his parents in their old age, and he thinks it is very natural that in his old age his children should maintain him. Perhaps there is this further explanation. I think it will be found that there is in all classes of society (although among a very small majority) a lingering feeling that there is something mean and selfish in the habit of saving. I have heard that language used by educated men, and it has this infinitesimal truth, that people who set about making provision for their own future are very apt to overlook the claims of their neighbours. There is another cause. You will have observed the infinite amount of injury locally done by the failure of savings banks and associations of all kinds in which the savings of the poor man were invested. It is intolerable for the poor man who has for twenty years perhaps piqued himself upon his savings, while his neighbour, who did not save, was enjoying himself, to see that he has not only lost the pleasure which he might have had, but his money also. I am aware that this is less likely to occur under the present system in respect to savings banks; but this I say, that a single failure of that kind is a lesson of improvidence taught to a whole neighbourhood. Well, as to the scheme of to-night, which I take to be that employers should require those whom they employ to make provisions for their old age, I think it is open to this criticism—namely, that such employers must have the command of the market to a greater extent than is actually the case. You cannot make a provision of the kind unless you have command of the market, and therefore you cannot dictate to the employed what terms you please. It is not practicable, except in rare instances, unless you are prepared to pay to those who adopt your scheme a higher rate of wages than generally rules in the neighbourhood, and in that case, although you talk of it as if the men were laying by for themselves, it is not so, for it is you who are laying by for them. And thirdly, it is not practicable, unless you find that the men you employ are willing to come into a scheme of the kind; and that, I apprehend, as men's feelings are now, they would not be very likely to do, because they dislike, as we all know, interference of any kind with their private affairs—and interference of this kind is probably not such as would recommend itself to their feelings. No doubt, too, those great associated unions which have exercised one way or another so much power would be extremely jealous of any interposition of that kind on a great scale on the part of the employers. But while I differ as to the remedy, I quite concur as to the extreme importance of the subject. The creation of provident habits is a matter of national as well as of private interest. Saving men are safe men—while men who make a row and head mobs, and make themselves generally unpleasant to their neighbours, are generally those who have not got a shilling laid by for a rainy day. No doubt economy, like everything else, may be carried to an extreme, but it is not an extreme which we are in any danger of running into in this country. The difficulty is the other way. Dr. Stallard says very rightly that we want somebody to set the example. That is true. But, unfortunately, when you get a man to set an example in a neighbourhood you generally find that he is the most unpopular man going. Now, this question of individual prudence and provision for old age opens the infinitely wider question of the operation of the poor-law, and of all laws in the nature of the poor-law, and their effect upon the formation of individual character; and as to that, perhaps I should say that there is no subject on which we require more to be taught to reason quietly and calmly, or on which we are liable to fall into one of two extremes. Sometimes we take the compassionate fit, and then we are in the habit of talking the wildest socialism, although we do not mean it. Sometimes we take the economical fit, and we talk that which, if acted on—happily it cannot be—would be apt to bring about a revolution

in less than 50 years. The question of enforcing providence is a very difficult one, and the difficulty increases when those who are alive to the importance of the subject are well off, while those who have to receive advice upon it are those who themselves create the existing difficulty. It is very well to say that men are to be made more than they are responsible for the way in which they have chosen to live. Well, if you could deal with the man himself, that would be right enough. Nobody, I suppose, would feel very much for a man who has been utterly improvident and reckless, and who has brought a certain amount of discomfort upon himself in his latter days. The difficulty is that the man who is in fault is one person; those who suffer are others. It is not the man himself. He is dead or disabled. It is his wife and children upon whom the penalty falls, and it is very hard to say in that case that because he was in fault you will not help them. At the same time, if you look at the other side of the question, it is quite evident that if every man had a perfect assurance that, although he made no provision for his family, they would be none the less made comfortable by society in general, there would be almost an end to individual saving. It is not, therefore, an easy problem to solve. You must rely, I think, more on hope than on fear. You cannot tell a man that if he does not lay by, his children will starve, but you may tell him that if he does they will be in a much better position than if he does not. Something was said to-night about the impossibility of expecting the working classes in the agricultural districts to lay by, and I am afraid I must agree with that. But they are not the whole. They are not perhaps more than the bare majority of the class paid by weekly wages, and anyone who knows the position of the artisans in our manufacturing and other great towns cannot doubt that they have abundant opportunities of laying by. The manufacturers have been coining money during the last two or three years, and wages have been higher than at any former period, but I am afraid that the amount of money remaining in the hands of the workers is not very large. My conclusion is a very simple and humble one. I do not think any scheme, however well devised, would be more than a palliative of the evil which we all admit. The whole question is one of national character. We have been improvident, and I fear we always will. You cannot change national character in a day—you may in a generation or two; and all you can do is to keep public attention fixed upon those matters, and to give every encouragement which the state of society reasonably and fairly can give to the working classes to lay by and make provision for a time of need.

THE WANDSWORTH INFIRMARY FOR ANIMALS.

—A new building has just been opened near the Nine Elms Station in the Wandsworth-road, out of the proceeds of a bequest by the late Mr. T. Brown, of Rosely-hill-park, Dublin, who by his will bequeathed to the University of London a certain amount of stock in the Three per Cent. Consolidated Bank Annuities, together with the residue of his personal property, for the purpose of "founding, establishing, and upholding an institution for investigating, studying, and without charge, beyond immediate expenses, endeavouring to cure maladies, distempers, and injuries any quadrupeds useful to man may be found subject to." The institution was to be established within a mile of either Westminster, Southwark, or Dublin: to be presided over by a professor or superintendent, who should give at least five lectures annually free to the public. The buildings which have just been completed and opened, and which are called the Brown Animal Institute, cover an area of an acre and a-half of ground, and consist of three blocks. The first is for the accommodation of animals under treatment and observation, and consists of a five-stall stable, five other separate rooms, a dead-house, and post-mortem room, and a stove for cooking the animals' food, and there is also a dog-kennel in a semi-detached building. The second block contains the chemical laboratory, the private room of the professor superintendent, and an apparatus room, in which is a furnace and other arrangements for making scientific observations. The third block contains the rooms of the resident officers. Dr. Sanderson has been appointed the professor superintendent, and will deliver the lectures. The arrangements provide for the public sending sick animals to the institution for treatment by merely paying incidental expenses, whilst the labours in the laboratory will include the studies of the cattle-plague, small-pox, pleuro-pneumonia, foot-and-mouth disease, and other ailments to which animals are liable.

FARMING IN IRELAND.—A DAIRY FARM.

BY THE NORTHERN FARMER.

Having in these columns already described the working of a farm on which a fixed rotation is successfully carried out, corn and green crops largely grown, and cattle finished in the best manner on the latter, for the English and home markets, I now propose illustrating the subject still further, by describing the working of a farm in the same county on which corn-growing is reduced to a minimum, being confined to the field which must of necessity be broken up for green crops, and that on which they have been grown during the previous season, the dairy, rearing young stock, and a flock of well-bred ewes, constituting the branches of industry principally depended on as sources of profit. It will be observed that such a mode of farming does not comprehend the extreme view taken by a large section of agriculturists, ignoring labour, and altogether excluding the growth of root-crops, but it appears to me that it strikes a happy medium, lowering the weekly expenses for labour, and in a corresponding degree all the other outgoings of the farm, without seriously interfering with its receipts. A system that admits the necessity of winter food, and makes preparation for it in due season, growing the crops which a bountiful Providence has placed within reach of the tiller of the soil, is based on sound principles, and can scarcely fail of proving financially successful. The constant and continually increasing demand for fairly-bred, well-conditioned young stock that now exists in these kingdoms places the farmer who breeds and rears extensively in a very safe position. Once fully stocked his purchases need consist but of a sire or sires according to the extent of his herd, these sires, if judiciously purchased, losing nothing when sold to the butcher, and giving their services, often invaluable, for nothing more than the food they consume while on the farm. Much annoyance, loss, and uneasiness of mind is thus avoided, and attendance at fairs is confined to one object, viz., the disposal of surplus stock. To keep cattle in such condition as that they may be got rid of at paying prices at any season, a considerable breadth of root crops must be grown, the supply of food thus gained enabling their owner to preserve his stock in an improving condition from the earliest period of their existence, and to obtain the highest value going for animals of their class on the day they leave the farm.

In elucidation of these principles I proceed to describe the working of a dairy and stock rearing farm in the county of Cork, with the management of which I had recently an opportunity of becoming acquainted, every particular having been shown or described. This farm has none of the natural advantages possessed in such a large degree by the one I have already described, being rather light, and for the most part resting on a hungry gravel, which quickly eats up whatever manure is placed upon it, requiring very frequent applications of farmyard dung to keep it in anything like heart. A dry summer tells very soon, burning up the herbage, depriving it of succulence, and very speedily placing the stock on such a short allowance of food as to necessitate assistance from some other source than the supply obtainable from the pastures. Such land may at first sight appear but ill adapted for the profitable working of a dairy stock. And so, indeed, it would inevitably be were arrangements not made to provide a supply of food sufficient to furnish a morning and evening feed during the whole of the time the cows

continue to occupy the pastures, never omitting it even once. At no season of the year is hay largely used in feeding cattle of any kind, it being (quite contrary to the opinion of a numerous class of Irish agriculturists) considered considerably more expensive than roots, in consequence of its extensive and repeated growth scourging the land, injuring the roots of the grasses, and seriously affecting the succeeding year's pasturage. Turnips, on the contrary, improve the soil on which they are grown, the high manuring which a heavy stock gives an opportunity of applying, and the cleaning and grubbing given in the working of the crop, completely renovating the soil, and preparing it for forcing as good grass for a few subsequent years as the nature of the soil will permit. This farm contains about 400 acres statute measure, and in the first week of November, 1871, the live stock consisted of 56 in-calf cows and heifers, 26 two-year-olds, 32 yearlings, 200 breeding ewes, 17 horses of all ages, and a number of pigs. It may well be conceived that such a number of mouths required a considerable bulk of food for even one day's consumption, and a good deal of care and anxious consideration required to be exercised to prevent the supply of one variety of food falling short before the season was sufficiently forward to furnish abundance of that meant to succeed it. The whole of the milking stock were originally Ayrshires, imported direct from the district from which they derive their well-known designation; but the demand for young stock of bigger bone and greater substance than this breed can attain to, seems likely to throw them out of fashion, not only on this farm, but in whole districts to the west of the county, where at one time it was supposed they had merit enough to supplant every other breed. Bulls of pure Shorthorn descent having invariably been used here, the young stock from half-bred cattle now begin to assume the aspect and substance of the Shorthorn, and to show more of the distinctive qualities of the latter than of the Ayrshire. The difference in value of a pure Ayrshire heifer and a half or three-quarter bred Shorthorn on exactly the same keep from the day of their birth to the day of disposal, and sold in merely store condition, is estimated to be not less than £3 for each year. Thus, a yearling Ayrshire bringing £5, the Shorthorn cross from the same pastures will easily bring £8, and be in considerably greater demand, the former as a two-year-old bringing £10, the latter will without difficulty realise £16. On a farm rearing forty calves each season, such a marked difference becomes a matter worthy of the most serious consideration; and, however favourably the Ayrshire may be regarded on account of her hardiness, economical consumption of food, and acknowledged superiority as a milker on indifferent pastures, she yet must give place on all farms where proper shelter is provided, and where liberality of feeding is the rule and not the exception, to her powerful rival the Shorthorn. The calving of the cows is so arranged as to constitute what is usually styled a summer dairy, this in a country district being found the most profitable and convenient arrangement. Extensive butter-making during the winter months entails a vast amount of extra trouble, and good quality being so hard to obtain when the stock are principally maintained on roots, much annoyance is avoided by the majority calving in spring. For the sake of the calves it becomes desirable

to have the period of parturition as early in the season as possible, it being found from experience that those dropped in February and March maintain a precedence in size and value over those calved in April and May, not explainable on the mere ground of a few weeks' difference of age. The whole of the milk is set for cream, from thirty-six to forty hours being the maximum time it is permitted to stand before skimming during the heat of summer, it being scarcely possible to ensure first qualities if allowed a few hours longer. The advantages of skimming early are here considered to be many. First of all, during very warm weather, the cream rises quickly, and the whole of the produce as nearly as possible is got in the time specified, while the milk, still retaining its sweetness, is much more valuable for calves than when withheld until decomposition has commenced. The butter, salted and packed in firkins, is forwarded to the Cork Butter Exchange, to be there classed and branded for exportation. Singularly enough, the farmer or produce, whatever his rank as an agriculturist, by the rules of this great exportium for the collection and diffusion of dairy produce to every part of the world, cannot sell direct to the export merchant, but must consign it to a broker, who pays the farmer for it at the published price of the day, charging 1s. a cwt. commission on the transaction on his own account, and 2s. on the part of the merchant, so that the producer pays 3s. per cwt. commission for the convenience which he cannot or rather will not be permitted to do without. Some men grumble at existing arrangements, and occasionally dispose of their butter elsewhere for a brief period, but in the end are only too glad to return to the home market and place themselves under the protecting wing of the Committee of Butter Merchants. Taking everything into consideration a fairer market for the disposal of dairy produce could not be had, and there can be nothing surer, that notwithstanding all apparent inconsistencies, every man gets the quality for his butter which it actually deserves, and if through greed milk is left down until the cream is rotten, it is hard for the owner of butter so made to expect the same price as is paid for butter made from sweet cream. Repeated disappointments, however, seem utterly unavailing to teach some people common sense, a glance at the market returns, showing each day a large proportion of thirds, fourths, and even fifth qualities, a state of affairs only attainable by the most glaring intentional neglect in the management of the dairy. As has been already noticed, house-foed on such a dry soil is imperatively required every day throughout the year, and an effort is made to meet this want by a little extra attention. It did not appear to me that there was much difficulty apprehended in being able to keep up the supply, nor yet that a very large variety of crops were required, nothing being done but what anybody else could do with ease, making one wonder how house-feeding was not more general than it is—nay, why, in fact, it is not universally adopted, its advantages being so numerous, and so easily ascertained. The principal crops for summer house-feeding are trifolium incarnatum, tares, and the autumn growth of clover, on the land from which hay has been taken. It will be observed that these are the simplest grown of all the crops suitable for this purpose, and they are selected for the obvious reason that, with liberal treatment, they are capable of being forced to an immense bulk per acre; and, requiring no cultural operations, with the exception of the preparation of the seed-bed, the popular feeling against labour is fallen in with to a considerable extent, and yet not to the neglect of highly important and profitable considerations. Taking the summer season to begin on the 8th of May, the first crops ready for cutting are the piece of trifolium and winter tares, according as the

winter may have dealt more or less tenderly with either. By the end of May, the increasing strength of the sun will have so warmed the soil as to force both crops into all the luxuriance the manurial dressing given at seed-time is capable of affording, creating such abundance as to let the cattle depending upon them get as much as they can consume without waste. The autumn-sown crops cleared off, a spring sowing of tares immediately succeeds, an endeavour being invariably made to have it in so early in the season as to be fit to be off in time for white turnips at least. As a fair crop of the latter can scarcely be calculated on if sown later than 20th July, there occurs a few weeks' interval before the second crop of clover becomes available. This is met with the greatest ease by having a reserve of mangel-wurzels held over from the spring. Thirty or forty tons of well preserved roots become at this time of year doubly valuable, keeping the succession unbroken, and linking the finish of one season to the commencement of another in the easiest and most economical manner possible. A rick of mangolds spared from the spring, comes useful in many ways, causing plenty at a period of the year when there is often real scarcity, should the summer chance to be an excessively dry one. If the whole are not required for cattle, they can be utilised by giving to pigs, stores doing well on them, either raw or boiled. By the 15th of August, clover will in ordinary years be fit to cut, giving a morning and evening feed, liberal to repletion, till well on in October. Mangold tops succeed the clover, continuing to give an abundant feed for about four weeks, it being impolitic to endanger the safety of the roots by permitting them to remain in the ground beyond the 20th of November, for the sake of the feeding value of the leaves. The season has now been reached when white and yellow turnips may be given with great propriety, the products of the dairy having become so trifling that superior quality is no longer the exclusive object. The better keeping sorts of roots succeed each other until summer again wears round, the succession thus continuing unbroken throughout the year. As already stated, hay is estimated here at a very high value, and is accordingly not given to dairy cows until they have calved, and the new season again commenced. Bruised furze is used instead, two feeds daily being given for a period of between three and four months. Further on I will describe the growth and preparation of the furze a little more particularly, no less than 15 acres being devoted to its cultivation, horses, cows, and young cattle being fed on it while it lasts.

It will be seen from the above description of how house-feeding is carried out, that it cannot but prove highly beneficial to the farmer who takes the trouble of attending to details, reducing it to a system, and adhering to it rigidly. In the first place it becomes evident that considerably more stock can be kept on the pastures than could possibly be the case where nothing external to what these will afford is provided. The cattle when turned out after being milked are full, and care only to rest, instead of being on foot for the greater part of their time collecting food, which on light undulating land they must unavoidably be where house-feeding is neglected. Their produce is more regular, and in consequence the yearly average is raised considerably, the cows all through a protracted period of great heat or drought being scarcely affected by what under less favourable conditions would nearly run them dry. The manurial condition of the pastures is continually improving, the excretions being not only in greater quantity, but containing the elements of fertility in far greater degree, than when they are compelled to trust to the pastures alone for subsistence.

THE CENTRAL CHAMBER OF AGRICULTURE.

A meeting of the Council of the Central Chamber of Agriculture took place on Tuesday, Feb. 6, at the Salisbury Hotel, Salisbury Square, under the presidency of Mr. Edward Henegge, the chairman for the current year.

Sir M. H. BEACH, M.P., moved addresses of congratulation to the Queen, and to the heir apparent, on the happy recovery of His Royal Highness.

The CHAIRMAN suggested that the address should be carried without a seconder, and by acclamation, which was done.

Mr. PELL, M.P., in the absence of Sir M. Lopes, laid before the Chamber the following report from the Local Taxation Committee:

In presenting this report your committee are glad to be able to point to several grounds of encouragement, which cannot but advance the interest of Local Taxation Reformers in the coming session. The importance of the subject is much more generally admitted, the state of public opinion and information with regard to it very much advanced, and very considerable has been the progress of the question even since the corresponding period of last year, when the committee were enabled to congratulate the Council on the success of the earlier agitation. The continued success of the Metropolitan Poor-Rate League, now including twenty-two London parishes in its organisation, proves that the question is far from being a purely agricultural grievance. The sustained interest and increased earnestness of householders is evidenced by the full attendance at all the numerous meetings of this body in Islington, St. Pancras, Marylebone, Plumstead, Woolwich, and many other parts of the metropolis. The secretary of your committee had recently an opportunity of addressing the Chamber of Agriculture at Hungerford, and the course followed by that Chamber of appointing a local sub-committee to diffuse information and collect subscriptions, is commended to the notice of those districts where a local organisation of this nature is not already in existence. Your committee are gratified to observe that the recent unauthorised disallowances by the Treasury of the costs of criminal prosecutions have been considered by a very large number of courts of quarter sessions, and the vigorous action taken in different counties must help to convince the Government of the feelings of the ratepayers with regard to our anomalous system of local taxation. The decision of the case which the magistrates of Lancashire raised in the Court of Queen's Bench on the 29th of January last was, in fact, a moral victory, and fully confirmed the opinions your committee expressed as to the illegal and unwarrantable conduct of the Treasury officials. The Lord Chief Justice and the Bench unanimously held that the Lords of the Treasury had exceeded their powers, and although the court was unable to compel their lordships to refund the sums in question, it was indicated by the bench that a remedy, which Parliament alone could afford, was urgently required for a state of matters which was described as a "crippling of justice" and "a monstrous and scandalous" anomaly. A return showing the amounts disallowed in boroughs has just been issued, which shows that towns have suffered more heavily even than counties, fully more than 10½ per cent. of the cost of prosecutions in boroughs having been disallowed in the past six years. Your committee are now issuing copies of this return with a circular to town clerks calling their attention to these facts, and asking the co-operation of their Councils in bringing the matter before the Legislature by petition. In turning to the future it seems to your committee that the hands of Local Taxation Reformers would be materially strengthened if a return of all local taxation were laid annually before Parliament at or before the time when the Chancellor of Exchequer makes his financial statement. Chiefly, however, at this juncture your committee would urge on this Council, and on all their supporters, the necessity of continued and mitred resistance to new charges on the local rates, until Parliament has recognised the grievance of the ratepayers by extending the incidence of rating to persons and property now exempt, or by removing imperial charges from the category of local taxes. They would especially point to such objects as militia, lunatic asylums, police, and the admin-

istration of justice, as so essentially matters of imperia necessity, and so very largely controlled by imperial authorities that their transference from the local rates to the Treasury would seem to be an act of justice which cannot be much longer delayed. The return moved for by the chairman of your committee, showing the total expenditure and the amount of the Government subvention under each of these heads, which was alluded to in your committee's November report, has only just been issued. It, however, gives only the amount expended for such purposes in counties, and (contrary to the original intention) does not give this for cities and boroughs as well, and it has become the duty of the chairman to ask for this additional information. As soon as this further return is published your committee trust they will be in the possession of the fullest and most reliable data obtainable with regard to this special portion of their general subject. In indicating certain specific charges your committee in no way depart from their repeated declaration of the national character of other yet larger and heavier local burdens. They cannot, however, omit to point out to ratepayers which of the abuses of our local system of taxation are most readily assailable, and in what directions the prospect is most open to any instalments of the justice which they claim. Your committee recommend, therefore, the concentration in the first instance of the efforts of Local Taxation Reformers on individual charges, and trust that this course, which is suggested by them after mature consideration, will be assented to as being the best policy for insuring the approval of the House of Commons, and most likely to effect an early reduction of ratepayers' burdens. They solicit, therefore, your cordial co-operation in the more definite line of action they have ventured to recommend, and they confidently appeal for personal assistance, and for pecuniary support to all ratepayers, as well as to the Chambers of Agriculture who have up to this time so warmly and unitedly aided them in fighting, *not* the battle of the country against the towns, as has most erroneously been urged, but the battle of the owners and occupiers of all houses and lands against the manifest injustice of exceptional taxation. So anxious is the chairman of your committee that this movement should not lack the material assistance which will doubtless be required to give it a fair prospect of success, that, provided a sum of £2,000 be contributed within the next three months by owners of land and houses in amounts of £100 or £50, he will be prepared to double his present subscription of £100 in order to further the objects the committee have in view. Your committee have to acknowledge with thanks the subscriptions received since their last report.—Massey Lopes, Chairman.

Sir M. H. BEACH proposed: "That this Council, in receiving, approving, and adopting the Report, urges every associated Chamber to strenuously support the policy and course of action indicated in the Report."

Mr. A. STARTIN (Warwickshire), in seconding the motion, agreed that they ought to attack this gigantic fortress in its most vulnerable points, and that to attack details was not a retrograde step. He expressed a hope that, if there were a surplus income this year, the Government, instead of surrendering the house-tax, would be willing to make grants in aid to Boards of Guardians, to the extent of placing upon imperial taxation one-half the charge for indoor relief. Such a measure would be a considerable relief to the ratepayers, and prove a great public advantage in the administration of the poor-law.

The Report was adopted.

Mr. H. GENGE ANDREWS (Somersetshire) moved: "That in the opinion of this Council, many charges now paid from funds raised under the poor-rate assessment ought to be transferred to funds raised by imperial taxation, but that such transfer will not justify the continuance of the exemption from the poor-rate assessment of income arising from personal property."

Mr. C. M. CALDECOTT (Warwickshire) seconded the resolution. He said, referring to the disallowance by the Treasury of expenses which had been passed by the examining officers at assizes and quarter sessions, upon scales fixed

with the sanction of the Home Secretary and the Judges of Assize, that the excuse of the Treasury was that the charges in different counties varied, and that some of them were exceptionally high. It was true that there were considerable variances, and that sometimes the examining officers exercised a strong discretion; but unfortunately the County Treasurer had no power whatever to refuse anything that had been passed by the examining officers, and under the 14th Vict. cap. 55, sections 5 and 6, the Home Secretary was empowered to fix and regulate the charges for every county in England. If, therefore, there were exceptional charges in some counties, the Treasury should represent it to the Home Secretary, who would then call upon the counties to revise their scales of charges and settle them with his approval.

The Rev. Mr. PERRY (Staffordshire) supported the resolution. Mr. CORRANCE, M.P., approved of the resolution as indicating a more practical policy; and he was glad to observe that it was indorsed by one who held such a position as Sir Michael Beach. It encouraged the hope that gentlemen who sat on the front benches in the House of Commons were beginning to take a correct view of the question at issue. In his opinion they would best fight the battle in detail; at the same time that need be no bar to the assertion of the claims which they had hitherto advanced.

Mr. MUNTZ, alluding to the last paragraph in the report, complained that the funds subscribed were in no way commensurate with the work the Chamber had to do, and urged that, in order to show the country that they were in earnest, the landed and agricultural interest ought to give more substantial aid. With the view of setting the example, he was ready to commence the subscriptions by putting his name down for £100.

Mr. HODSOLL (West Kent) contended that the Chamber must not lose sight of the great principle with which they had started. The report in one of the paragraphs insisted on the necessity of continued and united resistance to new charges on the local rates until Parliament has recognized the grievance of the ratepayers by extending the incidence of rating to persons and property now exempt "or" by removing imperial charges from the category of local taxes. He objected to this word "or," for, in common with all old local-taxation reformers, he was anxious above all things that there should be no doubt about their object. Real property was, at this moment, paying 4s. in the pound in imperial and local rates, while all other descriptions of property were paying only 1s. 7d.; thus the basis on which they should stand in the House of Commons was so firm that there need be no dilution of their principles. A manly exposition, then, of the views on which they had started, was the best course that their friends in Parliament could adopt. What they wanted was justice, and thinking people would never be satisfied until the injustice of which they complained had been removed. He trusted, therefore, the Chamber would continue to adhere to its principles.

Mr. H. CLARK (Devon and Cornwall) would have been glad had the report gone further, and suggested that if the Government failed to bring forward in the present session a good practical measure, some influential member of Parliament connected with the Chamber should take the duty upon himself. The question would then be thoroughly ventilated, and the agricultural community would know what was their position, and who were, and who were not, their friends. Speaking from what he observed the sentiment entertained by the farmers of the two great western counties was one of general regret at the withdrawal of Mr. Goschen's proposal to divide local burdens equally between landlords and tenants.

Several members protested against these remarks, and denounced the Government proposal in strong and unqualified terms.

Sir G. JENKINSON, M.P., observed that the case of the agricultural community rested upon the Act of Elizabeth, whereupon

Mr. H. G. ANDREWS rose, and, whilst agreeing with the hon. baronet that the case did rest on that enactment, as proving its antiquity, declared that if the Elizabethan statute had never existed he claimed an Englishman's right to insist upon an equal distribution of burdens. The owner and the occupier were one in reference to these local taxes.

The resolution was put, and agreed to.

The next subject on the agenda-paper being the "Prevention of Contagious Diseases of Animals,"

Sir G. JENKINSON, M.P., then proposed the following resolution: (1) "That this Council having heard the reply of Mr. Gladstone to the second application made to him to receive a Deputation from the Chambers of Agriculture on the subject of the Contagious Diseases (Animals) Act, regrets that the Prime Minister still declines to receive such Deputation, as the subject is of vital importance to the agricultural interests. (2) That as the recent Orders of the Privy Council do not meet the requirements of the case, this Council adheres to the resolutions passed at its meeting in November, to the effect that the failure of the Contagious Diseases (Animals) Act has demonstrated the necessity for compulsory slaughter or sufficient quarantine of all imported foreign animals, and that the Government should make their present inspection of all cattle and sheep previous to embarkation in Ireland, and of all vessels engaged in conveying animals between Ireland and Great Britain as complete and effectual as possible." He regretted very much that the Prime Minister had seen fit to decline to receive an important deputation from the representatives of the Central and Local Chambers of Agriculture. He could quite believe that the right hon. gentleman had at that moment a great many irons in the fire, and possibly some of them would burn his fingers; but he did not consider that a sufficient reason for his refusing to hear the serious grievances of the agricultural classes connected with the contagious diseases of animals and the importation of foreign stock. They all knew that it was idle to expect any further assistance from the department to which they had been referred. Some months ago he himself wrote to that department as strong a letter as he well could write, and he received a very long voluminous answer, containing what appeared to him great inaccuracies and fallacies. He believed that the new regulations issued by the Privy Council last month had done no good, and the Prime Minister having twice refused to receive a deputation from that body, he thought it was now incumbent on them to repeat the resolution which they had passed before.

Mr. C. BRAMLEY (Lincolnshire), in seconding the resolution, said some time ago the agriculturists of his county took steps for carefully watching the importation of foreign cattle at the port of Grimsby, and after that had been done for several months they felt satisfied that it was totally impossible for any inspector to decide after only twelve hours' detention whether or not there were germs of disease in any of the stock that was imported. Such stock had travelled along the public roads, passed close to some of the largest farms in the county, and went by rail to different market towns, and he would ask them, as practical men, whether that must not cause the spread of contagious diseases among animals belonging to this country? There could be no doubt that the principal diseases had been imported, and it was high time that farmers had such protection for their stock as would meet the justice of the case. That was also for the interest of consumers, it being proved by statistics that the production of English meat had been largely diminished by the diseases introduced into this country by foreign stock. The Orders recently issued by the Privy Council might be a great improvement on the preceding ones, but they did not meet the radical evil. The foreigner was still allowed to bring his stock to England, apparently without any restriction, and when it had arrived it disseminated the germs of disease among English stock.

Mr. STRETTON (South Wilts) thought that by the last paragraph of the resolution the council gave its sanction to the principle of inspection; whereas he submitted that that was the chief cause of the mischief. Most practical men were agreed that inspection was entirely fallacious as regarded foot-and-mouth disease. An animal might pass the most competent inspector as being free from that disease, and within four days from that time the germs of disease might show themselves. [A MEMBER: "Four hours."] By retaining the latter part of the resolution, therefore, they would be supporting a system which had proved entirely fallacious. The farmers of the West of England had suffered greatly during the last six months from the importations at Bristol from Ireland. The local authorities of some counties had even petitioned the corporation of Bristol to close their market, but all they had done was to employ an inspector. At the late Smithfield meeting two inspectors reported against thirty-two animals, which were accordingly not admitted; but on the Wednesday and Thursday of the show he saw a number of

animals in the show who were suffering from foot-and-mouth disease, and that appeared to him a sufficient condemnation of the whole system of inspection (Hear, hear).

The CHAIRMAN observed that the objection of Mr. Stretton applied to the whole of the resolution, which was, in fact, a repetition of a resolution already passed.

Mr. STRETTON said he objected to the previous resolution on the same ground.

Mr. WHITTAKER (Worcestershire Chamber) thought it would be impossible to prevent importation from Ireland; and it was questionable whether England did not send disease to Ireland, as well as Ireland to England. All he wanted in that respect was to see the law enforced in Ireland as it was here.

The Rev. Mr. PERRY said Mr. Stretton seemed to assume that foot-and-mouth disease was the only disease to be dealt with, whereas, in fact, there were many others, and the resolution applied to all.

Mr. MASFEN (Staffordshire) concurred in the remark of the last speaker. Foot-and-mouth disease was no doubt a source of great loss and inconvenience, but it did not often cause death. A neighbour of his had lost 425 head of horned stock by disease in the last twenty-one years. Not five of them died from foot-and-mouth disease, and not one from rinderpest. The greater portion of them died from pleuropneumonia, and the tendency of Mr. Stretton's view was to leave that terrible disease to diffuse itself without any check.
